The NASA STI Program ... in Profile

Since its founding, NASA has been dedicated to the advancement of aeronautics and space science. The NASA Scientific and Technical Information (STI) Program plays a key part in helping NASA maintain this important role.

The NASA STI Program provides access to the NASA STI Database, the largest collection of aeronautical and space science STI in the world. The Program is also NASA's institutional mechanism for disseminating the results of its research and development activities.

Specialized services that help round out the Program's diverse offerings include creating custom thesauri, translating material to or from 34 foreign languages, building customized databases, organizing and publishing research results ... even providing videos.

For more information about the NASA STI Program, you can:

- **Phone** the NASA Access Help Desk at (301) 621-0390
- **Fax** your question to the NASA Access Help Desk at (301) 621-0134
- **E-mail** your question via the **Internet** to help@sti.nasa.gov
- **Write** to:

NASA Access Help Desk

Linthicum Heights, MD 21090-2934

Scientific and Technical Aerospace Reports

STAR

Scientific and Technical Aerospace Reports (STAR), is published each month as a major product of the NASA Scientific and Technical Information (STI) Program.

Inside this issue you will find:

- **Front Matter** containing a typical citation and abstract sample explaining the standard format, including codes for ordering reports
- **An Abstract Section** containing citations and abstracts of reports and publications that provide comprehensive coverage of worldwide aerospace-related topics including aeronautics and space science technology. *STAR* lists published and publicly available reports entered into the NASA STI Database during the four weeks preceding publication of this issue. These citations and abstracts are listed by subject categories.
- **An Index Section**
    - Subject
    - Personal author
    - Corporate source
    - Contract number
    - Report number
- **An Appendix** containing a guide for ordering cited reports, registering with the NASA STI Program, and using the available products and services. Additionally, price schedules, phone numbers, and addresses are included in this information packed section.

NASA also sponsors the companion journal, *NASA Open Volumes on Aerospace (NOVA),* which lists abstracts of the open literature on aerospace subjects available worldwide. *NOVA* is for internal NASA use only, available from the NASA Center for AeroSpace Information (CASI).

Entries found in *STAR* are available through the NASA online retrieval service, RECON, and through DIALOG as the Aerospace Database.

The NASA STI Program gathers information through national and international agreements and exchanges and makes this information available to the NASA community and to the public in many forms through various outlets.

For additional information on the NASA STI Program, call the NASA Access Help Desk at (301) 621-0390, or write to:

TABLE OF CONTENTS

AERONAUTICS For related information see also *Astronautics.*

01 AERONAUTICS (GENERAL) 1305

02 AERODYNAMICS 1311
Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery. For related information see also *34 Fluid Mechanics and Heat Transfer.*

03 AIR TRANSPORTATION AND SAFETY 1315
Includes passenger and cargo air transport operations; and aircraft accidents. For related information see also *16 Space Transportation* and *85 Urban Technology and Transportation.*

04 AIRCRAFT COMMUNICATIONS AND NAVIGATION 1316
Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control. For related information see also *17 Space Communications, Spacecraft Communications, Command and Tracking* and *32 Communications and Radar.*

05 AIRCRAFT DESIGN, TESTING AND PERFORMANCE 1317
Includes aircraft simulation technology. For related information see also *18 Spacecraft Design, Testing and Performance* and *39 Structural Mechanics.* For land transportation vehicles see *85 Urban Technology and Transportation.*

06 AIRCRAFT INSTRUMENTATION 1320
Includes cockpit and cabin display devices; and flight instruments. For related information see also *19 Spacecraft Instrumentation* and *35 Instrumentation and Photography.*

07 AIRCRAFT PROPULSION AND POWER 1320
Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and onboard auxiliary power plants for aircraft. For related information see also *20 Spacecraft Propulsion and Power, 28 Propellants and Fuels,* and *44 Energy Production and Conversion.*

08 AIRCRAFT STABILITY AND CONTROL 1321
Includes aircraft handling qualities; piloting; flight controls; and autopilots. For related information see also *05 Aircraft Design, Testing and Performance.*

09 RESEARCH AND SUPPORT FACILITIES (AIR) 1322
Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tubes; and aircraft engine test stands. For related information see also *14 Ground Support Systems and Facilities (Space).*

ASTRONAUTICS For related information see also *Aeronautics.*

12 ASTRONAUTICS (GENERAL) 1323
For extraterrestrial exploration see *91 Lunar and Planetary Exploration.*

13 ASTRODYNAMICS 1331
Includes powered and free-flight trajectories; and orbital and launching dynamics.

14 GROUND SUPPORT SYSTEMS AND FACILITIES (SPACE) .... N.A.
Includes launch complexes, research and production facilities; ground support equipment, e.g., mobile transporters; and simulators. For related information see also *09 Research and Support Facilities (Air).*

15 LAUNCH VEHICLES AND SPACE VEHICLES 1331
Includes boosters; operating problems of launch/space vehicle systems; and reusable vehicles. For related information see also *20 Spacecraft Propulsion and Power.*

16 SPACE TRANSPORTATION 1332
Includes passenger and cargo space transportation, e.g., shuttle operations; and space rescue techniques. For related information see also *03 Air Transportation and Safety* and *18 Spacecraft Design, Testing and Performance.* For space suits see *54 Man/System Technology and Life Support.*

17 SPACE COMMUNICATIONS, SPACECRAFT COMMUNICATIONS, COMMAND AND TRACKING....1333
Includes telemetry; space communications networks; astronavigation and guidance; and radio blackout. For related information see also *04 Aircraft Communications and Navigation* and *32 Communications and Radar.*

N.A.—No abstracts were assigned to this category for this issue.

18 SPACECRAFT DESIGN, TESTING AND PERFORMANCE **1333**
Includes satellites; space platforms; space stations; spacecraft systems and components such as thermal and environmental controls; and attitude controls. For life support systems see *54 Man/System Technology and Life Support.* For related information see also *05 Aircraft Design, Testing and Performance, 39 Structural Mechanics*, and *16 Space Transportation.*

19 SPACECRAFT INSTRUMENTATION **1337**
For related information see also *06 Aircraft Instrumentation* and *35 Instrumentation and Photography.*

20 SPACECRAFT PROPULSION AND POWER **1337**
Includes main propulsion systems and components, e.g., rocket engines; and spacecraft auxiliary power sources. For related information see also *07 Aircraft Propulsion and Power, 28 Propellants and Fuels, 44 Energy Production and Conversion*, and *15 Launch Vehicles and Space Vehicles.*

CHEMISTRY AND MATERIALS

23 CHEMISTRY AND MATERIALS (GENERAL) **1338**

24 COMPOSITE MATERIALS **1339**
Includes physical, chemical, and mechanical properties of laminates and other composite materials. For ceramic materials see *27 Nonmetallic Materials.*

25 INORGANIC AND PHYSICAL CHEMISTRY **1345**
Includes chemical analysis, e.g., chromatography; combustion theory; electrochemistry; and photochemistry. For related information see also *77 Thermodynamics and Statistical Physics.*

26 METALLIC MATERIALS **1355**
Includes physical, chemical, and mechanical properties of metals, e.g., corrosion; and metallurgy.

27 NONMETALLIC MATERIALS **1367**
Includes physical, chemical, and mechanical properties of plastics, elastomers, lubricants, polymers, textiles, adhesives, and ceramic materials. For composite materials see *24 Composite Materials.*

28 PROPELLANTS AND FUELS **1376**
Includes rocket propellants, igniters and oxidizers; their storage and handling procedures; and aircraft fuels. For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power*, and *44 Energy Production and Conversion.*

29 MATERIALS PROCESSING **1379**
Includes space-based development of products and processes for commercial application. For biological materials see *55 Space Biology:*

ENGINEERING For related information see also *Physics.*

31 ENGINEERING (GENERAL) **1379**
Includes vacuum technology; control engineering; display engineering; cryogenics; and fire prevention.

32 COMMUNICATIONS AND RADAR **1382**
Includes radar; land and global communications; communications theory; and optical communications. For related information see also *04 Aircraft Communications and Navigation* and *17 Space Communications, Spacecraft Communications, Command and Tracking.* For search and rescue see *03 Air Transportation and Safety,* and *16 Space Transportation.*

33 ELECTRONICS AND ELECTRICAL ENGINEERING **1394**
Includes test equipment and maintainability; components, e.g., tunnel diodes and transistors; microminiaturization; and integrated circuitry. For related information see also *60 Computer Operations and Hardware* and *76 Solid-State Physics.*

34 FLUID MECHANICS AND HEAT TRANSFER **1408**
Includes boundary layers; hydrodynamics; fluidics; mass transfer and ablation cooling. For related information see also *02 Aerodynamics* and *77 Thermodynamics and Statistical Physics.*

35 INSTRUMENTATION AND PHOTOGRAPHY **1423**
Includes remote sensors; measuring instruments and gauges; detectors; cameras and photographic supplies; and holography. For aerial photography see *43 Earth Resources and Remote Sensing.* For related information see also *06 Aircraft Instrumentation* and *19 Spacecraft Instrumentation.*

36 LASERS AND MASERS **1434**
Includes parametric amplifiers. For related information see also *76 Solid-State Physics.*

37 MECHANICAL ENGINEERING 1443
Includes auxiliary systems (nonpower); machine elements and processes; and mechanical equipment.

38 QUALITY ASSURANCE AND RELIABILITY 1447
Includes product sampling procedures and techniques; and quality control.

39 STRUCTURAL MECHANICS 1448
Includes structural element design and weight analysis; fatigue; and thermal stress. For applications see *05 Aircraft Design, Testing and Performance* and *18 Spacecraft Design, Testing and Performance.*

GEOSCIENCES For related information see also *Space Sciences.*

42 GEOSCIENCES (GENERAL) 1461

43 EARTH RESOURCES AND REMOTE SENSING 1461
Includes remote sensing of earth resources by aircraft and spacecraft; photogrammetry; and aerial photography. For instrumentation see *35 Instrumentation and Photography.*

44 ENERGY PRODUCTION AND CONVERSION 1464
Includes specific energy conversion systems, e.g., fuel cells; global sources of energy; geophysical conversion; and windpower. For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power,* and *28 Propellants and Fuels.*

45 ENVIRONMENT POLLUTION 1470
Includes atmospheric, noise, thermal, and water pollution.

46 GEOPHYSICS 1480
Includes aeronomy; upper and lower atmosphere studies; ionospheric and magnetospheric physics; and geomagnetism. For space radiation see *93 Space Radiation.*

47 METEOROLOGY AND CLIMATOLOGY 1488
Includes weather forecasting and modification.

48 OCEANOGRAPHY 1495
Includes biological, dynamic, and physical oceanography; and marine resources. For related information see also *43 Earth Resources and Remote Sensing.*

LIFE SCIENCES

51 LIFE SCIENCES (GENERAL) 1501

52 AEROSPACE MEDICINE 1504
Includes physiological factors; biological effects of radiation; and effects of weightlessness on man and animals.

53 BEHAVIORAL SCIENCES 1508
Includes psychological factors; individual and group behavior; crew training and evaluation; and psychiatric research.

54 MAN/SYSTEM TECHNOLOGY AND LIFE SUPPORT 1511
Includes human engineering; biotechnology; and space suits and protective clothing. For related information see also *16 Space Transportation.*

55 SPACE BIOLOGY .... N.A.
Includes exobiology; planetary biology; and extraterrestrial life.

MATHEMATICAL AND COMPUTER SCIENCES

59 MATHEMATICAL AND COMPUTER SCIENCES (GENERAL) 1514

60 COMPUTER OPERATIONS AND HARDWARE 1514
Includes hardware for computer graphics, firmware, and data processing. For components see *33 Electronics and Electrical Engineering.*

61 COMPUTER PROGRAMMING AND SOFTWARE 1516
Includes computer programs, routines, algorithms, and specific applications, e.g., CAD/CAM.

62 COMPUTER SYSTEMS 1533
Includes computer networks and special application computer systems.

63 CYBERNETICS **1539**
Includes feedback and control theory, artificial intelligence, robotics and expert systems. For related information see also *54 Man/System Technology and Life Support.*

64 NUMERICAL ANALYSIS **1545**
Includes iteration, difference equations, and numerical approximation.

65 STATISTICS AND PROBABILITY **1556**
Includes data sampling and smoothing; Monte Carlo method; and stochastic processes.

66 SYSTEMS ANALYSIS **1560**
Includes mathematical modeling; network analysis; and operations research.

67 THEORETICAL MATHEMATICS **1561**
Includes topology and number theory.

PHYSICS For related information see also *Engineering.*

70 PHYSICS (GENERAL) **1561**
For precision time and time interval (PTTI) see *35 Instrumentation and Photography*; for geophysics, astrophysics or solar physics see *46 Geophysics, 90 Astrophysics*, or *92 Solar Physics.*

71 ACOUSTICS **1562**
Includes sound generation, transmission, and attenuation. For noise pollution see *45 Environment Pollution.*

72 ATOMIC AND MOLECULAR PHYSICS **1564**
Includes atomic structure, electron properties, and molecular spectra.

73 NUCLEAR AND HIGH-ENERGY PHYSICS **1573**
Includes elementary and nuclear particles; and reactor theory. For space radiation see *93 Space Radiation.*

74 OPTICS **1576**
Includes light phenomena and optical devices. For lasers see *36 Lasers and Masers.*

75 PLASMA PHYSICS **1581**
Includes magnetohydrodynamics and plasma fusion. For ionospheric plasmas see *46 Geophysics.* For space plasmas see *90 Astrophysics.*

76 SOLID-STATE PHYSICS **1592**
Includes superconductivity. For related information see also *33 Electronics and Electrical Engineering* and *36 Lasers and Masers.*

77 THERMODYNAMICS AND STATISTICAL PHYSICS **1606**
Includes quantum mechanics; theoretical physics; and Bose and Fermi statistics. For related information see also *25 Inorganic and Physical Chemistry* and *34 Fluid Mechanics and Heat Transfer.*

SOCIAL SCIENCES

80 SOCIAL SCIENCES (GENERAL) **1610**
Includes educational matters.

81 ADMINISTRATION AND MANAGEMENT **1610**
Includes management planning and research.

82 DOCUMENTATION AND INFORMATION SCIENCE **1612**
Includes information management; information storage and retrieval technology; technical writing; graphic arts; and micrography. For computer documentation see *61 Computer Programming and Software.*

83 ECONOMICS AND COST ANALYSIS .... **N.A.**
Includes cost effectiveness studies.

84 LAW, POLITICAL SCIENCE AND SPACE POLICY **1620**
Includes NASA appropriation hearings; aviation law; space law and policy; international law; international cooperation; and patent policy.

85 URBAN TECHNOLOGY AND TRANSPORTATION **1620**
Includes applications of space technology to urban problems; technology transfer; technology assessment; and surface and mass transportation. For related information see *03 Air Transportation and Safety, 16 Space Transportation,* and *44 Energy Production and Conversion.*

SPACE SCIENCES For related information see also *Geosciences.*

88 SPACE SCIENCES (GENERAL) 1620

89 ASTRONOMY 1621
Includes radio, gamma-ray, and infrared astronomy; and astrometry.

90 ASTROPHYSICS 1624
Includes cosmology; celestial mechanics; space plasmas; and interstellar and interplanetary gases and dust. For related information see also *75 Plasma Physics.*

91 LUNAR AND PLANETARY EXPLORATION 1628
Includes planetology; and manned and unmanned flights. For spacecraft design or space stations see *18 Spacecraft Design, Testing and Performance.*

92 SOLAR PHYSICS 1629
Includes solar activity, solar flares, solar radiation and sunspots. For related information see also *93 Space Radiation.*

93 SPACE RADIATION 1630
Includes cosmic radiation; and inner and outer earth's radiation belts. For biological effects of radiation see *52 Aerospace Medicine.* For theory see *73 Nuclear and High-Energy Physics.*

GENERAL

Includes aeronautical, astronautical, and space science related histories, biographies, and pertinent reports too broad for categorization; histories or broad overviews of NASA programs.

The application of advanced control concepts to air breathing engines may yield significant improvements in aircraft/engine performance and operability. Screening studies of advanced control concepts for air breathing engines were conducted by three major domestic aircraft engine manufacturers to determine the potential impact of concepts on turbine engine performance and operability. The purpose of the studies was to identify concepts which offered high potential yet may incur high research and development risk. A target suite of proposed advanced control concepts was formulated and evaluated in a two phase study to quantify each concept's impact on desired engine characteristics. To aid in the evaluation specific aircraft/engine combinations were considered: a Military High Performance Fighter mission, a High Speed Civil Transport mission, and a Civil Tiltrotor mission. Each of the advanced control concepts considered in the study are defined and described. The concept potential impact on engine performance was determined. Relevant figures of merit on which to evaluate the concepts are determined. Finally, the concepts are ranked with respect to the target aircraft/engine missions. A final report describing the screening studies was prepared by each engine manufacturer. Volume 1 of these reports describes the studies performed by Pratt & Whitney. Author (revised)

HIGH-LIFT SYSTEM AERODYNAMICS [L'AERODYNAMIQUE DES SYSTEMES HYPERSUSTENTATEURS]
Sep. 1993 494 p The 71st Symposium held in Banff, Alberta, 5-8 Oct. 1992
(AGARD-CP-515; ISBN-92-835-0715-0) Copyright Avail: CASI HC A21/MF A04

This report includes the 32 technical papers developed for the High-Lift System Aerodynamics Symposium along with an edited transcript of the Round Table Discussion and a Symposium Evaluation Report. The symposium objectives were to address (1) how the most appropriate high-lift system can be selected; (2) how an efficient design can be produced; and (3) the experimental and analysis techniques which are necessary to explore and enhance the performance of a high-lift system. Thus, although the aerodynamics of high-lift systems was the dominant theme, the very pertinent aspects of weight, simplicity, reliability, and structural and mechanical integrity were an integral part of the Symposium, and were treated in the papers presented. In this sense, this Symposium has attempted to take a broader view of the high-lift system than has been taken by similar conferences in the past. For individual titles, see N94-18416 through N94-18447.

WHERE IS HIGH-LIFT TODAY? A REVIEW OF PAST UK RESEARCH PROGRAMMES
D. S. Woodward and D. E. Lean *In* AGARD, High-Lift System Aerodynamics Sep. 1993 45 p (For primary document see N94-18415 04-01)
Copyright Avail: CASI HC A03/MF A04

Some of the history of the development of slotted high-lift systems is reviewed in this paper. In particular, the National High Lift Programme run in the UK during the 1970's is reviewed in some detail. In addition, the research program in high lift since the completion of the National High Lift Programme is described qualitatively and references given. The contents cover techniques of high lift testing, results of positional optimization of slats and flaps, the derivation of a simple prediction method suitable for use with a project optimization method, and the description, with results, of a method for interpreting aerodynamic and weight data on high lift systems in the context of a complete aircraft. EXPERIMENTAL INVESTIGATION OF FLOW AROUND A MULTIELEMENT AIRFOIL c02
Nafiz Alemdaroglu *In* AGARD, High-Lift System Aerodynamics Sep. 1993 19 p (For primary document see N94-18415 04-01)
Copyright Avail: CASI HC A03/MF A04

This paper presents the results of experimental investigations performed around a multielement airfoil and gives detailed information about the flow in and around the flap-well and slat cavity regions. Measurements are made using pitot probes, hotwire anemometer and laser Doppler velocimeter at a Reynolds number of 0.5 and 0.8x10(exp 6). The results obtained show the complex nature of the shear flows investigated and put into evidence the necessity of accurate modeling of these flows by numerical methods. Author (revised)

Copyright Avail: CASI HC A02/MF A04

In the design of slotted flaps it is attempted to avoid a reacceleration between the trailing edge of an upstream element of the system and the peak velocity of the downstream element, to reach the maximum lift. It is proved that it is possible by means of a numerical procedure based on a vortex distribution. The resulting shapes are then discussed with reference to the application to a real design. Author

CALCULATION OF MAXIMUM AND HIGH LIFT CHARACTERISTICS OF MULTI ELEMENT AEROFOILS c02
Willy Fritz *In* AGARD, High-Lift System Aerodynamics Sep. 1993 12 p (For primary document see N94-18415 04-01)
Copyright Avail: CASI HC A03/MF A04

The flow field around multi-element aerofoil sections possesses a high degree of complexity. Due to the strong interactions between wakes from the upstream elements and the upper surface boundary layers developing on the downstream elements, there are thick viscous layers present over the upper surface of the trailing edge flap. Large regions of separated flow can be present, even for conditions well below maximum lift. Finally, the flow around the leading edge slat can become locally supersonic, even for low freestream Mach numbers, due to the large suction levels induced in this region. The viscous-inviscid interaction methods, which are most widely in use for the prediction of multi-element aerofoil flows, are computationally very efficient, but unable to describe many of the complex flow features present. A more complete description of the physical phenomena can be achieved only by methods based on a solution of the Reynolds-averaged Navier-Stokes equations, in conjunction with a suitable turbulence model. The generation of a suitable computational grid then becomes a major problem. Within the present work, a method to generate suitable block structured grids around multi-element aerofoils has been developed. The Dornier 2-D block structured Navier-Stokes solver has been extended for grids with arbitrary block structure. After very encouraging results for a two-element high lift system at low angles of attack, in this work the method was applied for realistic two- and three-element high lift systems at high angles of attack. NAVIER-STOKES COMPUTATIONS OF TURBULENT FLOW AROUND HIGH-LIFT CONFIGURATIONS **c02**

P. Bartsch, W. Nitsche, and M. Britsch *In* AGARD, High-Lift System Aerodynamics Sep. 1993 10 p (For primary document see N94-18415 04-01)

Copyright Avail: CASI HC A02/MF A04

This paper presents Navier-Stokes calculations of the turbulent flow around two different high-lift configurations, for which experimental data exist. In the calculations, the flow field is considered as of steady-state and two-dimensional. Because of the low Mach numbers, the fluid is treated as incompressible. The solution procedure uses a finite volume method in order to solve the Reynolds-averaged Navier-Stokes equations. The effects of turbulence on the mean flow field are described by the k-epsilon turbulence model. The computational mesh is systematically refined in order to assess numerical solution errors. The results presented in this paper include surface pressure distributions as well as mean velocities and turbulence quantities. If possible, the calculations are compared to experimental data. EFFICIENT SIMULATION OF INCOMPRESSIBLE VISCOUS FLOW OVER MULTI-ELEMENT AIRFOILS **c02**

Stuart E. Rogers, N. Lyn Wiltberger, and Dochan Kwak *In* AGARD, High-Lift System Aerodynamics Sep. 1993 9 p (For primary document see N94-18415 04-01)

Copyright Avail: CASI HC A02/MF A04

The incompressible, viscous, turbulent flow over single and multi-element airfoils is numerically simulated in an efficient manner by solving the incompressible Navier-Stokes equations. The solution algorithm employs the method of pseudo compressibility and utilizes an upwind differencing scheme for the convective fluxes, and an implicit line-relaxation scheme. The motivation for this work includes interest in studying high-lift take-off and landing configurations of various aircraft. In particular, accurate computation of lift and drag at various angles of attack up to stall is desired. Two different turbulence models are tested in computing the flow over an NACA 4412 airfoil; an accurate prediction of stall is obtained. The approach used for multi-element airfoils involves the use of multiple zones of structured grids fitted to each element. Two different approaches are compared; a patched system of grids, and an overlaid Chimera system of grids. Computational results are presented for two-element, three-element, and four-element airfoil configurations. Excellent agreement with experimental surface pressure coefficients is seen. The code converges in less than 200 iterations, requiring on the order of one minute of CPU time on a CRAY YMP per element in the airfoil configuration. Author (revised)

NAVIER-STOKES CALCULATIONS ON MULTI-ELEMENT AIRFOILS USING A CHIMERA-BASED SOLVER **c02**

Donald W. Jasper, Shreekant Agrawal, and Brian A. Robinson *In* AGARD, High-Lift System Aerodynamics Sep. 1993 11 p Sponsored by NASA. Ames Research Center and Cray Research, Inc. (For primary document see N94-18415 04-01)

Copyright Avail: CASI HC A03/MF A04

A study of Navier-Stokes calculations of flows about multielement airfoils using a chimera grid approach is presented. The chimera approach utilizes structured, overlapped grids which allow great flexibility of grid arrangement and simplifies grid generation. Calculations are made for two-, three-, and four-element airfoils, and modeling of the effect of gap distance between elements is demonstrated for a two element case. Solutions are obtained using the thin-layer form of the Reynolds averaged Navier-Stokes equations with turbulence closure provided by the Baldwin-Lomax algebraic model or the Baldwin-Barth one equation model. The Baldwin-Barth turbulence model is shown to provide better agreement with experimental data and to dramatically improve convergence rates for some cases. Recently developed, improved farfield boundary conditions are incorporated into the solver for greater efficiency. Computed results show good comparison with experimental data which include aerodynamic forces, surface pressures, and boundary layer velocity profiles. Author

NUMERICAL SOLUTION OF THE NAVIER-STOKES EQUATIONS FOR HIGH-LIFT CONFIGURATIONS ON STRUCTURED COMPOSITE GRIDS **c02**

T. E. Nelson, D. W. Zingg, and G. W. Johnston *In* AGARD, High-Lift System Aerodynamics Sep. 1993 14 p (For primary document see N94-18415 04-01)

Copyright Avail: CASI HC A03/MF A04

A numerical method is presented for the solution of the compressible Reynolds-averaged, thin-layer Navier-Stokes equations on structured composite grids as applied to high-lift configurations. The method is an adaptation of an implicit approximate factorization algorithm for block structured composite grids. Interfaces between blocks are treated by overlapping the grids and taking one layer of points from neighboring blocks. Turbulence is treated using the Baldwin-Barth one-equation turbulence model. High-lift applications presented for comparison with wind tunnel data include: a NACA 4412 airfoil with NACA 4415 flap, a GA(W)-1 airfoil with a 29 percent chord flap at 30 degree flap angle and two gap settings, and a GA(W)-1 airfoil with 15 percent chord slat and 29 percent chord flap. Good agreement with experimental data is obtained for cases with fully attached flow or small regions of separated flow. For cases with extensive regions of flow separation, the thickness and extent of the separated regions are underpredicted. Author

HIGH REYNOLDS NUMBER CONFIGURATION DEVELOPMENT OF A HIGH-LIFT AIRFOIL **c02**

Walter O. Valarezo (Douglas Aircraft Co., Inc., Long Beach, CA.), Chet J. Dominik (Douglas Aircraft Co., Inc., Long Beach, CA.), Robert J. McGhee, and Wesley L. Goodman *In* AGARD, High-Lift System Aerodynamics Sep. 1993 8 p (For primary document see N94-18415 04-01)

Copyright Avail: CASI HC A02/MF A04

An experimental program has been conducted to assess performance of a transport multielement airfoil at flight Reynolds numbers. The studies were performed at chord Reynolds numbers as high as 16 million in the NASA Langley Low Turbulence Pressure Tunnel. Sidewall boundary-layer control to enforce flow two dimensionality was provided via an endplate suction system. The basic airfoil was an 11.55 percent thick supercritical airfoil representative of the stall critical station of a new-generation transport aircraft wing. The multielement airfoil was configured as a three-element airfoil with slat and flap chord ratios of 14.48 percent and 30 percent respectively. Testing focused on the development of landing configurations with high maximum lift capability and the assessment of Reynolds and Mach number effects. Also assessed were high-lift performance effects due to devices such as drooped spoilers and trailing-edge wedges. The present experimental studies revealed significant effects on high-lift airfoil performance due to Reynolds and Mach number variations and favorable lift increments at approach angles of attack due to the use of drooped spoilers or trailing-edge wedges. However, no substantial improvements in maximum lift capability were identified. A recently developed high performance single-segment flap was also tested and results indicated considerable improvements in lift and drag performance over existing airfoils. Additionally, it was found that this new flap shape at its optimum rigging was less sensitive to Reynolds number variations than previous designs. Author

A viscous-inviscid interaction numerical method for incompressible flows over multi-element airfoils, which is an extension of the numerical method previously suggested for compressible attached or separated or even stalled flows over airfoils, is presented. The robust algorithms of the method are capable now to converge well for attached flows or massively separated flows, such as induced by slope discontinuities of airfoils or slats, or such as induced by stall. The viscous-inviscid approach introduces a self-adaptative viscous grid in both normal and streamwise directions along the displacement surfaces, with everywhere a streamwise grid-resolution of the same order as the separating boundary layer thicknesses, even at slat apexes, which is believed to eliminate any aleatory effect of numerical viscosity. The method is validated with respect to ONERA experiments, on the three-element RA16SC1 high-lift device, with the severe AMD slat-geometry. A realistic non-uniqueness of the separated flow solutions has been exhibited by the calculation method. A satisfactory agreement between theory and experiment is obtained, with the suggested 2-equation turbulence model. Author (revised)

HIGH-LIFT SYSTEM ANALYSIS METHOD USING UNSTRUCTURED MESHES **c02**

K. deCock *In* AGARD, High-Lift System Aerodynamics Sep. 1993 20 p (For primary document see N94-18415 04-01)

Copyright Avail: CASI HC A03/MF A04

A 2D high-lift configuration analysis method is described. The flow model used is based on the Euler equations, discretized on unstructured meshes. The generation of the unstructured meshes is based on the principle of successive grid adaptation with respect to the geometry. This approach makes later extension towards fully integrated grid adaptation with respect to the solution straightforward. The main characteristics of the Euler solver are upwind flux-difference splitting of the convective part of the Euler equations (second-order accurate discretization in space) and four stage Runge Kutta local time stepping. Results obtained with this analysis method are shown for the NACA0012 airfoil and three-element airfoils. Conclusions are drawn. Author

A detailed description is presented of a computational method to predict the aerodynamic performance of mechanical high-lift systems. The Reynolds-averaged Navier-Stokes equations applicable to compressible, two-dimensional mean flow are solved using a cell-centered, finite-volume spatial discretization and an explicit multi-stage to time march to steady-state solutions. The governing mean-flow equations are solved in conjunction with a two-equation, high-Reynolds number k-epsilon turbulence model, this level of turbulence model sophistication being considered as the minimum required to enable an adequate resolution of the complex flow physics. The geometric complexity associated with practical multi-element airfoil configurations is addressed by adopting unconstructed computational grids. Results for the RAE 2822 transonic single-airfoil section are presented, comparing two near-wall treatments for the turbulence-transport equations. Thereafter, a detailed evaluation is presented of the predictive capability of the method, in its current form, by comparison with experimental data for the low-speed, high-lift NLR 7301 airfoil/trailing-edge flap configuration. Results are also presented for the SKF 1.1 airfoil/manoeuver flap configuration over a range of transonic flow conditions, from fully-subcritical flow to supercritical flow with shock-induced separation. The level of agreement between predictions and experiment is encouraging for the cases considered. However, it is concluded that improved modeling of the complex flow physics is required, with the lack of response of the current k-epsilon turbulence model to streamline curvature being a significant limitation on quantitative accuracy around maximum lift conditions. Similarly, procedures to automatically adapt the computational grid to the flow solution would improve predictions over the extended range of conditions associated with the practical operation of a mechanical high-lift system. At the DLR Institute for Design Aerodynamics current research in the area of high lift aerodynamics is directed towards the development of a computational analysis capability for high lift systems. The Navier-Stokes equations are solved with a multigrid method based on central spatial differencing and Runge-Kutta time stepping. Two particular problems are addressed in this paper. The first concerns the calculation of maximum lift for a single airfoil and a clean wing configuration. The accuracy of the basic structured flow solver is investigated by comparing the results with experimental data for two test problems and several flow conditions. Emphasis is placed on the sensitivity of the computed solution associated with turbulence modeling. The second aspect dealt with in the present paper concerns the extension of the numerical method to multi-element airfoils. Both, the block-structured and the unstructured grid approach are investigated in order to explore their specific merits and limitations. Detailed comparisons of the structured and unstructured approach are presented for low Reynolds number laminar viscous flows around a single airfoil, and for the inviscid flow around a multi-element airfoil. NAVIER-STOKES SIMULATION OF FLOW FIELD AROUND A BLOWN-FLAP HIGH-LIFT SYSTEM **c02**

R. Chow, K. Chu, and G. Carpenter *In* AGARD, High-Lift System Aerodynamics Sep. 1993 10 p (For primary document see N94-18415 04-01)

Copyright Avail: CASI HC A02/MF A04

Solution of the Reynolds averaged Navier-Stokes equations is obtained to simulate the flow field around a 13 percent thickness supercritical airfoil slat/blown-flap high-lift system. A stacked-C mesh topology is used in conjunction with the slat and the flap trailing edge streamlines and adapted to accurately locate the strong viscous flow regions. A previously modified PARC2D implicit ADI solver is employed whereby the multiply connected boundary value problem can be treated with a single computation zone. A modeled injection boundary condition was demonstrated to connect transient flap wake vortices downstream of the computational domain. The converged surface pressures and the values of the lift coefficient are compared with the wind tunnel data at M(infinity) = 0.17, Re = 3.4 M for momentum injection coefficients of C(mu) = 0.01 and C(mu) = 0.04, respectively. An extensive European wind tunnel research program on high lift systems has been carried out in the past few years within the framework of a GARTEUR Action Group. To provide a relevant and realistic case, permission was given by British Aerospace to use a section from the A-310 wing from which a 2D airfoil could be derived. A Deutsche Airbus 3D half model of the A-310 aircraft has been used for the 3D test and an airfoil representative of the 59 percent span section has been used for the 2D test. The wind tunnel test program carried out in the major European low speed wind tunnels (ONERA F1 in France, NLR HST and LST in Netherlands, RAE 5 m in UK) was complemented by a full scale flight test supported by Airbus Industries. A wide range of Reynolds numbers and Mach numbers has been covered by the test and a very comprehensive, well integrated and accurate body of data has been generated by this research program. After presenting GARTEUR the paper deals with the Reynolds number and the Mach number effects as well as the correlations between 2D and 3D data and between wind tunnel and flight test results. Tests have been carried out, on a combat aircraft model with high-lift devices, in the DRA Farnborough 5-meter pressurized low-speed wind tunnel. The deflection angle and position of a leading-edge slat were varied and optimum settings established. The separate effects of Reynolds number and Mach number on overall lift coefficient and on the optimum slat setting were investigated. The results show that optimum performance is achieved at a very high slat deflection angle and the performance is strongly influenced by compressibility effects. Author

An experimental investigation into scale effect at low speed and high lift has been carried out in the DRA 5-m, pressurized wind tunnel on a subsonic strike-fighter model equipped with slotted high-lift devices. The attachment-line boundary layer on the leading-edge slat was found to be turbulent on the outboard part of the wing near maximum lift for a range of unit Reynolds number. An adverse Reynolds number effect on maximum lift was measured which correlated quite well with the onset of attachment-line transition. The conditions for onset of transition were not consistent with the assumption of gross contamination by the fuselage boundary layer, the attachment-line boundary layer remaining laminar on the inboard slat to more than double the expected free-stream Reynolds number. It is suggested that this result is due to spanwise variation in attachment-line position, which results in suppression of the disturbances emanating from the root region of the high-lift wing. It is concluded that attachment-line transition is a potentially significant factor in wind tunnel testing of high-lift wings equipped with leading-edge slats. Author

An experimental investigation into the use of half-model testing techniques specifically aimed at high-lift testing has been carried out in the 5 Metre Pressurized Wind Tunnel at the DRA, Farnborough. The aim of the program was to provide an assessment of the extent to which the measured characteristics of a high-lift model might be compromised by, in particular, the existence of a boundary layer on the reflection plane and how any penalties might be minimized. The results suggest that, provided care is taken with experimental technique, good agreement is possible on stall incidence as well as the absolute values of lift, drag and pitching moment. Author

Flight experiments are being conducted as part of a multiphased subsonic transport high-lift research program for correlation with wind-tunnel and computational results. The NASA Langley Transport Systems Research Vehicle (B737-100 aircraft) is used to obtain in-flight flow characteristics at full-scale Reynolds numbers to contribute to the understanding of 3-D high-lift, multi-element flows including attachment-line transition and relaminarization, confluent boundary-layer development, and flow separation characteristics. Flight test results of pressure distributions and skin friction measurements were obtained for a full-chord wing section including the slat, main-wing, and triple-slotted, Fowler flap elements. Test conditions included a range of flap deflections, chord Reynolds numbers (10 to 21 million), and Mach numbers (0.16 to 0.40). Pressure distributions were obtained at 144 chordwise locations of a wing section (53-percent wing span) using thin pressure belts over the slat, main-wing, and flap elements. Flow characteristics observed in the chordwise pressure distributions included leading-edge regions of high subsonic flows, leading-edge attachment-line locations, slat and main-wing cove-flow separation and reattachment, and trailing-edge flap separation. In addition to the pressure distributions, limited skin-friction measurements were made using Preston-tube probes. Preston-tube measurements on the slat upper surface suggested relaminarization of the turbulent flow introduced by the pressure belt on the slat leading-edge surface when the slat attachment line was laminar. Computational analysis of the in-flight pressure measurements using two-dimensional, viscous multielement methods modified with simple-sweep theory showed reasonable agreement. However, overprediction of the pressures on the flap elements suggests a need for better detailed measurements and improved modeling of confluent boundary layers as well as inclusion of three-dimensional viscous effects in the analysis. Copyright Avail: CASI HC A03/MF A04

A quasi 3-dimensional method for analyzing the viscous steady subsonic flow over wings with flaps for high lift is briefly presented. The total iterative procedure combines a 3-dimensional inviscid lifting surface theory with a 2-dimensional surface-singularity method for analyzing multi-element airfoils in a curved basic flow field. This method also includes boundary layer calculations and a model for rear separation. Also, small compressibility effects are accounted for by simple corrections, and ground effects are included by means of the reflected image technique. First attempts to validate the method by a few theory-experiment comparisons are reported.

The results are encouraging but more experimental data are needed for a thorough validation. The computing time requirements of the method are modest. Author

Copyright Avail: CASI HC A03/MF A04

A calculation method based on an interactive boundary-layer approach to multi-element airfoils and wings is described. For two-dimensional flows, the method is applied to three types of airfoil configurations with and without flap wells in order to demonstrate its applicability and accuracy to general high-lift configurations. This method, extensively tested for single airfoils as a function of shape, angle of attack, and Reynolds number, is shown here to apply equally well to multi-element airfoils. The calculation method is also applied to a wing and wing/flap configuration in order to demonstrate its promise for addressing three-dimensional flows. Preliminary results indicate that with further development, the method, as for multi-element airfoils, will also become a practical, accurate and efficient tool for multi-element wings. Author

WAKE STRUCTURE AND AERODYNAMIC BEHAVIOR OF HIGH LIFT AIRCRAFT CONFIGURATIONS DURING UNSTEADY MANEUVERS IN GROUND EFFECT c02

A. Baron and M. Boffadossi *In* AGARD, High-Lift System Aerodynamics Sep. 1993 15 p (For primary document see N94-18415 04-01)

Copyright Avail: CASI HC A03/MF A04

A nonlinear unsteady vortex lattice scheme is used and flight dynamics equations are solved in order to predict the structure of the wakes and the instantaneous distribution of the aerodynamic loads on high-lift aircraft configurations, during general unsteady take-off maneuvers in ground effect. The numerical scheme here presented can treat an arbitrary number of mutually interfering lifting and moving control surfaces having arbitrary planform and camber. Wakes can be released in the flowfield from any of the sharp edges of the lifting surfaces, depending on their planform, aspect ratio and angle of attack, while the effects of the fuselage are ignored in the present formulation. Turbulent diffusion of the cores of the Rankine vortex filaments is regarded as a preeminent factor in a correct simulation of the development of unsteady interfering wakes. A vortex core diffusion model is used capable to deal even with the severe roll-up of the mutually interfering wakes developing close and impinging on the ground. Typical applications of the unsteady vortex lattice scheme are presented, aimed at illustrating the capabilities of the code. Author

The viscous-inviscid interaction transonic numerical method previously defined by the author for computing attached or separated flows over airfoils, including the deeply stalled flows, is extended into a new three-dimensional method for strongly separated flows over wings at high-lift and compressible speeds. The numerical nonlinearly implicit boundary layer technique (direct/inverse), the turbulent models, the grid generation and grid-adaption, the coupling and wake-equilibration algorithms, the inviscid full-potential schemes, are extended in three dimension, with approximation on the viscous equations (2.75D-local). New theoretical results are given on the singularities and characteristic cones of the fully three-dimensional boundary layer in inverse mode. A new 'Massive-separation 2.75D' extension of the 'Semi-inverse' algorithm of Le Balleur for coupling is given and detailed, together with its stability theory. Results are shown for 2D-stall, and for 3D separated flows over rectangular or swept wings, with satisfactory agreement between theory and experiment. A self-adaptation technique of the grid to the viscous effects is displayed. The results demonstrate that the viscous-inviscid interaction methods give a full access to the calculation of three-dimensional separation. Author (revised)

In the course of four decades a large amount of high-lift applied research and development has taken place at the Fokker Company. In the fifties and sixties the F-27 and the F-28 were developed. In the eighties these aircraft were developed further into the Fokker 50 and Fokker 100. In the seventies an extensive R&D program was performed in preparation of a possible successor to the F-28 leading to the F-29 project study. In each case two- and three-dimensional wind tunnel models were investigated in numerous configurations. In the last decade these investigations have increasingly been preceded by theoretical investigations. Where data are available comparisons have been made with flight test data. Of each development program a detailed account is presented. Particular attention is paid to Reynolds-number effects and the interconnection between the high-speed cruise and low-speed high-lift design requirements. Author

HIGH-LIFT RESEARCH: APPLICATION TO THE DESIGN OF THE ATR72 FLAP c05

P. Capbern *In* AGARD, High-Lift System Aerodynamics Sep. 1993 10 p (For primary document see N94-18415 04-01)

Copyright Avail: CASI HC A02/MF A04

Due to slightly reduced Clmax objectives in landing configuration for the ATR72, compared to the ATR42, the high-lift system of the ATR72 is made up of a single dropped hinge flap, whereas the ATR42 was equipped with a double slotted vane type flap. Elimination of the vane has had a beneficial effect in greatly simplifying the high-lift system for the ATR72. This simplification has been achieved while ensuring that Clmax levels are maintained or improved at same flap deflection (up to the value required for landing), and take-off L/D ratio is improved, which has a direct repercussion on operational performance, such as minimum runway lengths and maximum take-off weight. This aerodynamic performance has been achieved thanks to the systematic introduction, since 1985, of numerical methods in the design phase, in addition to the empirical and experimental methods used almost exclusively until then. The ATR72 flap is indeed the first to be essentially designed with numerical methods at Aerospatiale. Beside this, more severe new regulations for turboprop A/C, leading to a restriction in the use of large flap deflections for the ATR42, the effect of the elimination of the vane on Clmax has been numerically investigated for this A/C. This study having shown promising results, some wind-tunnel and flight test verifications were conducted which confirmed the reliability of the numerical tools. The development of new design and analysis methods has been pursued; it has involved, on one hand, an extension of their field of use and the quality of the modeling, and, on the other, a reduction in the design cycle time. The objective was twofold: better optimization of high-lift systems, and, above all, an appreciable reduction in the associated design costs. Author

THE AERO-MECHANICAL DESIGN OF A NOVEL FOWLER FLAP MECHANISM c05

J. R. Mathews *In* AGARD, High-Lift System Aerodynamics Sep. 1993 9 p (For primary document see N94-18415 04-01)

Copyright Avail: CASI HC A02/MF A04

The flow around a 2-dimensional wing and flap is reviewed using inviscid and viscous computational fluid dynamic techniques. In particular, the effect of flap gap is explored. The results indicate that for optimum aerodynamic performance at low flap angles, flap gaps in the region of 2 to 3 percent are required. A novel 4-bar Fowler flap mechanism is described which is shown to give these required gaps for flap angles greater than 3 degrees.

Such a mechanism can be readily optimized for minimum flap overlap at specified take-off flap settings. A comparison of a track and roller arrangement with the 4-bar mechanism indicates significant advantages for the latter. Author

The Boeing YC-14 was designed to perform a 400nm mission carrying a 26000 lb payload and land in 2000 feet on a semi-prepared landing strip. The high-lift system was one that had never been flown before; a upper surface blowing (USB) concept utilizing the 'Coanda' effect. The take-off and landing performance estimates developed from wind tunnel data were completely substantiated in the flight test program. The critical issue of continuing either a landing or takeoff after the loss of one of the two CF6 engines was also proven in the flight test program. The design details behind the performance of the YC-14 are discussed and some of the performance features of the airplane are explained. Author (revised)

HIGH LIFT SYSTEMS FOR TRANSPORT AIRCRAFT WITH ADVANCED AIRFOILS c05
B. Eggleston and R. J. D. Poole *In* AGARD, High-Lift System Aerodynamics Sep. 1993 13 p Sponsored in part by National Research Council of Canada (For primary document see N94-18415 04-01)
Copyright Avail: CASI HC A03/MF A04

This paper describes an on-going program of R&D into the development of high lift systems for future propeller driven regional transport aircraft. The work includes tests of two-dimensional airfoils and flaps, while half models are used for wing integration development. Comparisons are made between earlier commuter airfoil designs and advanced supercritical airfoils capable of NLF (natural laminar flow), using single and double-slotted flap systems in both cases. The advanced airfoils were also tested with a leading edge slat. Some effects of Reynolds number on lift characteristics are reviewed which show airfoils without leading edge slats were more sensitive at the scale of the half model used and that higher Reynolds numbers may be required. The advanced airfoils stalled at lower incidences than the commuter airfoils which are much thicker and better tailored to high lift performance. Advanced airfoils will likely require an additional flap segment to achieve similar lift to commuter airfoils. Leading edge slats gave large increases in maximum lift coefficients (up to 30 percent), which would allow substantial increases in wing loading if needed for the future. The half model development has entailed work on improving the sealing of the fuselage to the tunnel wall to minimize leakage. The paper provides some details of such work on high lift models and also on models used for cruise drag investigations. Author

The design history of a flap system for an advanced amphibious aircraft is presented in this paper. All the most significant phases of the 2D theoretical studies and the experimental 2D and 3D investigations which have allowed to achieve the final geometry of the high-lift device will be described and, hence, the design criteria, the methods of analysis, the choices will be pointed out. Starting from the preliminary design of several flap systems, the development of this project needed a great deal of numerical studies and wind-tunnel tests in order to select, step by step, the most efficient geometries and to optimize the flap configurations. So, different technical aspects involved with these activities will be discussed: the choice of the flap types to be investigated, related to the special aerodynamic requirements of an amphibious aircraft and to the needs of other design areas (structure, weight, production); the geometrical elements effecting the aerodynamic performance of a high-lift device; general problems connected with theoretical and experimental studies of multi-body systems. [RESEARCH AND DESIGN ACTIVITIES AND THE ECONOMIC BALANCE OF MBB] Annual Report, FY 1991 [DAS GESCHAEFTSJAHR 1991]
1991 40 p In GERMAN
(ETN-93-94909) Avail: CASI HC A03/MF A01

Research and design activities and economic balance of the company in 1991 are presented. The integration process of MBB into Deutsche Aerospace was continued in 1991. The French company Aerospatiale and MBB decided to collaborate in a new company christened Eurocopter in order to design and develop helicopters such as the Tiger. The Tornado production program was carried out and 35 aircraft were supplied to the German Air Force in Jan. 1992. The fan ranger program, which is based on the collaboration with Rockwell to JPATS (Joint Primary Aircraft Training System) program of U.S. Air Force and Navy, was started. The second test flight of X-31A, which is a program of cooperation with Rockwell for maneuverability studies, was successful. Space programs such as Eutelsat and ASTRO-SPAS satellites, and the Huygens probe, and defense programs were carried out following the predicted plan. ESA

WBNGRID, A PROGRAM FOR GENERATION OF C-H AND C-O TOPOLOGY GRIDS AROUND WING/BODY/NACELLE CONFIGURATIONS: USER'S GUIDE

Sven G. Hedman and Lars G. Tysell Jan. 1993 91 p Sponsored by Foersvarets Materialverk, Stockholm, Sweden, and National Board for Industrial and Technical Development, Sweden Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(FFA-TN-1992-09; ETN-93-94856) Avail: Issuing Activity (European Space Agency (ESA))

The principles of WBNGRID, a computer program for generation of C-H or C-O topology grids for the discretization of flow fields around configurations consisting of a wing alone or a wing with a fuselage and/or a nacelle, are described. WBNGRID is a development from an earlier grid generation progam MATGRID for wing fuselage combinations. In case the configuration contains a nacelle the grid is divided into two blocks. It is thought that primarily the grids will be used together with the full potential flow solver WBNFLOW which is a two block extension from the one block solver MATRICS (Multicomponent Aircraft Transonic Inviscid Computation System). The files required, some parameters, how to modify the input, and how to run the program are described. An example is also included as a test case. ESA

A STUDY OF THE INFLUENCE OF A DELTA WING GEOMETRY ON THE INDUCED DRAG AT TRANSONIC SPEED (M=0.55) AND HIGH ANGLES OF ATTACK

Georg Drougge Feb. 1993 23 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(Contracts FMV-82260-91-087-073-001; FMV-82260-92-060-073-001)

(FFA-TN-1992-14; ETN-93-94857) Avail: CASI HC A03

An investigation which concerns mainly the effect of variation of the leading edge geometry and droop for a delta wing with given planform is reported. The lift and the induced drag at M = 0.55 at high angles of attack are calculated with a Euler code. It is found that with the leading edge drooping angle increasing over the span and with the nose radius increasing from 0.1% at the root to 0.7% at the tip it was possible to obtain attached flow over the wing for alpha = 17 deg and alpha = 18 deg. This resulted in very high efficiency factors which means low induced drag which in turn, improves the maneuver performance. The effect of viscosity not included in the Euler equations is discussed. ESA

CFD INVESTIGATIONS OF THE HYPERSONIC DOUBLE DELTA WING GRETA: SANGER PROJECT NO. 3.2

Stefan Wallin and Tor-Arne Groenland 31 Mar. 1993 40 p Sponsored by Swedish Board for Space Activities, Solna

(FFA-TN-1992-42; ETN-93-94860) Avail: CASI HC A03/MF A01

The flow field over the double delta wing Greta with neutral flaps, was computed by solving the inviscid Euler equations and the laminar and turbulent Navier-Stokes equations at two Mach numbers, Mach 4 and 7. The Euler computations were made at three different angles of attack, alpha equals +10 deg, 0 deg, and -10 deg, while the Navier Stokes computations were made only at alpha equals +10 deg. The Computational Fluid Dynamics (CFD) were compared to measurements of the integrated forces and oil flow patterns. The flow field over the Greta vehicle is quite complex and is dominated by a strong bow shock and a strong primary vortex in the leeward side of the wing. At the high Mach number a cross flow shock is observed. The inviscid results show one strong vortex in the leeward side while the laminar results shows additional secondary vortices that introduce a couple of separation and reattachment lines. The turbulent flow solutions show a more viscous behavior, with thicker boundary layers and less distinct vortices and separation lines. The oil flow pattern from the wind tunnel experiments looks like something between the laminar and turbulent results. There is a reason to believe that the computational meshes have to be refined to get more accurate turbulent results. ESA

ERROR PROPAGATION EQUATIONS AND TABLES FOR ESTIMATING THE UNCERTAINTY IN HIGH-SPEED WIND TUNNEL TEST RESULTS

E. L. Clark Aug. 1993 100 p

(Contract DE-AC04-76DP-00789)

(DE93-018685; SAND-93-0208) Avail: CASI HC A05/MF A02

Error propagation equations, based on the Taylor series model, are derived for the nondimensional ratios and coefficients most often encountered in high-speed wind tunnel testing. These include pressure ratio and coefficient, static force and moment coefficients, dynamic stability coefficients, calibration Mach number, and Reynolds number. The error equations contain partial derivatives, denoted as sensitivity coefficients, which define the influence of free-stream Mach number, M(infinity), on various aerodynamic ratios. To facilitate use of the error equations, sensitivity coefficients are derived and evaluated for nine fundamental aerodynamic ratios, most of which relate free-stream test conditions (pressure, temperature, density, or velocity) to a reference condition. Tables of the ratios, R, absolute sensitivity coefficients, (partial derivative)R/(partial derivative)M(infinity), and relative sensitivity coefficients, (M(infinity)/R) ((partial derivative)R/(partial derivative)M(infinity)), are provided as functions of M(infinity). A COMPUTATIONAL AND EXPERIMENTAL INVESTIGATION OF INCOMPRESSIBLE OSCILLATORY AIRFOIL FLOW AND FLUTTER PROBLEMS M.S. Thesis

Peter J. Riester Jun. 1993 158 p

(AD-A268748) Avail: CASI HC A08/MF A02

In this thesis several incompressible oscillatory flow and flutter problems were investigated. First, a previously developed unsteady panel code was modified so that systematic comparisons with Theodorsen's classical theory could be accomplished. It was found that the panel code is in excellent agreement with the Theodorsen results. Second, the panel code was applied to the analysis of bending-torsion flutter. Again, general agreement with Theodorsen's flutter predictions was obtained. In the experimental part of the thesis, two flow visualization experiments were performed. First, the vortical flow patterns generated by an airfoil executing harmonic plunge oscillations were visualized. In the second experiment, the interference effects between a stationary airfoil and a small vane executing plunge oscillations were explored. DTIC

AERODYNAMIC CHARACTERISTICS OF A HELICOPTER ROTOR AIRFOIL AS AFFECTED BY SIMULATED BALLISTIC DAMAGE Final Report, Apr. - Dec. 1992

J. G. Leishman Sep. 1993 60 p
(Contract DAAD05-92-C-0114; DA Proj. 1L1-62618-AH-80)
(AD-A269206; ARL-CR-66) Avail: CASI HC A04/MF A01

Tests were made in a two-dimensional insert at the University of Maryland's Glenn L. Martin subsonic wind tunnel to examine the effects of simulated ballistic damage on the aerodynamic characteristics of a UH-60A Black Hawk helicopter main rotor blade section. Tests were conducted on the undamaged blade section, and on the same section with simulated ballistic damage comprising a circular hole with a surrounding portion of the skin removed, exposing the internal honeycomb structure. The structural lift, drag, and pitching moment were measured at small increments in angle of attack up through stall at Reynolds numbers of 10(exp 6) and 2 x 10(exp 6). In addition, tests were conducted over a full 360-degree range in angle of attack for a Reynolds number of 10(exp 6). The measurements were complemented by mini-tuft flow visualization on the upper wing section, particularly near the hole. DTIC

TWO-DIMENSIONAL BOUNDARY SURFACES FOR AXI-SYMMETRIC EXTERNAL TRANSONIC FLOWS M.S. Thesis
Waleed Isa Al-hashel Mar. 1993 69 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A269678) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Investigation of two-dimensional transonic flows is extended to axisymmetric problems. This is of considerable practical interest, for example, with regard to missiles or aircraft engines which approximate much more closely bodies of revolution than two-dimensional bodies. The main concern with axisymmetric flows lies not only with the complexity of the governing nonlinear partial differential equation which is mixed of elliptic-hyperbolic type but also with the lack of a general method for accurately solving this type of equation. We solve the nonlinear transonic equation using the separation of variables technique, which yields two nonlinear ordinary differential equations. The x-dependence can be integrated numerically, and the solution for the r-dependence can be obtained using the expansion method originated by Van Dyke. This works well with only three terms in the expansion. The sonic solution of these equations is obtained analytically since both equations are simple enough to be integrated for this case (M(sub infinity) = 1.0) The small parameter (1-M(sub infinity)(exp 2)) plays an important role in specifying the shape of the boundary surfaces for external axisymmetric steady flow of interest for design. A Navier-Stokes solver was used to compute the inviscid flow to confirm our results in the region over the surface where the small perturbations apply. DTIC

INTERFEROMETRIC INVESTIGATIONS OF COMPRESSIBLE DYNAMIC STALL OVER A TRANSIENTLY PITCHING AIRFOIL
M. S. Chandrasekhara (Naval Postgraduate School, Monterey, CA.), L. W. Carr, and M. C. Wilder (MCAT Inst., San Jose, CA.) 14 Jan. 1993 18 p Presented at the 31st Aerospace Sciences Meeting and Exhibit, Reno, NV, 11-14 Jan. 1993; sponsored by AIAA See also A93-22628
(Contracts MIPR-92-0004; ARO-MIPR-130-92)
(NASA-TM-109380; AIAA Paper 93-0211; AD-268794; NAS 1.15:109380) Avail: CASI HC A03/MF A01

The dynamic stall flow field over NACA 0012 airfoil pitching transiently from 0 - 60 at a constant rate under compressible flow conditions has been studied using the real-time technique of point diffraction interferometry. This investigation using nonintrusive diagnostics provides a quantitative description of the overall flow field, including the finer details of dynamic stall vortex formation, growth and the concomitant changes in the pressure distribution. Analysis of several hundred interferograms obtained for a range of flow conditions shows that the peak leading edge suction pressure coefficient that stall is nearly constant for a given free stream Mach number at all nondimensional pitch rates. Also, this value is below that seen in steady flow at static stall for the same Mach number, indicating that dynamic effects significantly effect the separation behavior. Further, for a given Mach number, the dynamic stall vortex seems to form rapidly at nearly the same angle of attack for all pitch rates studied. As the vortex is shed, it induces an anti-clockwise trailing edge vortex, which grows in a manner similar to that of a starting vortex. The measured peak suction pressure coefficient drops as the free stream Mach number increases. For free stream Mach numbers above 0.4, small multiple shocks appear near the leading edge. DTIC

SEMI-SPAN MODEL TESTING IN THE NATIONAL TRANSONIC FACILITY Annual Status Report
Ndaona Chokani and William E. Milholen, II Oct. 1993 16 p
(Contract NCC1-169)
(NASA-CR-194479; NAS 1.26:194479) Avail: CASI HC A03/MF A01

A semi-span testing technique has been proposed for the NASA Langley Research Center's National Transonic Facility (NTF). Semi-span testing has several advantages including (1) larger model size, giving increased Reynolds number capability; (2) improved model fidelity, allowing ease of flap and slat positioning which ultimately improves data quality; and (3) reduced construction costs compared with a full-span model. In addition, the increased model size inherently allows for increased model strength, reducing aeroelastic effects at the high dynamic pressure levels necessary to simulate flight Reynolds numbers. The Energy Efficient Transport (EET) full-span model has been modified to become the EET semi-span model. The full-span EET model was tested extensively at both NASA LRC and NASA Ames Research Center. The available full-span data will be useful in validating the semi-span test strategy in the NTF. In spite of the advantages discussed above, the use of a semi-span model does introduce additional challenges which must be addressed in the testing procedure. To minimize the influence of the sidewall boundary layer on the flow over the semi-span model, the model must be off-set from the sidewall. The objective is to remove the semi-span model from the sidewall boundary layer by use of a stand-off geometry. When this is done however, the symmetry along the centerline of the full-span model is lost when the semi-span model is mounted on the wind tunnel sidewall. In addition, the large semi-span model will impose a significant pressure loading on the sidewall boundary layer, which may cause separation. Even under flow conditions where the sidewall boundary layer remains attached, the sidewall boundary layer may adversely effect the flow over the semi-span model. Also, the increased model size and sidewall mounting requires a modified wall correction strategy. With these issues in mind, the semi-span model has been well instrumented with surface pressure taps to obtain data on the expected complex flow field in the near wall region. This status report summarizes the progress to date on developing the semi-span geometry definition suitable for generating structured grids for the computational research. In addition, the progress on evaluating three state-of-the-art Navier-Stokes codes is presented. Derived from text

NUMERICAL PREDICTION OF TRANSITION OF THE F-16 WING AT SUPERSONIC SPEEDS Final Report
Russell M. Cummings and Joseph A. Garcia Sep. 1993 52 p
(Contract NCC2-754; NGT-70228)
(NASA-CR-194407; NAS 1.26:194407) Avail: CASI HC A04/MF A01

A parametric study is being conducted as an effort to numerically predict the extent of natural laminar flow (NLF) on finite swept wings at supersonic speeds. This study is one aspect of a High Speed Research Program (HSRP) to gain an understanding of the technical requirements for high-speed aircraft flight. The parameters that are being addressed in

this study are Reynolds number, angle of attack, and leading-edge wing sweep. These parameters were analyzed through the use of an advanced Computational Fluid Dynamics (CFD) flow solver, specifically the ARC 3-D Compressible Navier-Stokes (CNS) flow solver. From the CNS code, pressure coefficients (Cp) are obtained for the various cases. These Cp's are then used to compute the boundary-layer profiles through the use of the 'Kaups and Cebeci' compressible 2-D boundary layer code. Finally, the boundary-layer parameters are processed into a 3-D compressible boundary layer stability code (COSAL) to predict transition. The parametric study then consisted of four geometries which addressed the effects of sweep, and three angles of attack from zero to ten degrees to yield a total of 12 cases. The above process was substantially automated through a procedure that was developed by the work conducted under this study. This automation procedure then yields a 3-D graphical measure of the extent of laminar flow by predicting the transition location of laminar to turbulent flow.

SUPERSONIC JETS FROM BEVELLED RECTANGULAR NOZZLES
Edward J. Rice and Ganesh Raman (Sverdrup Technology, Inc., Brook Park, OH.) Nov. 1993 9 p Proposed for presentation at the Winter Annual Meeting of the ASME Symposium on Flow Acoustics Interaction and Fluid Control, New Orleans, LA, 28 Nov. - 3 Dec. 1993; sponsored by ASME
(Contract NAS3-25266; RTOP 537-02-22)
(NASA-TM-106403; E-8239; NAS 1.15:106403; Rept-93-WA/NCA-26)
Avail: CASI HC A02/MF A01

The influence of nozzle exit geometry on jet mixing and noise production was studied experimentally for a series of rectangular nozzles operating at supersonic jet velocities. Both converging (C) and converging-diverging (C-D) nozzles were built with asymmetrical (single bevel) and symmetrical (double bevel) exit chambers and with conventional straight exits for comparison. About a four decibel reduction of peak mixing noise was observed for the double bevelled C-D nozzle operated at design pressure ratio. All bevelled geometries provided screech noise reduction for under-expanded jets and an upstream mixing noise directivity shift which would be beneficial for improved acoustic treatment performance of a shrouded system. NUMERICAL INVESTIGATION OF THE INCOMPRESSIBLE FLOW AROUND A WING WITH A FIXED SPOILER [NUMERISCHE UNTERSUCHUNG DER INKOMPRESSIBLEN STROEMUNG UM EINEN TRAGFLUEGEL MIT FESTEM SPOILER]
W. Czichowsky 20 Aug. 1991 99 p In GERMAN
(ISL-R-109/91; ETN-93-95121) Copyright Avail: Issuing Activity (Fachinformationszentrum Karlsruhe, 7514 Eggenstein-Leopoldshafen 2, Germany)

A differential method for the numerical solution of Navier-Stokes equations for calculation of time dependent incompressible flow around a wing is presented. The method was based on Chaplygin equation and vortex transport equation with the psi-omega formalism. A coordinates system, numerically established and body fitted, was chosen. The solution of finite stream equations was iteratively obtained for each time step with the successive overrelaxation method. The flow around a wing without incidence, with a spoiler with an angle of 40 deg, and without a spoiler was analyzed. Numerical results give flow structure, pressure distribution, and force coefficients as a function of time for Reynolds numbers equal to 100, 500, 1000, and 5000. ESA

ADAS IMPLEMENTATION OF A PANEL METHOD FOR THE PREDICTION OF AERODYNAMIC LOADS
P. M. Heyma Jun. 1993 57 p Original contains color illustrations
(LR-723; ETN-93-95027) Avail: CASI HC A04/MF A01

New developments and extensions to the Aircraft Design and Analysis System (ADAS) are discussed. ADAS semi automatically generates a finite element model suitable for structural analysis and optimization. Major structural components can be defined. The aircraft loads are determined by aerodynamic forces. For aerodynamic loads, a simplified lift distribution was used. To improve the prediction of the aerodynamic loads, the panelcode O215 is implemented. This panel method computes the potential flow around complex arbitrary configurations. The program requires a quadrilateral panel surface discritization. The same ADAS finite element model was used for the structural as well as the aerodynamic calculations. The panel program O215, the coordinate system setup, the panel partitioning, the way lifting parts are modeled and the system of integral equations are reported. The ADAS Finite Element (FE)-model and the usefulness of the structural mesh for aerodynamic calculations are discussed. The use of a structural mesh for aerodynamic calculations is validated. New subprograms added to the ADAS system are described and some results for a typical transport aircraft are presented. ESA

FEASIBILITY OF A WIND-ELLIPSE CRITERION IN A VORTEX ADVISORY SYSTEM FOR SCHIPHOL AIRPORT
F. R. Polak 7 Oct. 1991 24 p Presented at FAA International Wake Vortex Symposium, 29-31 Oct. 1991 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(NLR-TP-91384-U; ETN-93-94782) Avail: Issuing Activity (European Space Agency (ESA))

The feasibility of a wind-ellipse criterion in a possible future Vortex Advisory System (VAS) for Schiphol Airport (the Netherlands), based on an extensive data collection and analysis concerning 11 months in 1980 and 1981, is investigated. A VAS must enable air traffic control to determine in real time whether or not the large separations during the approach of smaller aircraft behind heavy aircraft have to be applied. A VAS in its simplest form will show the air traffic controller, by means of a red/green indicator, whether the wind vector is inside the ellipse (red light) or outside the ellipse (green light). ESA

N94-18490 Federal Aviation Administration, Washington, DC.
AIRPORT ACTIVITY STATISTICS OF CERTIFICATED ROUTE AIR CARRIERS, 1992 Report, period ending 31 Dec. 1992
31 Dec. 1992 373 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A269042; FAA-APO-93-8) Avail: CASI HC A16

There are some major changes in this publication due to the new T-100 data collection system for U.S. air carriers which began 1 Jan. 1990. The format has been changed to comply with the regulations of 14 CFR 241.19.6 that restrict public disclosure of T-100 detail and summary international data. Non-U.S. airport data does not appear. Data is no longer broken out by domestic or international operations at airports, only system operations are shown. This edition presents the volume of revenue passenger, freight, and mail traffic handled by the nation's large certificated air carriers at each airport served by these scheduled airlines during the 12 months ending 31 Dec. 1992. In addition, a presentation of aircraft departures is shown including detail by aircraft type for total departures performed in scheduled, nonscheduled, and all services. Large certificated air carriers hold Certificates of Public Convenience and Necessity issued by the Department of Transportation (DOT) authorizing the performance of air transportation. Large certificated air carriers operate aircraft with seating capacity of more than 60 seats or a maximum payload capacity of more than 18,000 pounds. Data for charter only, commuter, intra-state, and foreign-flag air carriers are not included in this publication. DTIC

AIRCRAFT FIRE SENTRY. VOLUME 1: SUMMARY Final Report, 17 Aug. 1990 - 17 Aug. 1992
R. M. Mugele, P. T. Dzwilewski, and J. T. Cilke Jan. 1993 61 p
(Contract F08635-88-C-0067)
(AD-A270087; AFCESA/ESL-TR-92-63-Vol-1) Avail: CASI HC A04/MF A01

This report summarizes the development of an Aircraft Fire Sentry (AFS) system. The AFS is designed to automatically detect a fire in the cargo bay of large cargo aircraft, provide an audio and visual alarm locally, and remotely notify the nearest fire department by radio frequency link. The basic design philosophy in developing the AFS was to use commercially available fire detection hardware and radio transmitters/receivers. The finished assembly is to be lightweight and portable. The AFS is to be deployed onboard parked aircraft and left to sense fire stimulus for up to 60 continuous hours in the self-powered mode. A prototype model was designed, built, and tested for performance and reliability. DTIC

DENVER TMA ASSESSMENT
Kelly Harwood and Beverly Sanford Oct. 1993 79 p
(Contract DTFA03-89-C-00023)
(NASA-CR-4554; A-94009; NAS 1.26:4554) Avail: CASI HC A05/MF A01

This report describes the assessment of the Traffic Management Advisor (TMA) conducted at the Denver Center and TRACON, January 11-February 5, 1993. The assessment addressed the effectiveness of TMA for supporting various traffic management activities. At the Center, traffic management coordinators (TMC's) shadowed traffic operations, using TMA to make metering time and internal release decisions. At the TRACON, TMC's accessed TMA in an advisory mode for different planning activities such as staffing, distributing the traffic load, and changing the airport acceptance rate. These different opportunities for assessing TMA provide insight into TMA as a potential communication aid and planning tool. Findings from this assessment indicate that TMA can be used to support traffic management planning and decisions. TMC's at the center were able to use information provided by TMA to determine metering times as well as internal release times. At the TRACON, TMA supported decisions on airport configuration, airport acceptance rate, load distribution, proactive coordination with the center, and staffing. While findings of TMA use are generally positive, it must be kept in mind that this assessment is a snapshot in time. Not all TMA capabilities were assessed, nor were TMC's fully trained and knowledgeable on all features. Feature use will continue to evolve and strategies emerge as the TMC's gain experience with TMA over a variety of traffic situations and their understanding of TMA capabilities broadens with continued training. HIGH EFFICIENCY LOW COST MONOLITHIC MODULE FOR SARSAT DISTRESS BEACONS
Wendell C. Petersen and Daniel P. Siu 29 Oct. 1992 26 p
(Contract NAS3-25712; SBIR-14.03-6642)
(NASA-CR-194234; NAS 1.26:194234) Avail: CASI HC A03/MF A01

The program objectives were to develop a highly efficient, low cost RF module for SARSAT beacons; achieve significantly lower battery current drain, amount of heat generated, and size of battery required; utilize MMIC technology to improve efficiency, reliability, packaging, and cost; and provide a technology database for GaAs based UHF RF circuit architectures. Presented in viewgraph form are functional block diagrams of the SARSAT distress beacon and beacon RF module as well as performance goals, schematic diagrams, predicted performances, and measured performances for the phase modulator and power amplifier. AIRCRAFT ACCIDENT REPORT: MIDAIR COLLISION, MITSUBISHI MU-2B-60, N74FB, AND PIPER PA-32-301, N82419, GREENWOOD MUNICIPAL AIRPORT, GREENWOOD, INDIANA, 11 SEPTEMBER 1992
13 Sep. 1993 84 p
(PB93-910406; NTSB/AAR-93/05) Avail: CASI HC A05/MF A01

The midair collision of an MU-2 aircraft with a PA-32 aircraft about 2 miles northeast of the Greenwood Municipal Airport, Greenwood, Indiana, on 11 Sep. 1992 is explained. Safety issues focused on the deficiencies in the see-and-avoid concept as a primary means of collision avoidance, and the failure of pilots to fully utilize the air traffic control system by obtaining instrument flight rules clearances before takeoff. Recommendations concerning these issues were made to the Federal Aviation Administration, the National Business Aircraft Association, the National Association of Flight Instructors, the Experimental Aircraft Association, and the Aircraft Owners and Pilots Association. The lift-generated wake vortices trailing behind an aircraft present a danger to aircraft following the same or nearby path. The degree of hazard to the following aircraft depends on the nature of the wake encountered in its flight path and on the ability of the aircraft to counter its effects. This report describes the current state of understanding of the factors that influence the motion and dissipation of wake vortices. The relationships of these factors to parameters that are measurable through meteorological sensors and from a priori knowledge of the vortex generating aircraft characteristics are discussed as an aid to structuring development plans for the creation of wake vortex advisory products by the Integrated Terminal Weather System (ITWS) and by special wake vortex sensors. DTIC

04 AIRCRAFT COMMUNICATIONS AND NAVIGATION

Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.

ON THE USE OF DIFFERENTIAL GPS FOR AUTOMATIC APPROACH AND LANDING OF SPACE AND AIRCRAFT
Yusuke Suzuki (National Space Development Agency, Tokyo, Japan.) Sep. 1992 43 p
(DLR-Mitt-93-05; ETN-93-94867) Avail: CASI HC A03/MF A01

The integration of an Inertial Navigation System (INS) with Differential Global Positioning System (DGPS) is investigated with the aim of meeting the critical requirement for the automatic landing of aircraft and recoverable spacecraft according to ICAO, CAT 3 (vertical position accuracy of 0.6 meters (2 sigma)). In a first Kalman filter of the reference system on ground and of the system on board the pseudoranges, ionospheric effects and phase ambiguities are estimated. In a second Kalman filter the pseudorange compensation data and receiver clock errors are estimated on ground and the position, velocity, attitude, and heading and receiver clock errors are estimated on board. Experiments were performed based on GPS receivers SEL GLOBOS 2000 and a simulated INS. The results show that this system can meet the above mentioned requirements. Recommendations for the system improvement are included. ESA

ABOUT THE ACCURACY OF AN IMAGE-BASED NAVIGATION SYSTEM DURING THE RUNWAY APPROACH [ANALYSE DES FEHLERVERHALTENS EINER LUFTBILD-STUETZUNG IM LANDEANFLUG]
Hans-Ullrich Doehler Jan. 1993 35 p In GERMAN
(DLR-Mitt-93-01; ETN-93-94866) Avail: CASI HC A03/MF A01

Flight tests with trajectory measurements in the vicinity of an airport in a runway referenced coordinate system, such as flight inspection systems for testing landing aids in civil airports are considered. Position measurement procedures extracting the position information from images recorded on board the aircraft are studied. To estimate the accuracy of the achieved position data, a simulation of such a system is presented. Under the assumption of different kinds of error sources, regarded as system constraints, the overall position error was numerically determined. ESA

TERMINAL AREA FORECASTS, FY 1993-2005
Jul. 1993 583 p
(AD-A269855; FAA-APO-93-9) Avail: CASI HC A25/MF A06

This report contains forecasts of aviation activity of 873 airports in the United States for fiscal years 1993-2005. These include 401 airports with FAA air traffic control towers and radar approach control services and 27 FAA contract towers. For each airport, detailed forecasts are made for the four major users of the air traffic system: air carriers, air taxi/commuters, general aviation, and military. Summary tables contain national, FAA regional, and state aviation data and other airport specific-highlights. The forecasts have been prepared to meet the budget and planning needs of the FAA and to provide airport-specific information that can be used by state and local aviation authorities, the aviation industry, and the general public. VHF AIR/GROUND COMMUNICATIONS FOR AIR TRAFFIC CONTROL. VOLUME 1: A DECISION TREE APPROACH TO SYSTEM INNOVATIONS
Cheng-Hong Chen, James W. Howland, Robert I. Millar, Brian E. White, and Warren J. Wilson Jul. 1993 46 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DTFA01-93-C-0001)
(AD-A268485; MTR-M-93B0000096-Vol-1) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Improvements to VHF air/ground communications for civil aviation in the 118-137 MHz aeronautical mobile frequency band are systematically explored by means of a decision tree approach. Seven individual papers analyze in detail the operational and technical factors involved in making these improvements. Basic tradeoffs between analog and digital modulation are discussed to frame the problem. Near-term improvements utilizing various analog modulations with closer channel spacing are first reviewed. Then far-term improvements employing a wide range of digital modulation and coding techniques are considered. Multiplexing methods - frequency, time, and code division - are discussed in detail. Methods for random access to a shared communications channel are compared, with emphasis upon real-time operations for air traffic control. Volume I provides an executive summary of this work, while Volume II presents the technical details. DTIC

VMC LEFT TURN CURVED APPROACHES, TEST RESULTS Technical Note, Sep. 1989 - Jul. 1990
Rosanne M. Weiss Jul. 1993 45 p
(AD-A269476; DOT/FAA/CT-TN92/46) Avail: CASI HC A03/MF A01

Flight tests were conducted at the Federal Aviation Administration (FAA) Technical Center in 1989 and 1990 to aid in answering questions concerning curved approaches to a heliport under visual meteorological conditions (VMC). These questions include protected airspace within the curved segment of the approach, the most feasible angle of turn and minimum final approach segment. The FAA's Sikorsky S-76 and UH-1H were used for these tests. Data were collected from approaches using turn angles of 45-, 90-, and 180-degrees, each with three different final segments, 800, 1200, and 1600 feet (ft). Due to airspace restrictions at the time of these tests, left turns to final were flown. All maneuvers were tracked by ground-based tracking systems. This report documents the results of these flights. The test procedures, evaluation methodology, and technical and operational issues are described. Analysis of pilot performance as well as pilot subjective input are provided. Conclusions are presented that address the airspace, turn angle, and final segment issues. The results will be considered in future modifications of the FAA Heliport Design Advisory Circular, AC 150/5390-2. All appendixes can be found in Research Directorate for Aviation Technology Division Report DOT/FAA/CT-ACD33093/6. DTIC

N94-19300# Oak Ridge National Lab., TN.
ROBOT NAVIGATION IN UNKNOWN TERRAINS: INTRODUCTORY SURVEY OF NON-HEURISTIC ALGORITHMS
N. S. V. Rao, S. Kareti (Old Dominion Univ., Norfolk, VA.), Weimin Shi

(Old Dominion Univ., Norfolk, VA.), and S. S. Iyengar (Louisiana State Univ., Baton Rouge.) Jul. 1993 58 p
(Contract DE-AC05-84OR-21400)
(DE93-019221; ORNL/TM-12410) Avail: CASI HC A04/MF A01

A formal framework for navigating a robot in a geometric terrain through an unknown set of obstacles is considered. Here the terrain model is not known a priori, but the robot is equipped with a sensor system (vision or touch) employed for the purpose of navigation. The focus is restricted to the non-heuristic algorithms which can be theoretically shown to be correct within a given framework of models for the robot, terrain, and sensor system. These formulations, although abstract and simplified compared to real-life scenarios, provide foundations for practical systems by highlighting the underlying critical issues. First, the authors consider the algorithms that are shown to navigate correctly without much consideration given to the performance parameters, such as distance traversed. Second, they consider non-heuristic algorithms that guarantee bounds on the distance traversed or the ratio of the distance traversed to the shortest path length (computed if the terrain model is known). Then they consider the navigation of robots with very limited computational capabilities such as finite automata. DOE

ABSOLUTE POSITIONING BY COLLECTING GLOBAL POSITIONING SYSTEM (GPS) DATA ALONG SHORT BASELINES Final Report
Bruce R. Hermann and Alan G. Evans Sep. 1993 34 p
(AD-A271324; NSWCDD/TR-93/309) Avail: CASI HC A03/MF A01

This report addresses the problem of determining absolute positions (longitude and latitude) from Global Positioning System (GPS) data in the presence of Selective Availability (SA). The SA-epsilon effect can be avoided if one can wait until corrected or post-fitted satellite ephemerides and clock estimates become available. However, the SA-dither effect cannot easily be eliminated from the ranging data in the field. This report considers both problems and suggests methods that have the potential to allow absolute position solutions to be obtained even with dither corrupting the satellite data. The requirements and practicality of each are reviewed. DTIC

TAKE-OFF PERFORMANCE MONITORING SYSTEM ALGORITHM AND DISPLAY DEVELOPMENT
Sjack J. L. H. Verspay 15 Nov. 1991 13 p Presented at AIAA Atmospheric Flight Mechanics Conference, New Orleans, MA, 12-14 Aug. 1991 Sponsored by Netherlands Agency for Aerospace Programs, Delft Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(NLR-TP-91395-U; ETN-93-94783) Avail: CASI HC A03

As part of a study into the potential safety benefit of a Take Off Performance Monitoring (TOPM) system the development of the algorithms and displays needed for such a system are presented. The predictive algorithms make use of a first order correction polynome which is shown to be capable of predicting performance better than a zero order correction. Three displays for three different types of TOPM, which represent different levels of sophistication, are presented. ESA

N94-17826# Defence Research Agency, Bedford (England).
COMPARISON BETWEEN SWEPT AND DELTA CANARDS ON A MODEL OF A COMBAT AIRCRAFT
D. G. Mabey and C. R. Pyne Feb. 1993 36 p
(AD-A269561; DRA-TM-AP-23; DRIC-BR-318039) Avail: CASI HC A03/MF A01

The aerodynamic characteristics of a low speed half model of a typical combat aircraft configuration fitted with a 65 deg delta canard planform are compared with those for the same model fitted with 44.3 deg swept canard. Both canards had an RAE 104 aerofoil section. The tests were made in the DRA 13 ft x 9 ft Wind Tunnel on a large model of the DRA High Incidence Research Model (HIRM 1), modified to represent the Experimental Aircraft (EAP) configuration. For a 15% smaller planform area, the delta canard gives higher lift and comparable pitching moments for trimming. For canard and wing buffeting the differences are small. Overall, these low speed measurements suggest that delta canards with round leading edges have significant advantages over swept canards for future combat aircraft. DTIC

PRELIMINARY STRUCTURAL DESIGN: DEFINING THE DESIGN SPACE Final Report, Sep. 1989 - Dec. 1992
Stephen M. Batill and Richard A. Swift Feb. 1993 156 p
(Contract F33615-89-C-3208)
(AD-A268898; WL-TR-93-3004) Avail: CASI HC A08/MF A02

A series of studies were performed to evaluate the application of finite element-based analysis and optimization methods to the preliminary design of lightweight, aerospace structures. Either the internal structural arrangement or the structural materials were used as the design variables in each concept study. The concepts considered ranged from truss structures such as a helicopter tail-boom or complex space truss to a series of semi-monocoque lifting surfaces. Both static and dynamic constraints were used in the design of these concepts. Multidisciplinary optimization and analysis procedures were used to develop detailed information from finite element models for each structural concept. From this detailed design data, neural network representations of the design space were developed for the particular problem. The neural networks were then coupled with either simulated annealing or numerical search optimization techniques to identify improved design concepts. DTIC

N94-18315 Aeronautical Research Labs., Melbourne (Australia).
APPLICATION OF THE A* ALGORITHM TO AIRCRAFT TRAJECTORY GENERATION
M. E. Halpern Jul. 1993 27 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A268728; ARL-TR-20; DODA-AR-007-078) Avail: CASI HC A03

Work carried out on the development of concepts for an automated trajectory generator for military aircraft is described. The system uses the A* optimization algorithm to design a ground track which represents an optimal tradeoff between a short path and a path over low terrain. This is achieved by minimizing a cost function which is user selectable. This work incorporates path segments consisting of circular arcs, the design of an appropriate cost function and heuristics, as well as the inclusion of threats. Measures taken to improve the computational speed of the system are also described. Some examples of trajectories generated by the system are presented. DTIC

PROCEDURES AND DESIGN DATA FOR THE FORMULATION OF AIRCRAFT CONFIGURATIONS Final Report, Jan. 1992 - Jun. 1993

Thomas R. Sieron, Dudley Fields, A. W. Baldwin, and David W. Adamczak Aug. 1993 153 p

(AD-A270150; WL-TR-93-3068) Avail: CASI HC A08/MF A02

This report contains design data and rapid analysis methods to assist in establishing an initial aircraft configuration to begin the conceptual design process. It is based on an array of data acquired over many years for fighter, bomber, and transport aircraft. The data is compiled to estimate the gross take-off weight and physical size of a representative configuration for various range, payload, and speed requirements. Other data and procedures are included to define the general dimensions of the fuselage, wing, vertical, and horizontal stabilizers. Aerodynamic methods and data are provided to rapidly estimate the drag and lift characteristics at subsonic, transonic, and supersonic speeds for this class of aircraft. Performance data has been assembled to show the impact of range, payload, speed, maneuverability, take-off and landing requirements on the physical and geometric characteristics of these configurations. A sample problem is presented to illustrate the use of this design data in formulating an aircraft configuration. DTIC

VERTICAL DROP TEST OF A METRO 3 AIRCRAFT Final Report, Apr. 1991 - Apr. 1992

Robert J. McGuire, William J. Nissley, and James E. Newcomb Jun. 1993 80 p

(AD-A270032; DOT/FAA/CT-93/1) Avail: CASI HC A05/MF A01

A commuter category Fairchild Metro 3 fuselage and wingbox assembly was subjected to a vertical impact test at the Federal Aviation Administration (FAA) Technical Center, Atlantic City International Airport, NJ. The purpose of the test was to measure the structural response of the fuselage, floor, cabin furnishings (including standard and modified seats), and anthropomorphic dummies. The test was conducted to simulate the potentially survivable impact conditions of an actual crash. The airframe was dropped from 11.2 feet and impacted at a velocity of 26.32 feet per second (ft/sec). The test weight simulated an airplane configuration that was approximately 1,450 pounds less than the maximum zero fuel weight (13,100 pounds) of the airplane with a 14,100-pound maximum takeoff weight. Acceleration, load, and deflection data were collected throughout the test. Instrumentation were located on the fuselage, floor, seats, and within the 'crash test dummies.' The vertical impact test resulted in peak accelerations of gravity (g) ranging from 40g to 60g throughout the airframe. DTIC

FLIGHT TEST TECHNIQUES FOR AIRCRAFT PARAMETER ESTIMATION IN GROUND EFFECT M.S. Thesis

James M. Clark 1993 146 p

(AD-A270058; AFIT/CI/CIA-93-145) Avail: CASI HC A07/MF A02

The effect of ground proximity on the performance and handling of an aircraft has received extensive study, particularly in the wind tunnel. Previous research, however, provides few consistent quantitative conclusions regarding ground effect, and flight test methods for directly measuring ground effect are needed. This effort identifies flight test maneuvers suitable for measuring aircraft stability and control parameters in ground effect, using simulated response data and pEst, a parameter estimation program developed at NASA-Dryden. This study also considers the effects of instrument precision, system sampling rate, instrument bias, and response noise. Five simple longitudinal and eleven lateral-directional maneuvers that allow accurate parameter estimation, keep the aircraft in ground effect, and do not result in responses that are unsafe in ground proximity are identified. The longitudinal maneuvers provide accurate lift and moment parameters, and the lateral-directional analysis estimates all fifteen lateral-directional derivatives of interest within ten percent of their simulated values. X-29: RESEARCH AIRCRAFT (Videotape)

Jan. 1991 Videotape: 2 min. 35 sec. playing time, in color, with sound

(NASA-TM-109370; NONP-VT-94-198217) Avail: CASI VHS A01/BETA A22

A preliminary look at the Ames Dryden Flight Research Center in the context of the X-29 aircraft is provided. The uses of the X-29's 30 deg forward swept wing are examined. The video highlights the historical development of the forward swept wing, and its unique blend of speed, agility, and slow flight potential. The central optimization of the wing, the forward canard, and the rear flaps by an onboard flight computer is also described. CASI

AN INVESTIGATION OF FIGHTER AIRCRAFT AGILITY Final Technical Report, 1 Jan. 1989 - 31 Dec. 1993

John Valasek and David R. Downing 5 Nov. 1993 263 p

(Contract NCC2-588)

(NASA-CR-194608; NAS 1.26:194608; KU-FRL-831-7) Avail: CASI HC A12/MF A03

This report attempts to unify in a single document the results of a series of studies on fighter aircraft agility funded by the NASA Ames Research Center, Dryden Flight Research Facility and conducted at the University of Kansas Flight Research Laboratory during the period January 1989 through December 1993. New metrics proposed by pilots and the research community to assess fighter aircraft agility are collected and analyzed. The report develops a framework for understanding the context into which the various proposed fighter agility metrics fit in terms of application and testing. Since new metrics continue to be proposed, this report does not claim to contain every proposed fighter agility metric. Flight test procedures, test constraints, and related criteria are developed. Instrumentation required to quantify agility via flight test is considered, as is the sensitivity of the candidate metrics to deviations from nominal pilot command inputs, which is studied in detail. Instead of supplying specific, detailed conclusions about the relevance or utility of one candidate metric versus another, the authors have attempted to provide sufficient data and analyses for readers to formulate their own conclusions. Readers are therefore ultimately responsible for judging exactly which metrics are 'best' for their particular needs. Additionally, it is not the intent of the authors to suggest combat tactics or other actual operational uses of the results and data in this report. This has been left up to the user community. Twenty of the candidate agility metrics were selected for evaluation with high fidelity, nonlinear, non real-time flight simulation computer programs of the F-5A Freedom Fighter, F-16A Fighting Falcon, F-18A Hornet, and X-29A. The information and data presented on the 20 candidate metrics which were evaluated will assist interested readers in conducting their own extensive investigations. The report provides a definition and analysis of each metric; details of how to test and measure the metric, including any special data reduction requirements; typical values for the metric obtained using one or more aircraft types; and a sensitivity analysis if applicable. The report is organized as follows. The first chapter in the report presents a historical review of air combat trends which demonstrate the need for agility metrics in assessing the combat performance of fighter aircraft in a modern, all-aspect missile environment. The second chapter presents a framework for classifying each candidate metric according to time scale (transient, functional, instantaneous), further subdivided by axis (pitch, lateral, axial). The report is then broadly divided into two parts, with the transient agility metrics (pitch lateral, axial) covered in chapters three, four, and five, and the functional agility metrics covered in chapter six. Conclusions, recommendations, and an extensive reference list and biography are also included. Five appendices contain a comprehensive list of the definitions of all the candidate metrics; a description of the aircraft models and flight simulation programs used for testing the metrics; several relations and concepts which are fundamental to the study of lateral agility; an in-depth analysis of the axial agility metrics; and a derivation of the relations for the instantaneous agility and their approximations. The features of fiber composite materials employed in military aircraft design are reviewed. Fiber reinforced plastics are made with duromer matrices, such as polyester, epoxy, bismaleimide, and polyimide, or thermoplastic matrices, such as polyether ether ketone, polypropylene sulfide, and polyether imide. Carbon fibers were differentiated as high strain, intermediate modulus, and high modulus fibers. Mechanical properties of prepregs and laminates are described. The way in which fiber reinforced composites are fitted to aircraft structure weight minimization is ascertained. The use of the NASTRAN (NASA Structural Analysis) program to calculate aircraft structures with the finite element method is depicted. The importance of multidisciplinary optimization (flight controls, aerodynamics, and flight mechanics) in aircraft design is outlined. Manufacturing processes for composites production, such as tape steering, hot forming, net molding, and co-curing are reviewed. Methods for nondestructive inspection of aircraft materials, such as ultrasonic evaluation, holography, and thermography, are depicted. Carbon fiber composites are concluded to be particularly interesting for aircraft development because of their properties of mechanical strength, repairability, and maintainability. ESA

A vortex flow model, based on a computer aided design surface model of a body with a curve and surface representation, is developed. After establishing the topology (location and order of blocks in space), each block was described with six simple three dimensional areas and the corresponding block edges. Geometrical data were fed in VDA-FS (German acronym for Union of Automobile Industry - interface) format by the Dogrid surface net generator. All blocks were connected into a calculation domain in order to perform Euler calculations for delta wing configurations with and without canard. Euler equations in a conservative form were solved with a finite volume scheme; a biased upwind difference scheme of Godunov type was used for the fluxes in the cell boundaries and the Newton method supplied a time implicit solution. The front edge vortex on the main wing was accurately obtained and the predicted interferences of both vortex systems of canard and main wing could be attested. ESA

BLADE AND HUB LOADS OF BALLISTICALLY DAMAGED HELICOPTER ROTORS Final Report, Apr. 1992 - May 1993

Ki C. Kim Oct. 1993 44 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(AD-A270663; ARL-TR-235) Avail: CASI HC A03

The effects of (simulated) ballistic damage on helicopter rotor blade response and rotor hub loads are investigated. A finite element formulation based on Hamilton's principle is used for structural analysis, and aerodynamic loads are calculated using quasisteady aerodynamic theory. Each blade is as being composed of elastic beams undergoing flap bending, lag bending, elastic twist, and axial deflections. Dynamic responses of multi-blade rotor systems are calculated from nonlinear periodic normal mode equations using a finite element in time scheme. Results are calculated for the SA349/2 Gazelle helicopter for both undamaged and damaged blade configurations. Blade damage effects are determined in terms of blade mode shapes and frequencies, aeroelastic response, and rotor hub loads. Blade dissimilarity due to ballistic damage can induce a luge 1/rev vibratory component on the rotor hub. DTIC

NOISE MEASUREMENTS ON TWO TYPES OF AIRPLANES USED FOR SPRAYING IN AGRICULTURE [GELUIDSMETINGEN AAN TWEE TYPEN LANDBOUW-SPROEIVLIEGTUIGEN]

D. M. VanPaassen and G. J. J. Ruijgrok Dec. 1992 19 p In DUTCH (LR-706; ETN-93-94423) Avail: CASI HC A03/MF A01

The flyover noise of two types of propeller driven, single engined airplanes, used for agricultural purposes, was measured. The flyovers were conducted at two different altitudes over the microphone position. The flight runs were further divided into two flight profiles. The first profile required the aircraft to perform a standard climb-out after takeoff using the power setting and air speed for maximum climb rate. The second profile contained the execution of level flights at constant (normal) cruising speed and cruising power. The different noise levels are listed. ESA

PRELIMINARY DESIGN OF A WATER COOLED AVIONICS COOLING RACK M.S. Thesis
Colleen L. Ellis 25 Mar. 1993 47 p
(AD-A268826) Avail: CASI HC A03/MF A01

Military electronics are frequently operated in excessively confined spaces aboard ships and aircraft. This limited space impacts significantly on the space available for cooling equipment. The optimal solution is the development of one universal, modular rack for shipboard and aviation use. With a modular design, upgrades to equipment could also be accompanied by an upgrade to the cooling rack itself with very little additional cost or difficulty. A water cooled avionics rack can provide sufficient cooling for any piece or combination of avionics equipment if enough water flow paths are used, the water is at the appropriate temperature, and the water is properly distributed within the passages. To determine if the cooling medium, water, is properly distributed within a modular cooling rack, an analysis of the flow and pressure distribution of the coolant is required. This thesis presents a computer code that has been developed as an initial step in the total design of a modular cooling rack for avionics equipment. In itself, the code details a specific design technique and allows for the determination of whether a proposed configuration, including source location, characteristics of the cooling water, and the size and shape of the proposed flow passages will indeed provide a proper distribution of the coolant. NUMERICAL SIMULATION OF FLUID DYNAMICS AND COMBUSTION FOR RAM ACCELERATOR PROJECTILE/OBTURATOR INTERACTION Final Report, Jan. - Dec. 1992
Michael J. Nusca Sep. 1993 44 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A269715; ARL-TR-198) Avail: CASI HC A03

Computational fluid dynamics solutions of the Navier-Stokes equations have been applied to both nonreacting and reacting in-bore flowfields for a ram accelerator projectile launch system. In this system, a projectile is injected at supersonic velocity into a stationary tube filled with a pressurized mixture of hydrocarbon, oxidizer, and inert gases. After ignition, the shock system generated by the projectile can result in sustained combustion around and aft of the projectile. This energy release process, which travels with the projectile, also generates high pressures and imparts thrust to the projectile. Experimental observations indicate that the porous obturator may play a significant role in the initiation of combustion after projectile injection. Numerical simulations have been used to investigate the role of the obturator in both the 38mm and 120mm (bore diameter) systems. DTIC

VANE OPTIMIZATION FOR MAXIMUM EFFICIENCY USING DESIGN OF EXPERIMENTS (DOX) Final Report, Apr. 1992 - Mar. 1993
Paul T. Kerney Mar. 1993 47 p Limited Reproducibility: More than

20% of this document may be affected by microfiche quality
(AF Proj. 681B)
(AD-A270270; WL-TR-93-2055) Avail: CASI HC A03

Optimization of vane and bleed settings in a multistage axial compressor undergoing development can be a difficult, time-consuming, and expensive process. This project optimized seven variable vanes and one variable bleed on the five-stage Pratt & Whitney XTC66 compressor at the aerodynamic design point (ADP) for maximum efficiency using Design of Experiments (DOX). The DOX are statistical methods for changing process inputs in a systematic way, and analyzing the resulting outputs in order to improve a response to an acceptable or optimum value, find a less expensive design, material, or method providing equivalent results, or understand process sensitivities. Along with developing a model for maximum efficiency, the project also developed models for predicting pressure ratio and mass flow. Results show the number of Steady State Data Points (SSDP's) to be reduced, as well as, the total test time without sacrificing data integrity.

AN APPLICATION OF PARAMETER ESTIMATION TO THE STABILITY AND CONTROL OF THE BQM-147 UNMANNED AERIAL VEHICLE M.S. Thesis
Patrick J. Quinn Jun. 1993 132 p
(AD-A268741) Avail: CASI HC A07/MF A02

Parameter estimation methods were used to obtain estimates of stability and control derivatives for the Marine Corps BQM-147 Unmanned Air Vehicle. The results from a simple, PC-based linear model and those from a more robust nonlinear model, pEst, were compared. A Cramer-Rao bound was used to assess the accuracy of the estimates for both methods. The bounds were high for both the longitudinal case and the lateral-directional case due to the limited maneuvers tested, high levels of noise in the same general frequency range as the control input, and the lack of body-angle data. The linear model failed to provide estimates for the lateral-directional case. Though the results may be used as starting points for a dynamic model of the aircraft, it is recommended that the flight test procedures be modified to address the issues raised concerning noise, recorded signals, and the need for repeated maneuvers.

CLOSE-COUPLED OSCILLATING CANARD EFFECTS ON POST-STALL LIFT ENHANCEMENT M.S. Thesis
Douglas G. McBane Jun. 1993 97 p
(AD-A268938) Avail: CASI HC A05/MF A02

The effects of an oscillating close-coupled canard on the canard/wing vortex interaction for increased lift enhancement were studied. Two test conditions were studied: the first with a model angle of attack of 22 deg and the second of 34 deg. The canard was positioned at three mean deflection angles equal to 4, 7, and 10 deg for the model angle of attack of 22 deg and -4, -7, and -10 deg for the model angle of attack of 34 deg. At each of the canard mean deflection angles, the canard was oscillated with amplitudes of +/- 5 deg and +/- 10 deg with reduced frequencies ranging from 0.046 to 0.232. Because of the small effects noted which were of the order of accuracy of the balance, only general trends are discussed. The trends indicate that for this particular model configuration and geometry, lift was decreased slightly with increasing canard frequency and amplitude. No lift-enhancement benefits were revealed during the study.

The capabilities of the Interaction of Structures, Aerodynamics, and Controls (ISAC) system of program modules is discussed. The major modeling, analysis, and data management components of ISAC are identified. Equations of motion are displayed for a Laplace-domain representation of the unsteady aerodynamic forces. Options for approximating a frequency-domain representation of unsteady aerodynamic forces with rational functions of the Laplace variable are shown. Linear time invariant state-space equations of motion that result are discussed. Model generation and analyses of stability and dynamic response characteristics are shown for an aeroelastic vehicle which illustrates some of the capabilities of ISAC as a modeling and analysis tool for aeroelastic applications.

THE DYNAMIC STABILITY OF THE HELICOPTER
H. Wittenberg Apr. 1993 116 p
(LR-772; ISBN-9-06-275887-8; ETN-93-95031) Copyright Avail: CASI HC A06/MF A02

The longitudinal and lateral dynamic stability of conventional helicopters with one main rotor and tail rotor are analyzed. The analysis is similar as for fixed wing aircraft and based on linearized equations of motion. For the hovering flight the stability derivatives are derived for rotors with central unconstrained and constraint flapping hinges. The latter type simulates rotors with flapping hinge off set or hingeless rotors. The helicopter has a longitudinal and lateral unstable oscillatory mode in hovering flight. It is found that for highly constrained flapping hinges the lateral oscillatory mode can be slightly damped. The qualitative analysis of the dynamic stability in forward flight based on the root locus method of Evans is presented. It is shown that for helicopters with horizontal tail the longitudinal characteristics at moderate and high speeds are the same as for fixed wing aircraft. The short period motion and phugoid motion are damped and the helicopter is dynamically stable. The same observation applies to the lateral dynamic stability. The roll and Dutch roll modes are damped, but the spiral mode can be damped or undamped, depending on the contribution of the tailrotor in the stability derivatives.

A LEARNING AUTOPILOT FOR AUTOMATICALLY CONTROLLED ROBUST REGULATION Ph.D. Thesis [EIN LERNENDER AUTOPILOT MIT SELBSTEINSTELLENDER ROBUSTER REGELUNG]
Kai Schulz 1992 140 p In GERMAN Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ETN-93-95075) Avail: CASI HC A07

The motion control of vehicles in three dimensional space is investigated. Particular consideration is given to the improvement of trajectory accuracy, taking into account model uncertainties. The physical model parameters were estimated with an offline identification process. A two step procedure, based on the equation error and least squares methods, was chosen for the following reasons: it is unsensitive to noncorrelated perturbations; it is independent of convergence behavior; and it produces parameters for continuous models, in combination with state variable filters. The structure of the controller was realized with the H(infinity) norm in order to suppress the dependence on boundary conditions such as limit frequencies of actuators and sensors. A forward control concept is proposed which allows the strong interactions between the motion degrees of freedom to be compensated. Simulation results of ship steering are presented for validation of the autopilot system. ESA

TRANSPORT POLICY OPTIONS FOR REDUCING NOISE AT AIRPORTS; HAMBURG AIRPORT TAKEN AS AN EXAMPLE [VERKEHRSPOLITISCHE OPTIONEN ZUR LAERMREDUKTION AN FLUGHAEFEN DARGESTELLT AM BEISPIEL DES FLUGHAFENS HAMBURG]
Stefan Beyhoff, Hansjochen Ehmer, Horst Focke, and Volker Warlitzer Dec. 1992 279 p In GERMAN
(DLR-FB-92-40; ETN-93-94872) Avail CASI HC A13/MF A03

The air transport demand of scheduled and charter traffic in the northern part of Germany is studied. Based on a detailed analysis of passenger transport demand by size and structure and the assignment to the airports Hamburg and Hannover a forecast of the demand by region and of passenger emplanement and aircraft movements by airport for the year 2000 was made. Measures of transport policy for reducing noise emissions at Hamburg airport are presented. Detailed descriptions of the measures like noise contingents, differentiation of fees, restrictions or bans of certain aircraft or segments of demand, cooperation between airports, and influencing the model split between air and rail transport are given. It is concluded that in the long run larger conforming measures like noise contingents are more efficient as compared with administrative measures. ESA

A WIND TUNNEL MODEL CONTROL SURFACE ACTUATOR INTERFACE
S. A. Kent Jun. 1993 45 p
(AD-A268729; ARL-TN-13; DODA-AR-006-658) Avail: CASI HC A03/MF A01

A microprocessor controlled system is described for the remote positioning of flight control surfaces on a wind tunnel aircraft model. The system utilizes DC micromotors and Linear Variable Displacement Transducers (LVDTs) for driving force and accurate position feedback. The Actuator Module was developed primarily for use with a 1/9th scale F/A-18 model to collect data for the International Follow On Structural Test Program (IFOSTP). DTIC

INTERFEROMETER STATIONS AT THE AIR FORCE AEROBALLISTIC RESEARCH FACILITY Final Report, Aug. 1988 - Dec. 1990
R. C. Anderson and J. E. Milton Jul. 1993 41 p
(Contract F08635-88-C-0160)
(AD-A268776; WL-TR-92-7035) Avail: CASI HC A03/MF A01

Two interferometer stations were installed in the Eglin AFB ballistic range--a holographic and a common path interferometer. The latter was used in both dark central ground and field absorption modes. A theoretical development given for the common path instrument predicts an improved type of phase contrast interferometer with a half wave shifting filter instead of the quarter wave used in the past. Experimentally measured interferograms were found to be in good agreement with synthetic interferograms calculated with data from a Navier-Stokes Computational Fluid Dynamics (CFD) code. DTIC

FOIL SUPPORT STRUCTURE FOR LARGE ELECTRON GUNS
J. P. Brucker and E. A. Rose 1993 5 p Presented at the 9th IEEE Pulsed Power Conference, Albuquerque, NM, 21-23 Jun. 1993
(Contract W-7405-eng-36)
(DE93-018478; LA-UR-93-2623; CONF-930616-18) Avail: CASI HC A01/MF A01

This paper describes a novel support structure for a vacuum diode used to pump a gaseous laser with an electron beam. Conventional support structures are designed to hold a foil flat and rigid. This new structure takes advantage of the significantly greater strength of metals in pure tension, utilizing curved shapes for both foil and support structure. The shape of the foil is comparable to the skin of a balloon, and the shape of the support structures is comparable to the cables of a suspension bridge. This design allows a significant reduction in foil thickness and support structure mass resulting in a lower electron-beam loss between diode and laser gas. In addition, the foil is pre-formed in the support structure at pressures higher than operating pressure. Therefore, the foil is operated far from the yield point. Increased reliability is anticipated. DOE

(PB93-197838; SP-RAPP-1993:05) Avail: CASI HC A04/MF A01

To be able to calculate the wavelength of the light used in laser interferometer measurements the temperature and the pressure must be known. Therefore the laser interferometers are equipped with temperature and pressure sensors. To be able to calibrate these sensors a chamber with adjustable temperature in the interval 15-25 C and adjustable pressure in the interval 920-1050 mbar has been constructed and evaluated. The temperature of the chamber is regulated by means of an electrical PD-regulator, where the desired temperature is set manually. The air pressure of the chamber is regulated with manual valves and a vacuum pump with one blow and one suck side. The temperature in the environmental chamber is measured with Pt-100 sensors, which are connected to a temperature instrument and the absolute air pressure is measured with a digital barometer. NTIS

SURVEY ON THE APPLICATION OF A 3D GENERAL PURPOSE WIND-TUNNEL RESEARCH MODEL
M. J. Pagen Mar. 1993 49 p
(LR-713; ETN-93-95024) Avail: CASI HC A03/MF A01

A general purpose wind tunnel research model, which is the major element of a proposed aerodynamic design research program, is described. As a first stage in the design of the model a study was conducted to determine the aspects of interest of aircraft configuration research. This has brought out that attention in configuration aerodynamics is directed to the aerodynamic integration of highly loaded propellers, and the performance evaluation of multi wings. The model is designed in assembly kit form so that various configurations can be composed, including two and three surface arrangements of which the lifting surfaces can have different settings. The propulsion system can be mounted in various fashions. Systematic component buildup tests were performed starting from a baseline fuselage to identify aerodynamic contributions of individual airframe components, and aerodynamic interference effects. The same configurations were used to establish the effects of propeller slipstream on the flow field around the model. ESA

Avail: CASI HC A02/MF A03

The recognition and understanding of cardiovascular adaptation to spaceflight has experienced substantial advancement in the last several years. In-flight echocardiographic measurements of astronaut cardiac function on the Space Shuttle have documented a 15 percent reduction in both left ventricular volume index and stroke volume with a compensatory increase in heart rate to maintain cardiac output. To date, the reduced cardiac size and stroke volume have been presumed to be the consequence of the reduction in circulating fluid volume following diuresis and other physiological processes to reduce blood volume within a few days after orbital insertion. However, no specific mechanism for the reduced stroke volume has been elucidated. The following investigation proposes the use of a hydraulic model of the cardiovascular system to examine the possibility that the observed reduction in stroke volume may, in part, be related to fluid physics effects on heart function. The automated model is being prepared to fly as a GAS payload. The experimental apparatus consists of a pneumatically actuated, elliptical artificial ventricle connected to a closed-loop, hydraulic circuit with compliance and resistance elements to create physiologic pressure and flow conditions. The ventricle is instrumented with high-fidelity, acceleration-insensitive, catheter-tip pressure transducers (Millar Instruments) in the apex and base to determine the instantaneous ventricular pressures and (delta)P(sub LV) across the left ventricle (LVP(sub apex)-LVP(sub base). The ventricle is also instrumented with a flow probe and pressure transducers immediately upstream of the inflow valve and downstream of the outflow valve. The experiment will be microprocessor controlled with analog signals stored on the FM data tape recorder. By varying the circulating fluid volume, ventricular function can be determined for varying preload pressures with fixed afterload pressure. Pilot experiments on board the NASA KC-135 aircraft have demonstrated proof-of-concept and provided early support for the proposed hypothesis. A review of the pilot experiments and developmental progress on the GAS version of this experiment will be presented. Author

CALIFORNIA STUDENT GET AWAY SPECIAL PAYLOAD GAS-450
Glen Ray, Edmund Burke, and Marty Waldman *In* NASA. Goddard Space Flight Center, The 1993 Shuttle Small Payloads Symposium Oct. 1993 p 11-23 (For primary document see N94-19162 04-12)
Avail: CASI HC A03/MF A03

The California Student Get Away Special Payload GAS-450, recently went into orbit on the STS-57 Mission, Space Shuttle, Endeavour, 21 June 1993, 6:14 AM and landed on the 29 June 1993 at Kennedy Space Center (KSC). Fifty students from 13 California Central Coast Schools and one in San Francisco designed and built 13 active experiments (6 modules) for this mission. Preliminary analysis of our completely reusable payload bus system indicated that the structure, power system, microprocessor, and sensor systems in each experiment module worked flawlessly. The experiments themselves performed exceptionally well with a 60 percent success ratio. The students are thoroughly documenting their own experiments and results via a standard research paper guideline generated by the GAS-450 technical staff. Lessons learned (program management and technical) are documented at the end of the paper. If any other organization needs payload/experiment development or NASA documentation assistance, then please contact us. We can help make your idea a space tested reality. Three years of intense effort culminated on 3 February 1993, the GSFC field operations team at Kennedy Space Center performed the final pressure decay and electrical tests upon the fully integrated GAS-450 flight canister. Subsequently, the payload was integrated with its parent GAS Bridge Assembly in mid-February and the bridge was transferred to the KSC orbiter team in late February 1993. The STS-57 mission originally scheduled to launch on the 29 April 1993 slipped until 21 June 1993. Our Payload shared the cargo bay with ten other GAS Canisters, the EUREKA experiment, the SHOOT experiment, and the SPACEHAB-1 module. The SIL technical staff retrieved the GAS-450 payload after flight from the NASA Spin Test Facility at KSC and shipped it back to California on the 22 July 1993 for student analysis at Allan Hancock College this summer. NEW ROOM TEMPERATURE HIGH RESOLUTION SOLID-STATE DETECTOR (CdZnTe) FOR HARD X RAYS AND GAMMA RAYS **c72**
AmyElizabeth C. Stewart (Maryland Univ., College Park.) and Upendra D. Desai *In its* The 1993 Shuttle Small Payloads Symposium Oct. 1993 p 25-31 (For primary document see N94-19162 04-12)
Avail: CASI HC A02/MF A03

The new CdZnTe high 'Z' material represents a significant improvement in detectors for high energy photons. With the thicknesses available, photons up to 100 keV can be efficiently detected. This material has a wide band gap of 1.5 - 2.2 eV which allows it to operate at room temperature while providing high spectral resolution. Results of resolution evaluations are presented. This detector can be used for high resolution spectral measurements of photons in x-ray and gamma-ray astronomy, offering a significant reduction in the weight, power, and volume of the detector system compared to more conventional detector types such as scintillation counters. In addition, the detector will have the simplicity and reliability of solid-state construction. The CdZnTe detector, as a new development, has not yet been evaluated in space. The Get Away Special program can provide this opportunity. Author (revised)

TELESCOPE FOR X RAY AND GAMMA RAY STUDIES IN ASTROPHYSICS **c89**
W. D. Weaver (Arkansas State Univ., State University.) and Upendra D. Desai *In its* The 1993 Shuttle Small Payloads Symposium Oct. 1993 p 33-36 (For primary document see N94-19162 04-12)
Avail: CASI HC A01/MF A03

Imaging of x-rays has been achieved by various methods in astrophysics, nuclear physics, medicine, and material science. A new method for imaging x-ray and gamma-ray sources avoids the limitations of previously used imaging devices. Images are formed in optical wavelengths by using mirrors or lenses to reflect and refract the incoming photons. High energy x-ray and gamma-ray photons cannot be reflected except at grazing angles and pass through lenses without being refracted. Therefore, different methods must be used to image x-ray and gamma-ray sources. Techniques using total absorption, or shadow casting, can provide images in x-rays and gamma-rays. This new method uses a coder made of a pair of Fresnel zone plates and a detector consisting of a matrix of CsI scintillators and photodiodes. The Fresnel zone plates produce Moire patterns when illuminated by an off-axis source. These Moire patterns are deconvolved using a stepped sine wave fitting or an inverse Fourier transform. This type of coder provides the capability of an instantaneous image with sub-arcminute resolution while using a detector with only a coarse position-sensitivity. A matrix of the CsI/photodiode detector elements provides the necessary coarse position-sensitivity. The CsI/photodiode detector also allows good energy resolution. This imaging system provides advantages over previously used imaging devices in both performance and efficiency. Author (revised)

STATIC COMPUTER MEMORY INTEGRITY TESTING (SCMIT): AN EXPERIMENT FLOWN ON STS-40 AS PART OF GAS PAYLOAD G-616 **c60**
Thomas Hancock *In* NASA. Goddard Space Flight Center, The 1993 Shuttle Small Payloads Symposium Oct. 1993 p 57-62 (For primary document see N94-19162 04-12)
Avail: CASI HC A02/MF A03

This experiment investigated the integrity of static computer memory (floppy disk media) when exposed to the environment of low earth orbit. The experiment attempted to record soft-event upsets (bit-flips) in static computer memory. Typical conditions that exist in low earth orbit that may cause soft-event upsets include: cosmic rays, low level background radiation, charged fields, static charges, and the earth's magnetic field. Over the years several spacecraft have been affected by soft-event upsets (bit-flips), and these events have caused a loss of data or affected spacecraft guidance and control. This paper describes a commercial spin-off that is being developed from the experiment. Author

Avail: CASI HC A01/MF A03

Evolving Technologies Corporation is designing a new type of computer called a Vicinity Processor Unit (VPU). The VPU is designed to monitor and control payloads using an operating system, control process and software environment that specifically takes into account the time delay associated with remotely controlling and monitoring a group of payloads in real time. This is a fundamentally different way of computing which has vast scientific implications for the design and implementation of data processing systems for future space flight missions. As a demonstration mission, the VPU is expected to be flown aboard the Space Shuttle (Payload Identification No. G-700) as a part of NASA's Small Self-Contained Payloads (SSCP) Program. We believe this mission can greatly facilitate the development and validation of technology which may prove to be mission critical for many future space flight missions. Author (revised)

(Grant NAGw-1195)
Avail: CASI HC A02/MF A03

A program is underway to develop a YAG laser based materials processing workstation to fly in the cargo bay of the Space Shuttle. This workstation, called Space Applications Industrial Laser System (SAILS), will be capable of cutting and welding steel, aluminum, and Inconel alloys of the type planned for use in constructing the Space Station Freedom. As well as demonstrating the ability of a YAG laser to perform remote (fiber-optic delivered) repair and fabrication operations in space, fundamental data will be collected on these interactions for comparison with terrestrial data and models. The flight system, scheduled to fly in 1996, will be constructed as three modules using standard Get-Away-Special (GAS) canisters. The first module holds the laser head and cooling system, while the second contains a high peak power electrical supply. The third module houses the materials processing workstation and the command and data acquisition subsystems. The laser head and workstation cansisters are linked by a fiber-optic cable to transmit the laser light. The team assembled to carry out this project includes Lumonics Industrial Products (laser), Tennessee Technological University (structural analysis and fabrication), Auburn University Center for Space Power (electrical engineering), University of Waterloo (low-g laser process consulting), and CSTAR/UTSI (data acquisition, control, software, integration, experiment design). This report describes the SAILS program and highlights recent activities undertaken at CSTAR. Author

The High Resolution Shuttle Glow Spectrograph-B (HRSGS-B) is a small payload being developed by the Naval Research Laboratory. It is intended for study of shuttle surface glow in the 180-400 nm near- and middle-ultraviolet wavelength range, with a spectral resolution of 0.2 nm. It will search for, among other possible features, the band systems of excited NO which result from surface-catalyzed combination of N and O. It may also detect O2 Hertzberg bands and N2 Vegard-Kaplan bands resulting from surface recombination. This wavelength range also includes possible N2+ and OH emissions. The HRSGS-B will be housed in a Get Away Special canister, mounted in the shuttle orbiter payload bay, and will observe the glow on the tail of the orbiter. Author

LIMITED DURATION OF CANDIDATE MATERIALS EXPOSURE EXPERIMENT (LDCE): A COMPLEX AUTONOMOUS PAYLOAD (CAP) USING A GET AWAY SPECIAL (GAS) CANISTER c25
D. Davis *In* NASA. Goddard Space Flight Center, The 1993 Shuttle Small Payloads Symposium Oct. 1993 p 115-124 (For primary document see N94-19162 04-12)
Avail: CASI HC A02/MF A03

CMSS has designed, fabricated, qualified and flown the LDCE payload as a cost effective space flight hardware to conduct exposure of materials to the space environment. The hardware has been qualified for 10 missions, utilizing a GAS Canister, supplied by Goddard Space Flight Center. Results of the first series of LDCE experiments have shown that the hardware performed as expected. Author

KENNEDY SPACE CENTER PROCESSING OF SHUTTLE SMALL PAYLOADS
Michael E. Haddad *In* NASA. Goddard Space Flight Center, The 1993 Shuttle Small Payloads Symposium Oct. 1993 p 125-144 (For primary document see N94-19162 04-12)
Avail: CASI HC A03/MF A03

There are many steps involved in preparing a payload for a mission into space on the Space Shuttle. Operations at the John F. Kennedy Space Center (KSC) are the last of those steps for the hardware before the payload is launched. To assure a successful and efficient KSC processing flow, a great deal of planning between the Robert H. Goddard Space Flight Center (GSFC) and KSC personnel is required before the payload arrives at KSC. After arrival, pre-flight operations occur between payload personnel, GSFC personnel, and KSC personnel for integration of the payload into its carrier (if required), in preparation for installation into a Orbiter. Once installed into an Orbiter, final test(s), checkout, and close-out of the payload is performed by GSFC and KSC personnel before launch. Mission support varies depending on the payload flying, but once the mission is complete and the Orbiter has returned to KSC, post-flight operations begin. This usually involves a reverse flow of the pre-flight operations. KSC operations conclude when the payload, its ground support equipment (GSE), and personnel depart KSC. A list of lessons learned is generated at the end of each payload flow, to avoid repeating the same mistakes (if any) for the next payload or for multiple repeat flights of the same payload. Always monitored are planned changes that may affect the payloads, GSE, KSC facilities, payload personnel, GSFC personnel, and/or KSC personnel. Author

UVSTAR: AN IMAGING SPECTROGRAPH WITH TELESCOPE FOR THE SHUTTLE HITCHHIKER-M PLATFORM c89
Roberto Stalio, Bill R. Sandel (Arizona Univ., Tucson.), and A. Lyle Broadfoot (Arizona Univ., Tucson.) *In* NASA. Goddard Space Flight Center, The 1993 Shuttle Small Payloads Symposium Oct. 1993 p 145-152 (For primary document see N94-19162 04-12)
Avail: CASI HC A02/MF A03

UVSTAR is an EUV spectral imager intended as a facility instrument devoted to solar system and astronomy studies. It covers the wavelength range of 500 to 1250 A, with sufficient spectral resolution to separate emission lines and to form spectrally resolved images of extended plasma sources. Targets include the Io plasma torus at Jupiter, hot stars, planetary nebulae and bright galaxies. UVSTAR consists of a pair of telescopes and concave grating spectrographs that cover the overlapping spectral ranges of 500-900 and 850-1250 A. The telescopes use two 30 cm diameter off-axis paraboloids having focal length of 1.5 m. An image of the target is formed at the entrance slits of the two concave grating spectrographs. The gratings provide dispersion and re-image the slits at the detectors, intensified CCD's. The readout format of the detectors can be chosen by computer, and three slit widths are selectable to adapt the instrument to specific tasks. UVSTAR has internal gimbals which allow rotation of plus or minus 3 deg about each of two axes. Dedicated finding and tracking telescopes will acquire and track the target after rough pointing is achieved by orienting the Orbiter. Responsibilities for implementation and utilization of UVSTAR are shared by groups in Italy and the U.S. UVSTAR is scheduled for flight in early 1995, timed for an opportunity to observe the Jovian system. THE STAR IDENTIFICATION, POINTING AND TRACKING SYSTEM OF UVSTAR, AN ATTACHED PAYLOAD INSTRUMENT SYSTEM FOR THE SHUTTLE HITCHHIKER-M PLATFORM c19
Francesco DeCarlo, Roberto Stalio, Paolo Trampus, A. Lyle Broadfoot (Arizona Univ., Tucson.), Bill R. Sandel (Arizona Univ., Tucson.), and Giovanni Sicuranza *In* NASA. Goddard Space Flight Center, The 1993 Shuttle Small Payloads Symposium Oct. 1993 p 153-167 (For primary document see N94-19162 04-12)
Avail: CASI HC A03/MF A03

We describe an algorithm for star identification and pointing/tracking of a spaceborne electro-optical system and simulation analyses to test the algorithm. The algorithm will be implemented in the guiding system of UVSTAR, a spectrographic telescope for observations of astronomical and planetary sources operating in the 500-1250 A waveband at approximately 1 A resolution. The experiment is an attached payload and will fly as a Hitchhiker-M payload on the Shuttle. UVSTAR includes capabilities for independent target acquisition and tracking. The spectrograph package has internal gimbals that allow angular movement of plus or minus 3 deg from the central position. Rotation about the azimuth axis (parallel to the Shuttle z axis) and elevation axis (parallel to the Shuttle x axis) will actively position the field of view to center the target of interest in the fields of the spectrographs. The algorithm is based on an on-board catalog of stars. To identify star fields, the algorithm compares the positions of stars recorded by the guiding imager to positions computed from the on-board catalog. When the field has been identified, its position within the guiding imager field of view can be used to compute the pointing corrections necessary to point to a target of interest. In tracking mode, the software uses the past history to predict the quasi-periodic attitude control motions of the shuttle and sends pointing commands to cancel the motion and stabilize UVSTAR on the target. The guiding imager (guider) will have an 80-mm focal length and f/1.4 optics giving a field of view of 6 deg x 4.5 deg using a 385 x 288 pixel intensified CCD. It will be capable of providing high accuracy (better than 2 arc-sec) attitude determination from coarse (6 deg x 4.5 deg) initial knowledge of the pointing direction; and of pointing toward the target. It will also be capable of tracking at the same high accuracy with a processing time of less than a few hundredths of a second. Author

Over the past 27 years, the U.S. Air Force, as executive agent for the Department of Defense (DOD) Space Test Program, has flown approximately 325 space experiments for the Army, Navy, Air Force, and other DOD agencies. These experiments have made significant contributions to the improvement of military technology and operations. Flight of Space Test Program experiments has been carried out utilizing free flyer spacecraft, the Space Shuttle crew cabin, and the Space Shuttle cargo bay. This paper will concentrate on those experiments which have been flown by the NASA Space Shuttle small payload flight systems, e.g., GAS, uprated GAS (CAP), and Hitchhiker flight systems. Discussions of Space Test Program experiments flown by Space Shuttle small payloads flight systems will include the experiment objectives, the accommodations and services provided by the flight systems, experiment results, and lessons learned from the planning and conduct of the flight. Particular emphasis will be placed on those experiments which required and were provided with a new and unique capability by the small payloads flight systems. These capabilities include the first use of the GAS opening lid, the first use of the GAS payload ejection capability, and the first use of the Hitchhiker cross bay carrier. Author

SPNDL: A CONCEPT FOR A SMALL SATELLITE DOPPLER LIDAR WIND SOUNDER **c47**
G. D. Emmitt and M. M. Sokoloski (Science and Technology Corp., Washington, DC.) *In* NASA. Goddard Space Flight Center, The 1993 Shuttle Small Payloads Symposium Oct. 1993 p 179-191 (For primary document see N94-19162 04-12)
Avail: CASI HC A03/MF A03

Given current resources and the technical challenges in developing a full coverage space-based Doppler lidar wind measuring system such as LAWS (Laser Atmospheric Wind Sounder), it is not likely that the science community will have data streams with which to work before the end of this decade. Currently, a 'fast track' demonstration mission is being seriously considered by several U.S. agencies. Such a mission would have as its primary objectives the demonstration of coherent Doppler lidar technology in space and the delivery of wind observations for science algorithm evaluation and development. However, for such a mission to be achieved at modest costs and within a short time frame, deviations from the full system design are required. Simulation models have been developed over the last decade to aide in the design of Doppler lidar missions and to provide simulated data for use in wind computation algorithm development. SWA has used both models to examine some options that might be cost-effective for a demonstration mission. Over the past few months, Simpson Weather Associates has been studying SPNDL (Spinning Platform with a Non-rotating telescope Doppler Lidar), a new concept for Doppler lidar wind observations from space. Science and Technology Corporation has an interest in participating in an engineering and shuttle accommodation study for SPNDL. Author

YOUR GAS EXPERIMENT AND THE MEDIA OR WHY DOES THAT OTHER CAN GET ALL OF THE PUBLICITY? Abstract Only
Philip Chien *In* NASA. Goddard Space Flight Center, The 1993 Shuttle Small Payloads Symposium Oct. 1993 p 193 (For primary document see N94-19162 04-12)
Avail: CASI HC A01/MF A03

NASA has flown almost 100 Get Away Special (GAS) cans. Only a few of them are remembered by the general public, including the 'snowflakes in space' from STS-6, 'ants in space' from STS-7, and CanDO from STS-57. Why do some GAS cans get all of the publicity, while others are barely mentioned in press conferences, press kits, and on NASA Select during the mission? How can you make sure your GAS can gets as much attention as the others on your flight? And why is it important for you to make sure the public finds out about your activities? Writer Philip Chien has covered the space program since 1983, and is a regular participant in GAS press conferences. This paper will use STS-57 as a case study showing why some GAS cans got more publicity than others. The paper will offer advice for upcoming GAS payloads and how to prepare your press kits and other handouts. Author

ISOBUS: A NEW VERSATILE SPACECRAFT PLATFORM USING SHUTTLE SMALL PAYLOADS **c18**
David Tamir, Rex W. Ridenoure (Jet Propulsion Lab., California Inst. of Tech., Pasadena.), and R. Gilbert Moore (Utah State Univ., Logan.) *In* NASA. Goddard Space Flight Center, The 1993 Shuttle Small Payloads Symposium Oct. 1993 p 195-198 (For primary document see N94-19162 04-12)
Avail: CASI HC A01/MF A03

The new NASA credo of 'faster, better, cheaper' calls for a new generation of smaller and less complex spacecraft. In response to this challenge, many new spacecraft concepts have been generated within NASA, industry, and academia. The JPL, Rockwell International Space Systems Division, and The Space Dynamics Laboratory (SDL)/Utah State University (USU) are jointly examining one such new spacecraft concept, hereafter termed ISOBUS, which is derived from recent research and development work in isogrid structures based on a six-sided hexagon shaped structure. Two prototypical products from SDL/USU's work are ISOSPACEPACK and ISOSAT. These hexagon shaped elements serve as building blocks for the ISOBUS spacecraft concept. Various aspects of the ISOBUS concept are discussed. Derived from text

The RH-3000 program is developing a rad-hard space qualified 32-bit MIPS R-3000 RISC processor under the Naval Research Lab sponsorship. In addition, under IR&D Harris is developing RHC-3000 for embedded control applications where low cost and radiation tolerance are primary concerns. The development program leverages heavily from commercial development of the MIPS R-3000. The commercial R-3000 has a large installed user base and several foundry partners are currently producing a wide variety of R-3000 derivative products. One of the MIPS derivative products, the LR33000 from LSI Logic, was used as the basis for the design of the RH-3000 chipset. The RH-3000 chipset consists of three core chips and two support chips. The core chips include the CPU, which is the R-3000 integer unit and the FPA/MD chip pair, which performs the R-3010 floating point functions. The two support whips contain all the support functions required for fault tolerance support, real-time support, memory management, timers, and other functions. The Harris development effort had first passed silicon success in June, 1992 with the first rad-hard 32-bit RH-3000 CPU chip. The CPU device is 30 kgates, has a 508 mil by 503 mil die size and is fabricated at Harris Semiconductor on the rad-hard CMOS Silicon on Sapphire (SOS) process. The CPU device successfully passed tesing against 600,000 test vectors derived directly on the LSI/MIPS test suite and has been operational as a single board computer running C code for the past year. In addition, the RH-3000 program has developed the methodology for converting commercially developed designs utilizing logic synthesis techniques based on a combination of VHDK and schematic data bases. SUPERFLUID HELIUM ON-ORBIT TRANSFER (SHOOT) FLIGHT DEMONSTRATION
Peter Shirron, Michael DiPirro, Jim Tuttle, Steve Volz, and Neal Barthelme *In its* The 1993 Shuttle Small Payloads Symposium Oct. 1993 p 201 (For primary document see N94-19162 04-12)
Avail: CASI HC A01/MF A03

The Superfluid Helium On-Orbit Transfer (SHOOT) Flight Demonstration was an attached Shuttle payload mounted on a Hitchhiker cross-bay carrier which flew on STS-57 in June of 1993. SHOOT successfully demonstrated the handling and transfer of superfluid helium between two containers, called dewars, in low gravity. SHOOT was a class C payload and for the STS-57 mission was termed a complex secondary payload. The primaries were the retrieval of the EURECA carrier and a collection of modular experiments contained in SPACEHAB. Because the liquid helium was continuously boiling off, SHOOT's activities were scheduled for the first three days of the mission, concurrent with some SPACEHAB experiments, but well before the EURECA retrieval. Control of the SHOOT experiment was highly interactive and originated primarily from the Goddard Payload Operations and Control Center (POCC). Transfer and calibration activities required continuous command windows of up to 50 minutes duration and up to 80 minutes out of each orbit. Occasionally the crew controlled the experiment using the Payload General Support Computer (PGSC) when near-real time control and monitoring was required. SHOOT also placed considerable demands on the orbiter, including a pitch rotation of 3 deg./sec for 15 minutes, and translational burns using both the aft and forward RCS jets to generate accelerations up to 7 milli-g. The basis for these and other requirements are discussed. Interacion with the crew and timing of crew activity during the mission will be detailed. The processing flow of SHOOT at KSC is described with emphasis on the tradeoffs for vertical, as opposed to horizontal, installation in the orbiter. Finally, some lessons learned are presented that are relevant to future cryogenic and Hitchhiker payloads. Author (revised)

The Cluster mission, which will study the three dimensional dynamic behavior of small scale structures in the Earth's plasma environment, is addressed. Descriptions of the eleven instruments, the spacecraft design, the ground segment, the scientific operations planned by ESOC for the Joint Science Operations Center, and the Cluster science data system are described. To achieve the scientific goals of the mission, attempts were made from the very beginning to cooperate with the plasma simulations community and with the ground observations community. The activities of these two communities in support of Cluster are described. Two candidate orbits for Cluster are discussed. For individual titles, see N94-19623 through N94-19641.

In order to get the maximum scientific return from available spacecraft resources, the wave experimenters on Cluster established the Wave Experiment Consortium (WEC), the scientific objectives of which are described, together with its capability to achieve them in the course of the mission. Their aims include the characterization of plasma waves and turbulence, and the assessment of their role in the 'anomalous' behavior of critical layers. The five experiments and the interfaces between them are shown in a general block diagram. The need for technical coordination led to the formation of a Wave Experiment Consortium Technical Coordination Office (WECTCO), the tasks of which are described. The planned modes of operation of the WEC experiments are described. ESA

A technical description of the Spatio Temporal Analysis of Field Fluctuations (STAFF) experiment, which is to be implemented on the four Cluster spacecraft and which consists of a triaxial search coil magnetometer to measure the magnetic components of electromagnetic fluctuations (up to 4 kHz) and of a spectrum analyzer to perform on board each satellite the auto and cross correlation coefficients of the spectral matrix, using three magnetic and two electric components of the waves, is given. Details of the instrument's various inflight operational modes are also given. The magnetic waveform up to either 10 or 180 Hz is also transmitted. STAFF is one of the five complementary experiments which form the Wave Experiment Consortium (WEC). Some of the scientific objectives are discussed, the main one being the study of the electromagnetic fluctuations in the key regions of solar wind/magnetosphere interaction. Some of the methods by which the wave data characteristics are determined are mentioned. ESA

The WHISPER (Waves of High frequency and Sounder for Probing Electron density by Relaxation) experiment, whose primary objective is the accurate measurement of the total plasma density within the range from 0.2 to 80 cu cm, is presented. The WHISPER experiment is included in the payload of Cluster. The measurement of the plasma density is achieved by means of a resonance sounding technique which has proved successful in ionospheric dense plasma as well as in dilute space plasmas. The relaxation sounder can also be used as a natural wave receiver and then fulfils the second objective of WHISPER: to provide a continuous survey of one electric component of plasma waves in the frequency range from 4 to 80 kHz with a resolution of about 300 Hz at best. The Cluster Wideband (WBD) Plasma Wave investigation which is designed to provide high resolution frequency/time spectra of plasma waves in the Earth's magnetosphere is reported. Wideband measurements are important for identifying and studying plasma emissions that have very complex frequency/time characteristics. As part of the Wave Experiment Consortium (WEC), the WBD instrument provides measurements of both electric and magnetic fields in selected frequency bands from 25 Hz to 577 kHz. Continuous waveforms are digitized, formatted, and transferred to the spacecraft telemetry system using either a 220 kbit/s real time mode or a 73 kbit/s burst mode. The real time data require direct acquisition by a NASA Deep Space Network (DSN) receiving station, and the burst mode data are stored on the spacecraft tape recorder for later playback. On the ground the waveforms are Fourier transformed to provide high resolution frequency/time spectrograms. The WBD measurements complement those of the other WEC instruments and also provide unique new capabilities such as very long baseline interferometry. ESA

The implementation of the Digital Wave Processing (DWP) experiment, which will be flown on the four ESA/NASA Cluster satellites as a component of the Wave Experiment Consortium (WEC), is reported. The wide variety of geophysical plasmas that will be investigated by the Cluster mission contain waves with a frequency range from DC to over 100 kHz with both magnetic and electric components. The characteristic duration of these waves extends from a few milliseconds to minutes and a dynamic range of over 90 dB is desired. All of these factors make it essential that the onboard control system for the WEC instruments be flexible so as to make effective use of the limited spacecraft resources of power and telemetry information bandwith. The processing system within the DWP instrument will also perform particle and wave/particle correlations in order to permit the direct study of wave/particle interactions. The DWP instrument employs a novel architecture based on the use of transputers with parallel processing and reallocatable tasks to provide a high reliability system. ESA

Copyright Avail: CASI HC A03/MF A03; ESA, EPD, ESTEC, Noordwijk, Netherlands, HC

The Cluster magnetic field investigation is presented. Cluster represents a qualitatively new type of space mission which will provide, for the first time, a three dimensional view of small scale plasma processes and structures in the different regions in and around the Earth's magnetosphere. Concepts of data analysis needed to interpret the four spacecraft magnetic field data in terms of magnetospheric processes and structures are outlined. The instrument itself, a vital component of the scientific payload, follows a long tradition of fluxgate magnetometers on space missions, yet represents an evolution in terms of built in functions and reliability. A detailed description of the instrument is given with emphasis on those aspects that are unique to the mission. ESA

The scientific objectives, the experimental method, and the technical realization of the various elements of the Electron Drift Instrument (EDI) for the Cluster mission are reported. The EDI measures the drift of a weak beam of test electrons that, when emitted in certain directions, return to the spacecraft after one gyration. This drift is related to the electric field and the gradient in the magnetic field, and these quantities can, by the use of different electron energies, be determined separately. As a by product, the magnetic field strength is also measured. ESA

The Cluster Ion Spectrometry (CIS) experiment on board the four Cluster spacecraft and which consists of a comprehensive ionic plasma spectrometry package capable of obtaining full three dimensional ion distributions with high time resolution (in one spacecraft spin) and mass per charge resolution is presented. The broad scientific objectives and the wide dynamic range cannot be covered with a single instrument. Consequently, the CIS experiment comprises two different instruments, a Hot Ion Analyzer (HIA) and a time of flight ion Composition and Distribution Function (CODIF) analyzer. These sensors are controlled by a dual processor based Data Processing System (DPS), which permits extensive onboard processing. Both instruments use symmetrical top hat analyzers which provide a continuous, uniform, and well characterized phase-space coverage. The CODIF determines the distributions of the major ion species with energies from spacecraft potential to 40 keV/e with an angular resolution of 22.5 by 10.25 deg and with two different sensitivities. The HIA does not provide mass measurements, but extends the dynamic range to the highest ion fluxes, and has the necessary angular resolution capability (5.6 by 5.6 deg) for ion beam and solar wind measurements. The RAPID spectrometer for the Cluster mission, an advanced particle detector for the analysis of suprathermal plasma distributions in the energy range from 20 to 400 keV and from 2 keV/nuc to 1500 keV for electrons and ions, respectively, is presented. Novel detector concepts in combination with pinhole acceptance permit the measurement of angular distributions over a range of 180 deg in polar angle for either species. The detection principle for the ionic component is based on a two dimensional analysis of a particle's velocity and energy. Electrons are identified by the well known energy range relationship. The detection techniques are described and selected areas in geospace are used to highlight the scientific objectives of this investigation. ESA

The design of the Active Spacecraft Potential Control (ASPOC) instrument on the Cluster spacecraft is presented with focus on the ion emitters. The ion emitters are of the liquid metal ion source type and are used for charge neutralization. The emitters will produce indium ions at approximately 6 KeV. The ion current will be adjusted in a feedback loop with instruments measuring the spacecraft potential. A stand alone mode is seen as a backup. The operating principle of the ASPOC is field evaporation of indium in the apex field of a needle. The advantages are low power consumption, compactness, and high mass efficiency. ESA

An overview of the Cluster mission and system design is given. The spacecraft design and performance characteristics are addressed. The program for Cluster, which is based on a development philosophy incorporating six spacecraft models (one structural model, one engineering model and four flight spacecraft) is addressed. The Cluster mission is a 'first' for the ESA in that it requires the delivery of four identical spacecraft for simultaneous launch on a single launch vehicle. This series production of spacecraft to meet a unique launch opportunity has never before been attempted and represents a serious challenge to ESA, industry and the experimenters. The mission relies on the four spacecraft being placed in near identical eccentric polar orbits with a tetrahedal configuration achieved at the cusp region of the magnetosphere. The launch vehicle chosen for the mission is the first Ariane 5 qualification flight in late 1995 and the launch opportunity is offered under the APEX Program. ESA

The Cluster ground segment and mission operations, which were designed to permit the transfer of the four spacecraft into the required mission orbit in such a way that they will form a tetrahedral configuration with predefined separation distances when crossing the regions of scientific interest, is presented. The spatial configuration will be adjusted for different phases of the mission. Scientific mission planning inputs and command requests originating from the Principal Investigators (PI's) are considered. The scientific data will be distributed to the scientific community on a hard raw data medium, though PI's will in addition have access to quick look data via an electronic network. ESA

The selection of Cluster's operational orbit and its relation with new magnetic field models is reviewed, and the optimization of a multiple maneuver control strategy to achieve the required three dimensional spacecraft configuration is analyzed. The Cluster mission is based on four almost identical spacecraft placed into orbits that take them through the regions of scientific interest of geomagnetic space. The orbits were selected so as to ensure coverage of the northern polar cusp region and the geotail, and to optimize the coverage of the magnetopause, the bow shock and the solar wind. The four Cluster spacecraft will be controlled in such a way that, at selected points of their orbits, they will achieve a configuration in which each spacecraft is at the vertex of a tetrahedron with the required interspacecraft distances. The design of the orbit of each spacecraft depends on the position and structure of certain regions of the magnetic field of the Earth perturbed by the Sun. The characteristics of these regions depend on the position of the Earth's magnetic dipole with respect to the Sun and on the Sun's activity. Their motion is, therefore, unpredictable. ESA

The distributed science data system attached to Cluster and ESA/NASA four spacecraft mission, designed to permit the study of plasma processes in three dimensions using the combined data from eleven instruments on each spacecraft, is addressed. A wide scientific community that will wish to use Cluster data will have differing data rights, experience and means of access. Users will include those working primarily with other data sets, and the use of more than one set of data is essential to the mission. The community includes people belonging to some twenty nations. The Cluster Science Data System (CSDS) is distributed across seven national data centers in Europe, one in the U.S., and possibly one in China. ESANET

will be used to interconnect the data centers and the spacecraft Operations Control Centre at European Space Operations Centre, Darmstadt. The European Space Information System (ESIS) will provide the user interface.

The prime scientific topics for the planned Cluster/ground based coodination are identified and the main advantages of using coordinated observations from Cluster and ground based instruments are addressed. Some of the instruments that are expected to participate in the Cluster/ground based coordination are listed. The preparation of reduced ground based data sets in the form of indices, summary data sets, and refined high resolution data is addressed. The establishment of a common data base is considered. Interface with other satellite missions or coordinated ground based activities is discussed.

The European Numerical Simulation Network (ENSN), which is comprised of ten European groups experienced in working on the numerical simulation of space plasmas, is addressed. The network aims at providing theoretical support in the preparation of ESA's Cluster mission. The following ENSN tasks which have been identified as essential are discussed: the setting up of thematic working groups to direct specific efforts on the prime objectives of the Cluster mission; the development of new numerical simulation codes with emphasis on the tools that will be necessary to investigate the physics of the boundary layers that are the prime scientific targets of Cluster; the sharing of the development of the visualization software necessary for the display of numerical simulation results on work stations; the development of software models of Cluster instruments and the implementation of these software models into numerical simulations runs.

This study was instituted to assist NASA and MSFC in the development of ground and flight options to demonstrate the capability of Automated Rendezvous and Capture (AR&C). Study goals placed emphasis on low cost approaches and the need to be responsive to newly developing programs and studies such as Space Station Freedom and the Cargo Transfer Vehicle. This study provides an assessment of vehicle options and AR&C requirements to assist in the meaningful development of an AR&C capability. This report documents study activities performed at Applied Research, Inc. (ARI) between 1 Apr. 1992 and May 1993.

AN EVOLUTIONARY APPROACH TO SPACE LAUNCH COMMERCIALIZATION
Brian G. Chow 1993 134 p
(Contract MDA903-90-C-0004)
(AD-A269861) Avail: CASI HC A07/MF A02

The findings and recommendations of this study fall into two groups: Department of Defense (DoD) space launch procurement and DoD steps to strengthen U.S. launch competitiveness. Our analytic results support the choices that the Air Force and the Navy have made since 1985 in the methods of procuring launch services and in the degree of government oversight stipulated in these launch contracts. We further found that the Air Force's upcoming Medium Launch Vehicle-3 (MLV-3) procurement is DoD's most suitable major program to be procured with commercial practices over the next ten years. We recommend that the MLV-3 Request For Proposal (RFP) include commercial launches as an option and that the Air Force consider this option. To help strengthen launch competitiveness, we recommend that DoD concentrate its new launcher development on the most commercially relevant (MCR) range, which is the capability to lift 10,000 to 50,000 lbs of payload into low earth orbits (LEO's).

DYNAMIC RESPONSE ANALYSIS OF COMPOSITE STRUCTURAL MEMBERS DURING MISSILE LAUNCH
Lianzhu He and Peiling Zhao 14 Sep. 1993 12 p Transl. into ENGLISH from Hangkong Xuebao (Aeronautics), China, v. 13, no. 8 Aug. 1992 p 448-451 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A270023; FASTC-ID(RS)T-0201-93) Avail: CASI HC A03

By analyzing the dynamic characteristics and the dynamic response of composite structural members of aircraft wings, the article presents the methods and steps for computational analysis, as well as further processing of the analytical results, in addition to suggestions for design improvements. It was found that improved lamina design can eliminate design weakness since local vibration phenomena were discovered in the prototype design when the dynamic characteristics of structural members were analyzed. By comparing three computational missile launch variants for outboard wing, mid-wing, and inner-wing, the values of the dynamic response in the most serious situation are given. Finally, the dynamic strength is determined. DTIC

(NASA-TM-104780; S-740; NAS 1.15:104780) Avail: CASI HC A05/MF A01

Work completed under the Human Transportation System Study is summarized. This study was conducted by the New Initiatives Office at JSC with the technical support of Boeing, General Dynamics, Lockheed, McDonnell-Douglas, Martin Marietta, and Rockwell. The study was designed to generate information on determining the appropriate path to follow for new system development to meet the Nation's space transportation needs. The study evaluates 18 transportation architecture options using a parametric set of mission requirements. These options include use of current systems as well as proposed systems to assess the impact of various considerations, such as the cost of alternate access, or the benefit of separating people and cargo. The architecture options are compared to each other with six measurable evaluation criteria or attributes. They are the following: funding profile, human safety, probability of mission success, architecture cost risk, launch schedule confidence, and environmental impact. Values for these attributes are presented for the architecture options, with pertinent conclusions and recommendations. Author (revised)

A STEREOSCOPIC VISION SYSTEM WITH APPLICATIONS TO AUTOMATED DOCKING AND TRACKING Trident Scholar Project Report No. 201
Michael M. Hsu 17 May 1993 80 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A270754) Avail: CASI HC A05

A current project of great importance to the National Aeronautics and Space Administration is the development of an automated docking and tracking system to facilitate autonomous operations in space. Such a system would have to be able to determine the relative positions, velocities, and orientations of a multitude of bodies. A stereoscopic vision system was developed to implement an automated docking solution. This system used artificial neural networks to identity beacons or fixed points on the objects to be tracked. Specifically, this research sought to solve the problems inherent in the planned 1995 docking of the U.S. Space Shuttle to the former Soviet Space Station Mir. In addition to the basics of an optical ranging and object-recognition system, a simple user interface for operation monitoring was designed. Specifically, the coordinates of the Space Station, shuttle waypoints, and smooth trajectory position, velocity, and acceleration information were calculated and displayed. A mock docking was also simulated, with the vision system providing the range and orientation data. By placing the vision system at known coordinates and checking its computed trajectory, the accuracy of the algorithms and given hardware were checked. DTIC

PACKAGING, DEPLOYMENT, AND PANEL DESIGN CONCEPTS FOR A TRUSS-STIFFENED 7-PANEL PRECISION DEPLOYABLE REFLECTOR WITH FEED BOOM
Walter L. Heard, Jr., Timothy J. Collins, James W. Dyess, Scott Kenner, and Harold G. Bush Nov. 1993 33 p
(RTOP 506-43-41-02)
(NASA-TM-109000; NAS 1.15:109000) Avail: CASI HC A03/MF A01

A concept is presented for achieving a remotely deployable truss-stiffened reflector consisting of seven integrated sandwich panels that form the reflective surface, and an integrated feed boom. The concept has potential for meeting aperture size and surface precision requirements for some high-frequency microwave remote sensing applications. The packaged reflector/feed boom configuration is a self-contained unit that can be conveniently attached to a spacecraft bus. The package has a cylindrical envelope compatible with typical launch vehicle shrouds. Dynamic behavior of a deployed configuration having a 216-inch focal length and consisting of 80-inch-diameter, two-inch-thick panels is examined through finite-element analysis. Results show that the feed boom and spacecraft bus can have a large impact on the fundamental frequency of the deployed configuration. Two candidate rib-stiffened sandwich panel configurations for this application are described, and analytical results for panel mass and stiffness are presented. Results show that the addition of only a few rib stiffeners, if sufficiently deep, can efficiently improve sandwich panel stiffness. Author

PREDICTED STRUCTURAL RESPONSE OF THE LIGHTWEIGHT-INTERCEPTOR TECHNOLOGY DEMONSTRATION VEHICLE
D. J. Trummer and S. M. Bahowick 1 Nov. 1992 64 p
(Contract W-7405-eng-48)
(DE93-014676; UCRL-ID-112131) Avail: CASI HC A04/MF A01 (US Sales Only)

The Advanced Implementation Technology Program (AIT) at Lawrence Livermore National Laboratory has been participating in the development of a lightweight-interceptor technology demonstration vehicle. This vehicle, commonly referred to as a probe, is a small spacecraft that is self-contained, lightweight, and highly maneuverable. The probe contains a guidance and control system that requires complete information on the dynamic response of the probe during operation. A finite element model of the probe was generated to provide information on the dynamic response of the probe when subjected to launch and operational loads. In order to validate the analytical results, a mass mockup of the probe was constructed and an experimental modal survey was performed to determine the natural frequencies, mode shapes, and damping values for each natural mode of the mockup. The results of the modal survey were then compared with the finite element model, and the necessary changes were incorporated into the finite element model. The validated finite element model could then be used to study the impact of structural or loading changes on probe mechanical vibration modes and sensor deflections. DOE

UVPI IMAGING FROM THE LACE SATELLITE: THE NIHKA ROCKET PLUME Interim Report
H. W. Smathers, D. M. Horan, J. G. Cardon, E. R. Malaret, and J. E. Brandenburg 12 Jul. 1993 92 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A268456; NRL/FR/8121-93-9537) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The Nihka flight was the first demonstration of the ability of the Ultraviolet Plume Instrument (UVPI), carried abroad the LACE (Low-power Atmospheric Compensation Experiment) satellite, to observe missiles in flight above the atmosphere. The UVPI is a small, plume-tracking instrument flown on the Naval Research Laboratory's LACE satellite, which was launched on 14 Feb. 1990. The Nihka was launched from the Wallops Island Launch Facility in Virginia to coincide with a LACE pass. The two cameras of the UVPI were used to observe the Nihka in the ultraviolet. These cameras were a tracker camera, viewing over a relatively wide field and broad spectrum, and a plume camera that has a narrow field of view (0.180 deg by 0. 135 deg) and can observe sources through any of four filters. A three-stage sounding rocket (called Black Brant X) was used for the test. The third stage, or Nihka, reached 190 km altitude and was successfully detected and tracked by the UVPI from a range of 448 to 463 km. The Nihka plume was successfully tracked for 3.23 seconds; 91 images of plume data (each 1/30th of a second) were acquired by using the first plume-camera filter in the 235 to 350 nm range. DTIC

SPACE DEBRIS DETECTION Final Report, 7 Mar. 1991 - 6 Nov. 1992
Robert H. Eather 23 Dec. 1992 40 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F19628-91-C-0054)
(AD-A269254; PL-TR-93-2058) Avail: CASI HC A03

A feasibility study on the possibility of detecting less than or = 10 cm space debris using a large-aperture ground-based telescope (with an intensified CCD detector) was completed, showing that detection should be possible. A detector system was designed and built, and installed on the 2.54 m WRDC telescope at Wright Patterson AFB. Bad seeing conditions in the Dayton area prevented the expected debris detection. Subsequently, a small 40 cm telescope was built and operated from the Haystack Observatory (Groton, MA). Known objects were used to test pointing and acquisition procedures, and the system was then shipped to Rattlesnake Observatory (Richland, WA) for participation in the ODERAC's debris calibration experiment from the Space Shuttle. This experiment failed, and our instrument has been stored at Rattlesnake in anticipation of a new ODERAC's flight in late 1993. DTIC

CONTACT: AN AIR FORCE TECHNICAL REPORT ON MILITARY SATELLITE CONTROL TECHNOLOGY Final Report, Jan. - Jun. 1993
Christopher K. Weakley 9 Jul. 1993 52 p
(AD-A269375) Avail: CASI HC A04/MF A01

This technical report focuses on Military Satellite Control Technologies and their application to the Air Force Satellite Control Network (AFSCN). This report is a compilation of articles that provide an overview of the AFSCN and the Advanced Technology Program, and discusses relevant technical issues and developments applicable to the AFSCN. Among the topics covered are articles on Future Technology Projections; Future AFSCN Topologies; Modeling of the AFSCN; Wide Area Communications Technology Evolution; Automating AFSCN Resource Scheduling; Health & Status Monitoring at Remote Tracking Stations; Software Metrics and Tools for Measuring AFSCN Software Performance; Human-Computer Interface Working Group; Trusted Systems Workshop; and the University Technical Interaction Program. In addition, Key Technology Area points of contact are listed in the report. DTIC

PARALLELIZATION OF THE AIR FORCE SPACE COMMAND (AFSPACECOM) SATELLITE MOTION MODELS M.S. Thesis
Sara R. Ostrom Mar. 1993 93 p
(AD-A269327) Avail: CASI HC A05/MF A01

The Air Force Space Command (AFSPACECOM) uses an analytic satellite motion model based on the Brouwer theory, referred to as SGP4, for near-earth objects, and another satellite motion model based on the work of Hujsak, referred to as SDP4, for deep-space objects. These models assist in tracking over 7000 objects around the Earth each day. Original satellite motion model used by the AFSPACECOM based on the work of Kozai and Brouwer, known as the Simplified General Perturbations model or SGP, is an analytic model still being used at several sites. Based on the increasing number of space objects that require tracking and the desire for accuracy, there is a growing need to reduce computation time in implementing satellite motion models. Parallel computing offers one method to achieve this objective. This thesis investigates the parallel computing potential of SGP, SGP4, and SDP4 using the Intel iPSC/2 hypercube multicomputer. This thesis chooses a parallel algorithm and applies it to SGP, SGP4, and SDP4 for implementation on the hypercube, and reports on the potential reduction in computer time by first considering only the calculational portion of the algorithm and then including the effects of the reading and writing portions. CONSTANT-THRUST ORBIT-RAISING TRANSFER CHARTS Final Report, Aug. 1992 - May 1993
Salvatore Alfano and James D. Thorne Jul. 1993 23 p
(AF Proj. 2181)
(AD-A269088; AD-E201589; PL-TR-93-1010) Avail: CASI HC A03/MF A01

This report outlines a method to generate minimum-fuel trajectories between coplanar circular orbits for a vehicle with constant thrust. The rocket equation models the effects of continuous fuel expenditure while also serving to recast the solution in terms of accumulated velocity change. These orbit-raising solutions are globally mapped with no restrictions on initial thrust magnitude, intermediate eccentricity, or number of revolutions of the central body. Several examples are presented to verify the transfer charts and familiarize the reader with their use. These charts are useful tools for mission planners and satellite designers to assess preliminary fuel requirements for constant-thrust systems or to compare different propulsion technologies. DTIC

The Lawrence Livermore National Laboratory is engaged in a technology development project which includes designing a lightweight, autonomous, highly maneuverable space vehicle, commonly referred to as a probe. The current probe design includes a guidance and control system that requires complete information on the dynamic response of the probe during operation. A finite element model of the probe was constructed to provide analytical information on the dynamic response to specific operational inputs. In order to verify the assumptions made in the model, a mass mock-up of the probe was constructed at LLNL and an experimental modal survey was performed to determine the frequencies, damping values and deflection shapes for each natural mode of the mock-up. The experimental modal parameters were compared with the parameters obtained through modal analysis of the finite element model to provide a measure of the correlation between the model and the actual structure. This report describes the experimental modal testing and analysis of the mass mock-up and compares the experimental results with the finite element results. DOE

The production of large quantities of spacecraft needed by SDIO will require a cultural change in design and production practices. Low rates of production and the need for exceedingly high reliability has driven the industry to custom designed, hand crafted, and exhaustively tested satellites. These factors have mitigated against employing design and manufacturing cost reduction methods commonly used in tactical missile production. Additional challenges to achieving production efficiencies are presented by the SDI spacecraft mission requirement. IR sensor systems, for example, are comprised of subassemblies and components that require the design, manufacture, and maintenance of ultra-precision tolerances over challenging operational lifetimes. These IR sensors demand the use of reliable, closed loop, cryogenic refrigerators or active cryocoolers to meet stringent system acquisition and pointing requirements. The authors summarize some spacecraft cryocooler requirements and discuss observations regarding industry's current production capabilities of cryocoolers. The results of the Lawrence Livermore National Laboratory (LLNL) Spacecraft Fabrication and Test (SF&T) MODIL's Phase I producibility demonstration project is presented. DOE

[ACTIVITIES OF THE CENTER FOR SPACE CONSTRUCTION] Annual Report, 1 October 1992 - 30 Sep. 1993
1 Oct. 1993 88 p
(Grant NAGw-1388)
(NASA-CR-193717; NAS 1.26:193717) Avail: CASI HC A05/MF A01

The Center for Space Construction (CSC) at the University of Colorado at Boulder is one of eight University Space Engineering Research Centers established by NASA in 1988. The mission of the center is to conduct research into space technology and to directly contribute to space engineering education. The center reports to the Department of Aerospace Engineering Sciences and resides in the College of Engineering and Applied Science. The college has a long and successful track record of cultivating multi-disciplinary research and education programs. The Center for Space Construction is prominent evidence of this record. At the inception of CSC, the center was primarily founded on the need for research on in-space construction of large space systems like space stations and interplanetary space vehicles. The scope of CSC's research has now evolved to include the design and construction of all spacecraft, large and small. Within this broadened scope, our research projects seek to impact the underlying technological basis for such spacecraft as remote sensing satellites, communication satellites, and other special purpose spacecraft, as well as the technological basis for large space platforms. The center's research focuses on three areas: spacecraft structures, spacecraft operations and control, and regolith and surface systems. In the area of spacecraft structures, our current emphasis is on concepts and modeling of deployable structures, analysis of inflatable structures, structural damage detection algorithms, and composite materials for lightweight structures. In the area of spacecraft operations and control, we are continuing our previous efforts in process control of in-orbit structural assembly. In addition, we have begun two new efforts in formal approach to spacecraft flight software systems design and adaptive attitude control systems. In the area of regolith and surface systems, we are continuing the work of characterizing the physical properties of lunar regolith, and we are at work on a project on path planning for planetary surface rovers. START USER MANUAL VERSION 2.1
E. Mooij Jul. 1993 119 p
(LR-726; ETN-93-95030) Avail: CASI HC A06/MF A02

The Simulation Tool for Atmospheric Reentry Trajectories (START) version 2.1 is presented. The software is capable of doing six degrees of freedom reentry simulations, starting with a deorbit burn maneuver in orbit. After the atmospheric entry, the descent under a parachute can be simulated as well. Central bodies included are: Earth, the Moon, Mars and Titan. The program was equipped with a menu oriented user interface, giving full access to the input data. The manual is focused on how to use the software. Before discussing the capabilities of START, a short overview of START and some general remarks on the user interface are given. ESA

UVPI IMAGING FROM THE LACE SATELLITE: THE STRYPI ROCKET PLUME Interim Report
H. W. Smathers, D. M. Horan, J. G. Cardon, E. R. Malaret, and M. Singh 17 Sep. 1993 268 p
(AD-A270967; NRL/FR/8121-93-9526) Avail: CASI HC A12/MF A03

The Ultraviolet Plume Instrument (UVPI) is a small plume-tracking instrument that was flown on the Naval Research Laboratory's Low-power Atmospheric Compensation Experiment (LACE) satellite. The UVPI plume camera has a narrow field of view (0.180 deg by 0.135 deg), and it observes sources through any of four filters with passbands of 195 to 295 nm, 220 to 320 nm, 235 to 350 nm, and 300 to 320 nm. The Strypi rocket was launched from Hawaii on 18 Feb. 1991. The second (Antares) and the third (Star 27) stages reached 110 km altitude and were successfully detected and tracked by the UVPI from a range of 450 to 550 km. The spectral radiance and spectral radiant intensities of the missile plumes were extracted from these images for the four passbands. DTIC

Application of electrothermal arcjets on communications satellites requires assessment of integration concerns identified by the user community. Perceived risks include plume contamination of spacecraft materials, induced arcing or electrostatic discharges between differentially charged spacecraft surfaces, and conducted and radiated electromagnetic interference (EMI) for both steady state and transient conditions. A Space Act agreement between Martin Marietta Astro Space, the Rocket Research Company, and NASA's Lewis Research Center was established to experimentally examine these issues. Spacecraft materials were exposed to an arcjet plume for 40 hours, representing 40 weeks of actual spacecraft life, and contamination was characterized by changes in surface properties. With the exception of the change in emittance of one sample, all measurable changes in surface properties resulted in acceptable end of life characteristics. Charged spacecraft samples were benignly and consistently reduced to ground potential during exposure to the powered arcjet plume, suggesting that the arcjet could act as a charge control device on spacecraft. Steady state EMI signatures obtained using two different power processing units were similar to emissions measured in a previous test. Emissions measured in UHF, S, C, Ku and Ka bands obtained a null result which verified previous work in the UHF, S, and C bands. Characteristics of conducted and radiated transient emissions appear within standard spacecraft susceptibility criteria. Author

MISSION NEEDS AND SYSTEM COMMONALITY FOR SPACE NUCLEAR POWER AND PROPULSION
David Buden, Anthony Zuppero, and Lawrence Redd (Department of Energy, Idaho Falls, ID.) 1993 7 p Presented at the 28th Intersociety Energy Conversion Engineering Conference, Atlanta, GA, 8-13 Aug. 1993
(Contract DE-AC07-76ID-01570)
(DE93-016557; EGG-M-93191; CONF-930804-11) Avail: CASI HC A02/MF A01

Nuclear power enables or significantly enhances a variety of space missions, whether near-Earth or for solar system exploration, lunar-Mars exploration, or recovery of near-Earth resources. Performance optimizations for individual missions lead to a large number of power and propulsion systems to be developed. However, the realities of the budget and schedules indicate that the number of nuclear systems that will be developed are limited. One needs to seek the 'minimum requirements' to do a job rather than the last ounce of performance, and areas of commonality. To develop a minimum number of systems to meet the overall DoD, NASA, and commercial needs, the broad spectrum of requirements has been examined along with cost drivers. DOE

A system code suitable for analyzing Nuclear Thermal Propulsion (NTP) rocket engines is described in this paper. The code consists of a point reactor model and nodes to describe the fluid dynamics and heat transfer mechanism. Feedback from the fuel coolant, moderator and reflector are allowed for, and the control of the reactor is by motion of control elements (drums or rods). The worth of the control clement and feedback coefficients are predetermined. Separate models for the turbo-pump assembly (TPA) and nozzle are also included. The model to be described in this paper is specific for the Particle Bed Reactor (PBR). An illustrative problem is solved. This problem consists of a PBR operating in a blowdown mode. DOE

Nuclear electric propulsion (NEP) systems are expected to play a significant role in the exploration and exploitation of space. Unlike nuclear thermal propulsion (NTP) systems, NEP systems include electric power generation and conditioning units that in turn are used to drive electric thrusters. These thrusters accelerate subatomic particles to produce thrust. This document provides a quick overview of the technological development needs of NEP systems. Derived from text

ADAPTATIONS TO MICROPEP AND ROCKET TO ALLOW PERFORMANCE EVALUATION OF MULTIPLE GRAIN AND/OR AIRBREATHING MOTORS M.S. Thesis
Aaron M. McAtee Jun. 1993 57 p
(AD-A268798) Avail: CASI HC A04/MF A01

Adaptations to two existing rocket motor performance computer programs were made. MICROPEP, a FORTRAN program developed by the Naval Air Warfare Center Weapons Division, China Lake, California to evaluate theoretical performance of various propellants in rocket motors, was modified to allow calculation of the effects of non-ideal expansion and mixed shifting equilibrium-frozen composition nozzle flow on performance. In addition, the ability to handle vitiated air heaters, to calculate combustion chamber Mach number, and to calculate stagnation pressure for airbreathing engines was incorporated. ROCKET, an internal ballistics program written by the Lockheed Corporation and modified by the Naval Air Warfare Center Weapons Division, was updated to purge the program of unused code and allow input of performance losses in both the combustor and nozzle flows. ULTRAVIOLET PLUME INSTRUMENT CALIBRATION AND SENSOR ASSESSMENT Interim Report
E. R. Malaret, J. G. Cardon, L. Perez, H. W. Smathers, and D. M. Horan 1 Sep. 1993 116 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A269687; NRL/FR/8105-93-9564) Avail: CASI HC A06

The Ultraviolet Plume Instrument (UVPI) is a calibrated, plume-tracking instrument flown on the Naval Research Laboratory's Low-power Atmospheric Compensation Experiment (LACE) satellite. The UVPI's primary mission was to collect images of rocket plumes in the ultraviolet wavelengths. The purpose of this report is to describe the procedures followed in calibrating the UVPI, to present final instrument response functions for use in subsequent data reduction and analysis, and to provide conversion constants useful for revising data values contained on delivered data tapes and in completed rocket plume reports. SOME PARAMETRIC FLOW ANALYSES OF A PARTICLE BED FUEL ELEMENT
D. Dobranich May 1993 126 p
(Contract DE-AC04-76DP-00789)
(DE93-018440; SAND-93-0529) Avail: CASI HC A07/MF A02

Parametric calculations are performed, using the SAFSIM computer program, to investigate the fluid mechanics and heat transfer performance of a particle bed fuel element. Both steady-state and transient calculations are included, addressing such issues as flow stability, reduced thrust operation, transpiration drag, coolant conductivity enhancement, flow maldistributions, decay heat removal, flow perturbations, and pulse cooling.

The calculations demonstrate the dependence of the predicted results on the modeling assumptions and thus provide guidance as to where further experimental and computational investigations are needed. The calculations also demonstrate that both flow instability and flow maldistribution in the fuel element are important phenomena. Furthermore, results are encouraging that geometric design changes to the element can significantly reduce problems related to these phenomena, allowing improved performance over a wide range of element power densities and flow rates. Such design changes will help to maximize the operational efficiency of space propulsion reactors employing particle bed fuel element technology. Finally, the results demonstrate that SAFSIM is a valuable engineering tool for performing quick and inexpensive parametric simulations addressing complex flow problems. DOE

SHRINKAGE VOID FORMATION AND ITS EFFECT ON FREEZE AND THAW PROCESSES OF LITHIUM AND LITHIUM-FLUORIDE FOR SPACE APPLICATIONS
Jae-Young Yang and M. S. El-Genk 10 Jul. 1991 6 p Prepared for LANL, NM
(Contract W-7405-eng-36)
(DE93-019303; LA-Sub-93-216) Avail: CASI HC A02/MF A01 (US Sales Only)

The effects of shrinkage void forming during freezing of lithium and lithium-fluoride on subsequent thaw processes are investigated using a numerical scheme that is based on a single (solid/liquid) cell approach. Results show that a void forming at the wall appreciably reduces the solid-liquid interface velocity, during both freeze and thaw, and causes a substantial rise in the wall temperature during thaw. However, in the case of Li, the maximum wall temperature was much lower than the melting temperature of PWC-11, which is used as the structure material in the SP-100 system. Hence, it is concluded that a formation of hot spots is unlikely during the startup or restart of the SP-100 system. DOE

ANALYSIS OF FILM COOLING IN ROCKET NOZZLES Final Report
Keith A. Woodbury Sep. 1993 49 p Original contains color illustrations
(Grant NAG8-212)
(NASA-CR-194674; NAS 1.26:194674; BER-596-37) Avail: CASI HC A03/MF A01; 2 functional color pages

This report summarizes the findings on the NASA contract NAG8-212, Task No. 3. The overall project consists of three tasks, all of which have been successfully completed. In addition, some supporting supplemental work, not required by the contract, has been performed and is documented herein. Task 1 involved the modification of the wall functions in the code FDNS (Finite Difference Navier-Stokes) to use a Reynolds Analogy-based method. This task was completed in August, 1992. Task 2 involved the verification of the code against experimentally available data. The data chosen for comparison was from an experiment involving the injection of helium from a wall jet. Results obtained in completing this task also show the sensitivity of the FDNS code to unknown conditions at the injection slot. This task was completed in September, 1992. Task 3 required the computation of the flow of hot exhaust gases through the P&W 40K subscale nozzle. Computations were performed both with and without film coolant injection. This task was completed in July, 1993. The FDNS program tends to overpredict heat fluxes, but, with suitable modeling of backside cooling, may give reasonable wall temperature predictions. For film cooling in the P&W 40K calorimeter subscale nozzle, the average wall temperature is reduced from 1750R to about 1050R by the film cooling. The average wall heat flux is reduced by a factor of 3. Author (revised)

RATIONALE FOR THE POWER STANDARD
Nov. 1992 72 p
(ESA-PSS-02-10-Vol-2-Issue-1; ETN-93-94882) Copyright Avail: CASI HC A04/MF A01

The Power Standard defines the requirements on electrical power systems to be applied by contractors and subcontractors to ESA spacecraft and associated equipment or payloads. The Power Standard consists of two volumes, which support two guideline specifications. This document, volume 2, a reference document, is called the Power standard Rationale (PR); it serves as a guide for volume 1 by explaining the rationale of the requirements specified in volume 1. Volume 1, the standard itself, is called Power Standard (PS). The guidelines for the establishment of a power supply subsystem specification and the guidelines for the establishment of an electrical unit specification are given. ESA

The objective of Phase I of this research effort was to develop an advanced mathematical-empirical model of SSME steady-state performance. Task 6 of Phase I is to develop component specific modification strategy for baseline case influence coefficient matrices. This report describes the background of SSME performance characteristics and provides a description of the control variable basis of three different gains models. The procedure used to establish influence coefficients for each of these three models is also described. Gains model analysis results are compared to Rocketdyne's power balance model (PBM). ANALYSIS OF PULTRUSION PROCESSING FOR LONG FIBER REINFORCED THERMOPLASTIC COMPOSITE SYSTEM
W. Tso, T. H. Hou, and S. N. Tiwari Nov. 1993 82 p
(Grant NAG1-363)
(NASA-CR-194504; NAS 1.26:194504; ODU/ICAM-93-103) Avail: CASI HC A05/MF A01

Pultrusion is one of the composite processing technology, commonly recognized as a simple and cost-effective means for the manufacturing of fiber-reinforced, resin matrix composite parts with different regular geometries. Previously, because the majority of the pultruded composite parts were made of thermosetting resin matrix, emphasis of the analysis on the process has been on the conservation of energy from various sources, such as heat conduction and the curing kinetics of the resin system. Analysis on the flow aspect of the process was almost absent in the literature for thermosetting process. With the increasing uses of thermoplastic materials, it is desirable to obtain the detailed velocity and pressure profiles inside the pultrusion die. Using a modified Darcy's law for flow through porous media, closed form analytical solutions for the velocity and pressure distributions inside the pultrusion die are obtained for the first time. This enables us to estimate the magnitude of viscous dissipation and it's effects on the pultruded parts. Pulling forces refined in the pultrusion processing are also analyzed. The analytical model derived in this study can be used to advance our knowledge and control of the pultrusion process for fiber reinforced thermoplastic composite parts. Author

METAL-NANOCLUSTER COMPOSITES MADE BY ION IMPLANTATION: A NOVEL THIRD-ORDER NONLINEAR MATERIAL
R. F. Haglund, Jr., L. Yang, R. H. Magruder, III, K. Becker, J. E. Wittig, C. W. White, R. A. Zhur, L. Yang, R. Dorsinville, and R. Alfano Mar. 1993 13 p Presented at the OE/LASE 1993 International Society for Optical Engineering Conference, Los Angeles, CA, 16-23 Jan. 1993
(Contract DE-AC05-84OR-21400)
(DE93-015908; CONF-930159-38) Avail: CASI HC A03/MF A01

We describe our recent studies of metal-insulator nanocluster composites made by ion implantation in such substrates as glass and sapphire. The metal clusters have diameters ranging from 3 to 30 nm. The composites exhibit an electronic nonlinear optical response which is fast on the picosecond time scale. In addition to possibilities for technological application, these materials also offer a way of studying unusual properties of composite materials, such as the quantum confinement of conduction-band electrons and the transverse relaxation time T(sub 2) as a function of cluster size. The full potential of composite materials has not yet been realized. This is due to lack of fundamental understanding and a lack of confidence in material behavior, particularly for primary structural applications. Innovative design tools are required to make more efficient use of composites for future primary structural components. This is an essential goal for industry to ensure competitive position in the next generation of advanced structures and components. The objective of this literature study is to examine the analytical and numerical predictive methods for the strength of a cracked fiber reinforced plastic composite. Especially, methods based on fracture mechanics are studied. Due to the fracture behavior of composites the problem is very complicated. Most of the work reported in literature has been done to assess the effect of delaminations on the behavior of a fiber reinforced composite. This creates the basis for the more general predictive methods for strength and lifetime. Also, some similarity can be seen with the analyses of glued joints. The special techniques required to numerically determine the effect of a delamination on the strength of a fiber reinforced composite laminate are also discussed. ESA

IMPACT RESPONSE OF COMPOSITE LAMINATES: A GUIDE TO CLOSED FORM SOLUTIONS
Robin Olsson Jan. 1993 106 p Sponsored by Foersvarets Materialverk, Stockholm, Sweden Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(FFA-TN-1992-33; ETN-93-94859) Avail: CASI HC A06

A guide to the use of available closed form solutions for the analysis of the impact response of laminated composite plates is presented. Responses mainly governed by wave propagation and by conditions of fixed boundaries are discussed and criteria are given for determining the type of response to be considered. Contact conditions and their influence on the type of response are dicussed. Methods to analyze the large local stresses close to the point of impact are described and applied to predict initiation and size of damage observed in a number of published experimental studies. More special topics such as sandwich plates, dynamical material data, and a number of application examples of impacts occurring in practice are also covered. ESA

PROCESS FOR PREPARING THERMOPLASTIC COMPOSITES Patent
Roland C. Cochran, inventor (to Navy) and Edwin L. Rosenzweig, inventor (to Navy) 17 Aug. 1993 11 p Filed 2 Mar. 1992
(AD-D015864; US-Patent-5,236,646; US-Patent-Appl-SN-844276) Avail: CASI HC A02/MF A01

This invention relates to a process for preparing thermoplastic composites, i.e., laminates from a plurality of individual plies of thermoplastic resin prepregs. The prepregs are formed into composites under two substantially concentric vacuum chambers. High temperatures and low consolidating pressures are applied against the prepregs in an inner vacuum chamber while a lower vacuum is drawn from the rigid outer chamber to remove the volatiles and consolidate the prepregs. DTIC

LIGHTWEIGHT MATERIALS FOR TRANSPORTATION: PROGRAM PLAN
1993 107 p
(Contract DE-AC05-84OR-21400)
(DE93-017381; ORNL/ATD-75) Avail: CASI HC A06/MF A02

This program plan has been prepared by the Office of Transportation Materials in response to a request by the House Committee on Appropriations. It recognizes that a significant commitment to long-term, stable materials research and development (R&D) is required to realize the benefits of lighter weight vehicles, including economic, environmental, and energy related benefits. Extensive input was obtained from the major US automakers and from representative materials and component suppliers. Considerable interaction with the key members of the US Automotive Materials Partnership (USAMP) has ensured consistency of technical direction. The program will support R&D activity at industrial sites through competitively bid subcontracts with cost sharing anticipated at 30-50%, with the higher amounts in process scale-up and manufacturing technology development. The recommended LWM Program will enable industry to develop necessary technology by utilizing their capabilities as well as accessing supporting technology at national laboratories, universities, and ongoing program activity at NASA, DoD, DOT, NIST, etc., and thereby leverage industry resources through integrated team approaches. Many individual program efforts are currently in place that address small portions of the overall needs of the LWM Program, both within DOE and in other agencies. Cognizance of these and overall integration of research activities are planned as significant program management tasks. Because of the international nature of the automobile business, benchmarking of foreign technology and tracking of worldwide developments are also key program elements. DOE

SAND CONTACT IN DYNA3D
R. G. Whirley and B. E. Engelmann 25 Aug. 1992 15 p Presented at the DYNA3D User's Group Conference, Manchester, England, 22-23 Sep. 1992
(Contract W-7405-eng-48)
(DE93-016451; UCRL-JC-111560; CONF-9209372-1) Avail: CASI HC A03/MF A01

This paper describes some recent developments in adaptive contact algorithms for the transient analysis of penetration and material failure in DYNA3D. A failure criterion is defined for volumes of potentially failing material on each side of a contact surface. As material within an element fails, the element is deleted from the calculation, and the contact surface is adaptively redefined to include the newly exposed outer material boundary. This algorithm admits arbitrary combinations of shell and solid elements to allow modeling of composite or honeycomb structures. The algorithms and their efficiency are illustrated with several DYNA3D simulations, and results are compared with experimental data. DOE

STRENGTH OPTIMIZATION OF C/Al METAL MATRIX COMPOSITES PRODUCED FROM PREPREGS Ph.D. Thesis - Duisburg Univ. [FESTIGKEITSOPTIMIERUNG AUS PREPREGS HERGESTELLTER KOHLENSTOFFASERVERSTAERKTER ALUMINIUMMATRIX-VERBUNDWERKSTOFFE]
Jean-Jacques Masson Dec. 1992 110 p In GERMAN
(DLR-FB-92-39; ETN-93-94871) Avail: CASI HC A06/MF A02

Long fiber reinforced C/Al composites manufactured from prepregs are considered. The consolidation of the composite material was performed by hot pressing in vacuum. It is found that the formation of aluminum-carbide crystals at the fiber/matrix interface during composite processing is detrimental to fiber strength. In order to determine the degradation of fiber strength, single Al coated fibers were tested after annealing treatments corresponding to normal processing conditions. The strength distributions could not well be described by the Weibull theory and a new model was applied, which is based on a description of the populations of defects in a fiber. On the basis of the results of the fiber investigations, strength of the composite was optimized by choosing appropriate processing parameters. A model is presented to predict composite strength from strength distributions obtained from single fibers. The four parameters of elasticity of unidirectional laminates could be estimated on the basis of simple micromechanical models. ESA

EQUIPMENT FOR INVESTIGATION OF CRYOGENIC COMPACTION OF NANOSIZE SILICON NITRIDE POWDERS
Wei Chen, G. J. Piermarini, S. J. Dapkunas, S. G. Malghan, and A. Pechenik (Air Force Office of Scientific Research, Bolling AFB, Washington, DC.) 1992 10 p
(Contract DE-AI05-92OR-22041)
(DE93-018740; DOE/OR-22041/1) Avail: CASI HC A02/MF A01

A system for studies of time-dependent compaction of nanosize silicon nitride powders under various atmospheres at 77 to 1000 K is described. The system incorporates a screw-driven press (10 ton capacity) with a piston-cylinder type die and can produce cylindrical powder compacts, 3 mm dia and about 1 mm thick, using pressures up to 3 GPa. The system is computer-controlled and permits accurate measurements of the sample volume, and, after appropriate calibration, can determine the rate and degree of densification of the compacting powder as pressure is applied. Frictional forces between the piston and the die are measured during the compaction process. For calibration of the system, powders with known volume-change accompanied by phase transition under pressure were studied, and good agreement with published results was demonstrated. Several Si3N4 samples were compacted and sintered at 1300 to 1600 C. Max random packing density of 64% was obtained using liquid nitrogen lubricant at pressure less than 2.5 GPa. Both green samples and samples sintered at temperatures to 1500 C were transparent. DOE

EVALUATION OF THE PRODUCTION-GRADE CLASS 4 FLEXTENSIONAL TRANSDUCER SHELL Final Report
J. D. Maltby Apr. 1993 47 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A268796; NCCOSC-TR-1604) Avail: CASI HC A03

This report evaluates physical characteristics and mechanical properties of the production-grade composite Class 4 flextensional transducer shell produced by Brunswick Defense. The void content was very low; the average was less than 0.5%. The fiber distribution was very uniform throughout the shell; the average fiber volume was 52%. Interlaminar shear strength averaged 11.4 ksi. The shear modulus was very nonlinear. Its initial value was 0.52 Mpsi. Through-the-thickness strength averaged 6.7 ksi in tension and 24.4 ksi in compression. Through-the-thickness test results revealed a nonlinear modulus in compression and a fairly linear modulus in tension. DTIC

(Grant AF-AFOSR-0172-90)
(AD-A268809; AFOSR-93-0664TR) Avail: CASI HC A05

This final technical report summarizes the activities, accomplishment, and research results obtained under the research grant AFOSR-90-0712, which covered the period from 15 Feb. 1990 to 30 Apr. 1993. The main objective of the research is to study the physical mechanisms of matrix microcracking which constitutes the fundamental cause for the toughness and strength properties in fiber-reinforced ceramic-matrix composites. Major results summarized in this report include the following: (1) fabrication of the test specimens with controlled microstructural variables; (2) laboratory tests of matrix microcracking with in-situ and real-time monitoring; and (3) formulation of a simulation model and modeling results. A list of publications that have resulted from this research is included in this report. DTIC

A diverse group from Europe and the U.S. were brought together to address broad aspects of composite systems, ranging from processing to design and including novel concepts. One objective was to compare and contrast approaches used for polymer-based systems with those for metal and ceramic systems. Another was to assess opportunities for new initiatives. A third was to explore concurrent engineering issues. Various generalizations can be made based on the presentations and discussions on the following: delamination and large scale bridging, remaining life, deformation and creep, crack growth micromeasurements, and novel approaches. PROCESS RELATIONSHIP AS INFLUENCED BY CARBONIZATION RATE Extended Abstract
Kristen M. Kliner, David P. Anderson, and Timothy D. Naughton Jun. 1993 5 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AF Proj. 2864)
(AD-A269680) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The typical process cycle for a carbon-carbon composite begins with an organic matrix impregnated fibrous preform cured according to conventional composite practices (e.g., lay-up, bagging and autoclave cure; hot pressing; etc.). This cured composite is then subjected to a pyrolysis cycle in the absence of oxygen which results in the carbonization of the matrix. Carbonization cycles are carried out to temperatures of 650-800 C for several hours or even days. During these cycles as much as 50% of the matrix mix can be volatilized with simultaneous shrinkage and microcracking. The resultant porous, low density carbonaceous solid is usually densified by additional matrix impregnation and heat treatment steps. The extreme length of the carbonization process is due to the heating cycle development methodology. The development of the material properties was not understood, so to keep catastrophic defects from occurring, the heating cycle was made very low. To intelligently control the process, the materials process/property relationship must be understood. In this study the relationship between heating rate and physical development of the carbonization of a phenolic preform was investigated. DTIC

THE 6TH JAPAN-U.S. CONFERENCE ON COMPOSITE MATERIALS Final Report, 1 Sep. 1991 - 31 Aug. 1992
K. L. Reifsnider Mar. 1993 877 p Conference held in Orlando, FL, 22-24 Jun. 1992 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0330-91)
(AD-A268535; AFOSR-93-0620TR) Avail: CASI HC A99

This conference has achieved its goal of updating the research and development community about recent advances in the area of modern composite materials, and about interactions and opportunities associated with US-Japan Cooperation. The conference was organized and administered by the US-Japan Council for Composite Materials, with financial backing from the Virginia Institute for Materials Systems, which is part of Virginia Tech. Cooperating organizations include the American Society for Composites, American Society of Mechanical Engineers, Ohio Aeronautics Institute, and the Society of Engineering Mechanics. The scope of the Conference included all types of high performance composite systems, interfaces and interphases, high temperature materials, smart materials and structures, fracture, fatigue, and damage analysis. Specific topic areas include: Materials System Design, Manufacturing and Processing. Fabrication of Components, Interfaces and Interphases, Woven and n-Dimensional Materials, High Temperature Materials, Stress Analysis and Micromechanics. The conference lasted for three days with 120 papers presented (40 from Japan and 80 from the US). The papers presented at the conference were relevant for the current Air Force technology thrusts such as the Integrated High Performance Turbine Engine Program and the National Aerospace Plane. DEVELOPING AND UNDERSTANDING THE HIGH TEMPERATURE BEHAVIOR OF NIOBIUM ALUMINIDES AND NIOBIUM ALUMINIDE COMPOSITES Final Report, 1 Dec. 1989 - 31 May 1993
Juan M. Sanchez Jun. 1993 30 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0070-90)
(AD-A268874; AFOSR-93-0627TR) Avail: CASI HC A03

The present three year study has sought to understand the potential for, and limitations to, development of high temperature structural materials based on niobium aluminide and transition metal beryllide intermetallic compounds. Beginning with a broad examination of some important properties, this project has identified promising areas for research and culminates with significant additions to the body of knowledge on both of these classes of materials. During the first two years of this program, significant effort was concentrated on securing a source and establishing processing routes for the materials under consideration. This was necessarily accompanied by the development and use of scoping techniques for initial characterization of the candidate materials and processes. Such techniques need to be rapid and informative tests which are forgiving of sample imperfections, so that a few parameters of interest of a large number of sample materials can be easily compared. In this study the techniques based upon high temperature micro-indentation were chosen to rank the various static and time-dependent mechanical properties, and scanning electron microscopy (SEM) with energy dispersive spectroscopy (EDS) was used for microstructural and chemical evaluation. FATIGUE RESISTANT Ti3Al COMPOSITES Final Report, 28 Sep. 1990 - 27 Sep. 1992
D. B. Marshall, M. C. Shaw, M. R. James, J. Graves, and W. L. Morris Jan. 1993 93 p
(Contract F33615-90-C-5928)
(AD-A270305; SC71034.FRD; WL-TR-93-4034) Avail: CASI HC A05/MF A01

Measurements of interfacial properties and residual stresses in Ti3 Al/SiC composites with and without ductile Ag/Ta layers are presented as the first step in determining the role of the ductile layers in the fatigue of these composites. In the composite without ductile layers, debonding and fiber sliding occurred along the interface between the outer surface of the fiber and the layer of reaction products. In the composite with Ag/Ta layers, debonding and sliding occurred within the SCS-6 layers that form the outer part of the fiber, with a higher frictional stress resisting sliding (100 MPa c.f. 66 MPa). Fatigue crack growth measurements indicated only minor differences in growth rates in the two composites in a given environment, but both composites exhibited much larger growth rates in air than in vacuum. High resolution crack opening displacement measurements are used to assess relative bridging effects. To avoid the limitation imposed by the presence of weak SCS-6 layers on the SiC fibers, a composite composed of sapphire fibers in matrix of Ti3Al with an interfacial layer of Ta was fabricated. In situ observations during transverse loading indicated that the interfacial bonding was sufficiently strong that interfacial debonding or plasticity did not affect transverse properties. DTIC

DEVELOPMENT OF A FINITE ELEMENT METHOD PROGRAM FOR THE ANALYSIS OF LAMINATED COMPOSITE PLATES USING FIRST-ORDER SHEAR DEFORMATION THEORY M.S. Thesis
Brett A. Pauer Aug. 1993 137 p
(AD-A270318; AFIT/CI/CIA-93-146) Avail: CASI HC A07/MF A02

A finite element computer program for determining the deflection and stresses in general laminated composite plates was developed. The program is based on first-order shear deformation theory of laminated plates with small deflections. The program includes the flexibility to impose general boundary conditions, has three different quadrilateral elements, and is able to analyze both static and dynamic plate problems. The program code tested favorably against results from other analytical methods and literature sources. The results from this program demonstrate the need to include shear deformation in the analysis of composite plates. DTIC

MECHANICAL PROPERTIES AND IMPACT DAMAGE RESISTANCE OF COMPOSITES FABRICATED BY LOW COST, VACUUM ASSISTED, RESIN TRANSFER MOLDING
Thomas Juska, J. S. Mayes, and William H. Seemann, III Aug. 1993 64 p
(AD-A270361; CDNSWC/SSM-64-93/04) Avail: CASI HC A04/MF A01

Fabric-reinforced laminates made by SCRIMP (Seemann Composites Resin Infusion Molding Process) were tested in compression, tension, flexure, short beam shear, and impact. A global study of the properties of SCRIMP panels was the goal of this program. Four vinyl esters, one polyester, and two epoxies were tested, as were seven different styles of E-glass fabric. The properties of E-glass fabrics were compared with those of carbon, Kevlar, and Spectra fabrics, and with the hybrids E-glass:carbon, E-glass:Kevlar, and E-glass:Spectra. Composite properties increased with resin modulus, provided the resin failure strain was above a critical (undetermined) minimum value. Light woven roving and textile fabrics had somewhat better properties than coarser woven rovings, and glass was the overall best performer based on cost, strength, and impact resistance. An E-glass:Kevlar hybrid was identified which had significant weight savings but comparable properties to E-glass. DTIC

WETTABILITY AND REACTION KINETICS IN METAL MATRIX COMPOSITES Annual Report
Glen R. Edwards and David L. Olson Aug. 1993 59 p
(Contract N00014-92-J-1389)
(AD-A270377; MT-CWR-093-019) Avail: CASI HC A04/MF A01

Research accomplishment during the last academic year are in two related areas: (1) further applications of the thermodynamic model developed in the previous years, and (2) kinetic studies in alumina/reactive metal systems. The ongoing projects are adaptations of the research findings from the previous years, aimed at improving the wettability at an aluminum/alumina interface and understanding the nature of the oxide barrier formed at the ceramic/liquid aluminum interface. JOINING AND ADHESION OF ADVANCED INORGANIC MATERIALS SYMPOSIUM
A. H. Carim (Pennsylvania State Univ., University Park.), D. S. Schwartz (McDonnell-Douglas Corp., Saint Louis, MO.), and R. S. Silberglitt (FM Technologies, Inc., Fairfax, VA.) 14 Apr. 1993 248 p Symposium held in San Francisco, CA, 12-14 Apr. 1993
(Contract N00014-93-I-0299)
(AD-A269748) Avail: CASI HC A11/MF A03

This volume is a record of the first Joining and Adhesion of Advanced Inorganic Materials Symposium, held on April 12-14 at the 1993 MRS Spring Meeting in San Francisco, California. We brought together for this symposium an international group of researchers working in every aspect of materials joining and adhesion, from fundamental theoretical aspects of adhesion to joining techniques being applied in the commercial world. Adhesion of thin films and coatings was discussed at the atomic/electronic level, as well as on the practical level of coatings for wear resistance. Joining of a broad range of materials was discussed, including ceramics and ceramic matrix composites, metals and metal matrix composites, and semiconductors. A variety of novel joining techniques were described, many of which are destined to become commercially important technologies in the near future. DTIC

OPTICAL PROPERTIES OF REDISPERSED IRON FIBERS MEASURED AT 94 GHz Final Report
C. W. Bruce, A. V. Jelinek, and P. A. Silva Aug. 1993 23 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A269739; ARL-TR-59) Avail: CASI HC A03

Millimeter wavelength attenuative properties of iron fibers produced by the high temperature reduction of iron carbonyl were measured in both controlled and field environments. Aerosol morphology was evaluated statistically for the controlled studies, and results were used as a basis for calculations of the absorption efficiency. Scattering efficiency for such small diameter fibers can be assumed to be a negligible proportion of the net attenuation. Reasonable agreement between measurements and theory is indicated. Efficiencies remain relatively high for visible wavelengths. DTIC

EFFICIENCY OF FIBER DISPERSION Final Report
C. W. Bruce, Mike J. Thurston, and A. V. Jelinek Jul. 1993 25 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A269740; ARL-TR-56) Avail: CASI HC A03

Net efficiencies for the dissemination of graphitic fibers are determined for two continuous processes (fibers cut as part of the dispersion process or precut). In both cases an extensive grid of passive dosimetric samplers inset with a coarser grid of time resolved aerosol density samplers provided an absolute time average dosage profile, which was integrated over space to give the total effective airborne aerosol mass. The efficiency is expressed as a ratio of the airborne mass to the total mass dispersed from the bulk. For lower dosages corresponding to a dispersed mass of less than 1 lb, use of the passive, high spatial resolution grid gave efficiencies at about the 50-percent level with no large deviations from the mean. At larger dosages, for which the total mass dispersed ranged from about 1 lb to about 50 lb, only the values obtained using coarser grid (3 x 3 instruments) were valid. In the latter case the variation in efficiency was much larger, but the average indicates at least the same level of efficiency. Dispersion rates varied from 1 lb/minute to 10 lb/minute. DTIC

NONDESTRUCTIVE INSPECTION OF GRAPHITE-EPOXY LAMINATES FOR HEAT DAMAGE USING DRIFT AND LPF SPECTROSCOPIES

G. L. Aowell, N. R. Smyrl, C. J. Janke (Oak Ridge National Lab., TN.), E. A. Wachter (Oak Ridge National Lab., TN.), W. G. Fisher, J. Lucania (Harrick Scientific, Inc., Ossining, NY.), M. Milosevic (Spectra-Tech, Inc., Stamford, CT.), and G. Auth (MIDAC Corp., Cosa Mesa, CA.) 3 Jun. 1993 18 p Presented at the Conference on Characterization and NDE of Heat Damage in Graphite Epoxy Composites, Austin, TX, 27-28 Apr. 1993

(Contract DE-AC05-84OS-21400)

(DE93-017228; Y/DZ-1008/R1; CONF-9304170-1) Avail: CASI HC A03/MF A01

The effect of heat damage on polymer matrix composites (PMC) used in aircraft structures presents a unique problem for nondestructive testing (ND) in that damage may result as a combination of thermally cycling the PMC above the glass transition temperature of the polymer and oxidative degradation of the polymer or the polymer-fiber interface. The usual techniques for the detection of voids and flaws by radiographic, ultrasonic, and thermal imaging techniques play an important role in this ND problem. However, heat damage may result in loss of strength in these materials without producing physical flaws (cracks and delaminations) big enough to be detected. Diffuse reflectance Fourier transform infrared (DRIFT) and laser pumped fluorescence (LPF) measurements previously obtained on IM6/3501-6 laminate panels were re-evaluated to improve these techniques for the nondestructive inspection of aircraft. A more robust algorithm for relating flexural strength to changes in DRIFT spectra related to oxidation is presented and used to interpret previously reported evacuable cell DRIFT measurements. Recent advances in DRIFT technology are described which include an evacuable cell with a hemispherical window for oxidation kinetics studies, and the development of a portable DRIFT spectrometer that was used to make measurements on an aircraft. The use of a 633-nm helium-neon laser for LPF is reported as a means for rapidly relating both fluorescence intensity and spectral distribution to flexural strength. DOE

MECHANICAL-PROPERTY CHANGES OF STRUCTURAL COMPOSITE MATERIALS AFTER LOW-TEMPERATURE PROTON IRRADIATION: IMPLICATIONS FOR USE IN SSC MAGNET SYSTEMS

J. Morena (Ace, Inc., Stuart, FL.), C. L. Snead, Jr., C. Czajkowski (Superconducting Super Collider Lab., Dallas, TX.), and J. Skaritka (Superconducting Super Collider Lab., Dallas, TX.) 1993 4 p Presented at the 5th Annual International Industrial Symposium on the Super Collider and Exhibition, San Francisco, CA, 6-8 May 1993

(Contract DE-AC02-76CH-00016)

(DE93-016735; BNL-49067; CONF-930537-84) Avail: CASI HC A01/MF A01

Longterm physical, mechanical, electrical, and other properties of advanced composites, plastics, and other polymer materials are greatly affected by high-energy proton, neutron, electron, and gamma radiation. The effects of high-energy particles on materials is a critical design parameter to consider when choosing polymeric structural, nonstructural, and elastomeric matrix resin systems. Polymer materials used for filled resins, laminates, seals, gaskets, coatings, insulation, and other nonmetallic components must be chosen carefully, and reference data viewed with caution. Most reference data collected in the high-energy physics community to date reflects material property degradation using other than proton irradiations. In most instances, the data were collected for room-temperature irradiations, not 4.2 K or other cryogenic temperatures, and at doses less than 10(exp 8)-10(exp 9) Rad. An energetic proton and the accompanying spallation-product particles provide good simulation fidelity to the expected radiation fields predicted for the cold-mass regions of the SSC magnets, especially the corrector magnets. Results are presented for some structural composite materials which were part of a larger irradiation-characterization of polymeric materials for SSC applications. DOE

CHARACTERIZATION OF VAPOR PLUME SPECIES AND DEPOSITION RESIDUES RESULTING FROM PULSED LASER ABLATION OF A GRAPHITE/EPOXY COMPOSITE Final Report, Jun. 1992 - Jan. 1993

Robert E. Roybal, Charles J. Miglionico, Charles Stein, Larry E. Murr (Texas Univ., El Paso.), and Kenneth A. Lincoln (Eloret Corp., Moffett Field, CA.) Aug. 1993 30 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(AD-A270101; AD-E201625; PL-TR-92-1075) Avail: CASI HC A03

A modified time-of-flight mass spectrometer (TOFMS) fitted with a special collection stage for carbon-coated transmission electron microscope specimen grids is used to monitor laser-pulse ablation products from graphite/epoxy composite targets. Scanning electron microscopy observations show ablation damage to consist of matrix pyrolysis, fiber fracture, and spallation of fragments which include elemental hydrogen, carbon epoxide, and acetylene groups. Transmission electron microscope examination of specimen grids showed a variety of crystals and polycrystalline hexagonal graphites having a wide range of shapes including spheres and faceted polyhedra and platelets, textured flake structures, and microrosettes. These observations lend some credibility to a model for laser-shock and pyrolysis effects which creates molecular plume fragments and deposition fragments of hexagonal graphite. DTIC

A NUMERICAL ANALYSIS OF CRACK GROWTH IN BRITTLE MICROCRACKING COMPOSITES

S. B. Biner 1993 23 p Presented at the Mechanism and Mechanics of Composite Fracture Meeting, Pittsburgh, PA, 17-21 Oct. 1993

(Contract W-7405-eng-82)

(DE93-011562; IS-M-747; CONF-931078-1) Avail: CASI HC A03/MF A01

A set of numerical analyses of crack growth was performed to elucidate the mechanism of microcracking on the observed fracture behavior of brittle solids and composites. The random nucleation, orientation and size effects of discrete microcracks and resulting interactions are fully accounted for in a hybrid finite element model. The results indicate that the energy expenditure due the microcrack nucleation seems not to contribute significantly to the resistance to crack growth. The main controlling parameter appears to be elastic interaction of the microcracks with the main crack in the absence of a reinforcing phase; therefore, the microcrack density plays an important role. In the case of the composites, the interaction of the main crack with the stress fields of the reinforcing phase, rather than interaction of microcracks, is the controlling parameter for the resistance to the crack growth even in the presence of a large population of microcracks. It will be also shown that the crack branching and crack kinking can readily develop as a result of microcracking. DOE

COMPUTATIONAL MECHANICS OF COMPOSITE MATERIALS

A. C. W. M. Vrouwenvelder 1992 72 p Prepared in cooperation with Technische Univ., Delft, Netherlands

(PB93-195782) Avail: CASI HC A04/MF A01

In the first article of the issue fiber-reinforced concrete is described using a homogenization procedure and the resulting model is applied in a non-linear finite element analysis of a beam loaded by impact. The next level of refinement is the meso-level. At such a scale damage mechanics is commonly used as a vehicle for modelling the degradation processes that take place in the solid. The second article of the issue outlines a model that is rather typical for these approaches. In this case the numerical application will be for a polymer-based composite, but the ideas underlying the approach may be used for any composite material. The latter statement also holds true for the last article, where a micromechanics analysis is carried out of a carbon fiber-reinforced silicium carbide matrix and in which delamination in a chip is simulated. SUBCRITICAL CRACK GROWTH IN CONTINUOUS-FIBER REINFORCED CERAMIC COMPOSITES

C. H. Henager, Jr. and R. H. Jones Jun. 1993 13 p Presented at the 95th Annual Meeting of the American Ceramic Society, Cincinnati, OH, 18-22 Apr. 1993

(Contract DE-AC06-76RL-01830)
(DE93-018784; PNL-SA-22777; CONF-930438-28) Avail: CASI HC A03/MF A01

Time-dependent crack growth measurements of ceramic composites in varying PO2 environments were conducted on materials consisting of chemical vapor infiltration (CVI) SiC reinforced with Nicalon fibers having C- and BN-interfaces. Crack velocities are determined as a function of applied stress intensity and time for varying O2 levels. Results are presented for crack growth in pure Ar and in Ar plus 2000-, 5000-, 10,000-, and 20,000-ppM O2 atmospheres at 1100 C. A 2D micromechanics model is used to represent the time-dependence of observed fiber bridging events and is able to rationalize the observed phenomena. DOE

DELAMINATION IN COMPOSITE MATERIALS AS OBSERVED USING AN OPTICAL FIBER STRAIN GAGE
Glen E. Sabin 17 May 1993 66 p
(AD-A270803; USNA-TSPR-209) Avail: CASI HC A04/MF A01

Composite materials are used extensively in the air and space industries, where materials of high strength and light weight are required. Unlike metals, these materials often give little or no warning before failing - a potentially fatal characteristic for structural members in aircraft. A common mode of failure in composites is delamination, in which the layers of the material separate from each other. Delamination can be caused by impact, longitudinal shear stress between the layers, or transverse tensile stress across the layers. Optical fibers embedded in the composite material provide a means of monitoring the strains which lead to such failures. This project involves the use of an optical fiber strain gage in the configuration of a Michelson interferometer to study a composite sample that experiences transverse tensile stress resulting in delamination. The transverse tensile stress is produced by straightening out an already curved specimen of composite material. The output signal of the interferometer represents the integrated strain over the length of the optical fibers. By embedding the fibers in a composite specimen, the strain experienced in the material can be measured. This signal is recorded on a common audio tape, transferred to a computer, and analyzed quantitatively. DTIC

RESIDUAL STRENGTH PREDICTIONS FOR FIBRE METAL LAMINATES: THE R-CURVES APPROACH
C. A. J. R. Vermeeren Apr. 1993 97 p Sponsored by Structural Laminates Co.
(LR-717; ETN-93-95025) Avail: CASI HC A05/MF A02

The purpose of this study is to investigate whether the R curve method is applicable for the prediction of the residual strength of unstiffened GLARE 2, GLARE 3, GLARE 4 and ARALL 2 laminates. Comparisons were made with 2024-T3 aluminum alloy. The R curve determination practice itself is discussed with respect to its applicability on fiber metal laminates. Center Cracked Tension (CCT) specimens were tested after which it was found that an invariant R curve could be generated for each investigated laminate. Plastic zone sizes of the reference material 2024-T3 aluminum alloy are well predicted by the Irwin plastic zone size correction. In spite of the fact that the plastic zone size in ARALL 2 and GLARE 2 is not entirely equal to the plastic zone size correction used in the R curve method, also for these materials a more or less invariant R curve could be found. Mathematical expressions for R curves of fiber metal laminates are given with which predictions can be made for specimens of an arbitrary width and initial crack size. ESA

DAMAGE ACCUMULATION IN ADVANCED METAL MATRIX COMPOSITES UNDER THERMAL CYCLING/CREEP LOADINGS Annual Technical Report, 15 Jul. 1992 - 14 Jul. 1993
M. Taya, M. S. Lui, W. D. Armstrong, and M. L. Dunn 1 Sep. 1993 25 p
(Contract F49620-92-J-0367)
(AD-A271207; AFOSR-93-0784TR) Avail: CASI HC A03/MF A01

Both experimental and analytical studies were conducted during the first year with the aim of identifying the damage accumulation process in a metal matrix Composite (MMC) subjected to combined creep and thermal cycling loadings. The main achievements in the experimental study are: completion of a new thermal cycler with constant stress loading capability, preliminary data of dimensional change of SiCp/6061 Al matrix composite and R-Curve behavior of PSZ-SS/PSZ composite – PSZ laminate. Whereas the first year analytical study includes construction of dislocation Punching model from ceramic/metal interfaces, a construction of analytical modeling of creep strain of a MMC subjected to either creep loading or combined creep/thermal cycling loading where the debonding of the matrix-fiber interface is accounted for. Three-parameter Weibull function is employed in the model to simulate the distribution of the actual interfacial strength. DTIC

MICROSTRUCTURE AND TEXTURE CONTROL OF FATIGUE IN HYDROGEN AND MARINE ENVIRONMENTS Fiscal Year Letter, 1 Oct. 1992 - 30 Sep. 1993
William W. Gerberich 30 Sep. 1993 7 p
(Contract N00014-89-J-1726)
(AD-A271277) Avail: CASI HC A02/MF A01

It is currently not understood how the anisotropic elastic, plastic, and fracture characteristics interact with environment to limit fatigue life in a corrosive medium. This program examines how texture and anisotropic slip character interact with environment in two general classes of BCC iron base and HCP titanium base alloy systems. Selected area electron channeling, transmission electron microscopy, atomic force microscopy, and fracture micromechanic methods are combined to evaluate microstructural effects on environmentally-induced fatigue initiation and growth. In addition, as it is essential to understand the transition from small crack to long crack behavior, additional threshold studies on both Fe-Si and HSLA polycrystals need to be accomplished. In this way, the various stages of nucleation and growth may be combined together for life prediction. The objective is to provide a partial basis for alloy and materials processing design against fatigue in a marine environment. DTIC

NANOFABRICATION BY FOCUSED ION BEAM Final Report, 1 May 1992 - 31 Aug. 1993
John Melngailis and Dimitri A. Antoniadis 28 Sep. 1993 10 p
(Contract DAAL03-92-G-0217)
(AD-A271290; ARO-29631.2-EL) Avail: CASI HC A02/MF A01

Nanometer scale patterning is one of the keys to advances in electronic devices. At present most patterning is done by a multistep lithography process: resist is exposed and developed and the uncovered surface is altered. The focused ion beam may offer simplification of this multistep process. A surface film may be made to grow or dissolve where it has been irradiated. This can be viewed as a new (inorganic) resist process, but in some cases the patterned film may be the desired final structure on the substrate. The problem is that, although examples of such ion sensitive films have been found, they suffer from some drawbacks such as low sensitivity, or poor resolution. One of the aims of the work was to seek new and useful processes and materials. Another direct patterning technique, more ideally suited for ion beams, is direct maskless implantation of dopants in semiconductors. One of the limits of resolution of this technique is the lateral straggle of ions as they penetrate into the substrate. This has important bearing on the ability to fabricate the confined carrier structures in semiconductors needed in the study of quantum effect devices. The other object of the work was to characterize this straggle and to apply focused ion beam implantation to the fabrication of confined carrier structures, in particular the in-plane-gate field effect transistor. The final report provides a summary of the most important results. DTIC

MICROMECHANICS OF INTERFACES IN METAL MATRIX COMPOSITES Fiscal Year 1993 Letter, 1 Oct. 1992 - 30 Sep. 1993
William W. Gerberich 30 Sep. 1993 6 p
(Contract N00014-92-J-1962)
(AD-A271012) Avail: CASI HC A02/MF A01

Defining the role of the interface is critical to understanding mechanical properties of metal matrix composite (MMC) materials. Measurements of interfacial fracture toughness are being conducted to aid in the development of MMC's. The scientific research goals are to develop a better understanding of how nonlinear behavior in the metal matrix and chemical bonding or frictional effects at the bi-material interface combine to provide the interfacial fracture toughness. To accomplish that a number of spectroscopies including Rutherford Backscattering Spectroscopy (RBS) and several fracture mechanics approaches including fiber push-out are being employed. These will provide feedback to current processing conditions utilized in MMC's. The practical application is to assist 3M in the Model Factory program. DTIC

DEVELOPMENT AND EVALUATION OF ALTERNATIVE RADIOANALYTICAL METHODS, INCLUDING MASS SPECTROMETRY FOR MARINE MATERIALS
Jan. 1993 90 p Presented at the Advisory Group Meeting on Development and Evaluation of Alternative Radioanalytical Methods, Including Mass Spectrometry for Marine Materials, Monaco, 6-9 Jun. 1989 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-625117; IAEA-TECDOC-683; CONF-8906428) Avail: CASI HC A05 (US Sales Only)

One, if not the most important, aspect of environmental protection against radioactive contamination is the ability to measure accurately low-levels of radionuclides present in the environment. This is particularly true of the marine environment where improved and more rapid methods of analysis are required to identify the source and radiological impact of anthropogenic inputs to the oceans. More sensitive and rapid analytical methods with smaller analytical errors are required to study the behavior of different radionuclides in the marine environment. Some of these radionuclides serve as useful research tracers that aid in understanding many complex oceanographic processes. With the ever-increasing demand for more accurate data, the IAEA considered it necessary to convene an Advisory Group Meeting to identify those long-lived radionuclides that may be measured by alternative techniques and discuss and evaluate the sensitivity of the analytical methods. The meeting was held at the IAEA Marine Environment Laboratory in Monaco from 6 to 9 June 1989 and was attended by 6 invited participants and several observers. This report from the meeting is divided into two parts. The first contains 5 contributing chapters. In these chapters, the authors have endeavored to explain the principles of each measurement technique, the strengths and weakness of the method as applied to marine sciences, comparative costs and sensitivities, future developments, and topics of interest to the Agency. The reviews and sensitivities were prepared exclusively by the participants on the basis of their own experience and knowledge of the existing literature. The second part of this report is the appendices section in which can be found tables of radionuclides considered in this report and a comparison of sensitivities for different methods of detection. CATALYTIC HYDROCARBON REACTIONS OVER SUPPORTED METALS
J. G. Ekerdt 29 Mar. 1993 3 p
(Contract DE-FG05-86ER-13604)
(DE93-018168; DOE/ER-13604/22) Avail: CASI HC A01/MF A01

During the past year we have completed our characterization of the factors that control the structure of fully oxidized W and Mo on silica and have established that support hydroxyl groups play a central role in dispersing and attaching cations to the support oxide. Work with M(sub 2)(CO)(sub 4)Cp(sub 2)(M(sub 2)=MoMo, WW, MoW) system has been very encouraging and continues to support the notion that it may be possible to control the structure of adsorbed catalysts (in this case generate metal dimers) by use of organometallic precursors. Techniques are being developed necessary to employ XPS as a means to characterize the attachment process and the oxidation state of the cations after various thermal and photolytic reduction steps. FINITE ELEMENT MODELING OF EVAPORATION AND CONDENSATION DURING SOL-GEL FILM AND FIBER FORMATION
P. R. Schunk, A. J. Hurd, C. J. Brinker, and R. R. Rao 1993 11 p
Presented at the 8th International Conference on Finite Elements in Fluids: New Trends and Applications, Barcelona, Spain, 20-24 Sep. 1993
(Contract DE-AC04-76DP-00789)
(DE93-017655; SAND-92-2701C; CONF-9309156-1) Avail: CASI HC A03/MF A01

Free surfaces, multicomponent phase change, volume expansion and compression, and surface tension gradients make for challenging application of the finite element method to sol-gel (ceramic) film and fiber formation. The microstructure of the final product is largely controlled by the competition between the drying, curing, and underlying fluid mechanics of formation. Sol-gel materials are peculiar because they often contain more than one solvent, each solvent differing in volatility and surface tension. Hence, nonuniform evaporation can produce surface tension gradients that dramatically change the meniscus shape. These processes are complicated further by a volume change that accompanies evaporation and condensation, making for shock-like discontinuities in concentration and velocity at the free surface. Computer-aided predictions of film formation by dip coating and of fiber spinning are made for alcohol-water mixtures with one non-volatile species. The Navier-Stokes system is augmented with two convective-diffusion equations to track the concentration of alcohol and water, and an energy equation to monitor temperature changes. The equations are solved in both phases by discretizing them first with the Galerkin/finite element method. The resulting non-linear algebraic equation set is solved with Newton's method. The subdomaining technique is based on elliptic grid generation and is designed to parameterize the moving meniscus. Special treatment of the functional representations of velocity and concentration within the elements lining the free surface are made to accommodate the volume change that accompanies mass exchange between phases. GUIDELINES FOR THE EXPRESSION OF UNCERTAINTIES IN SURFACE CHEMICAL ANALYSIS BY AUGER ELECTRON SPECTROSCOPY (AES) AND X RAY PHOTOELECTRON SPECTROSCOPY (XPS)
P. J. Cumpson and M. P. Seah Apr. 1993 16 p Sponsored by Dept. of Trade and Industry, London, England
(NPL-DMM(A)-99; ETN-93-94884) Copyright Avail: National Physical Laboratory, Teddington, Middlesex, TW11 0LW, United Kingdom

Guidelines for the statements of uncertainty that accompany analytical results from AES (Auger Electron Spectroscopy) and XPS (X-ray Photoelectron) are presented. Recent recommendations are put into context for these spectroscopies to ensure that results are accompanied by the most relevant uncertainty values. A mathematical description of quantification is given and the statement of uncertainties is described. ESA

The theoretical basis of IR/NIR spectroscopy and equipment techniques are addressed. In the NIR range the most important molecular groups in foodstuffs are the C-H, the O-H and the N-H groups. Equipment technology is divided into that of filtering, dispersive and Fourier Transformation (FT) equipment. Filtering equipment measures 6 to 20 narrow ranges of the spectrum. Of these, two to four ranges are used to determine a given component. With dispersive and FT spectrometers either the whole NIR range or the greater part of it is measured. In the analysis either a few spectral points or a few spectral ranges are used in the calculations, which are done using multivariate regression. The advantages of FT-IR/NIR equipment when compared to dispersive equipment are shown and the sample techniques of FT-IR/NIR equipment with samples in various states are studied. The areas of application for IR/NIR technology cover grain, meat and dairy products, pharmaceutical and technochemical products as well as packaging materials. The most important areas of application have thus far been grain or grain based products. The most important goal of the study was to determine the possibility of measuring quality factors using the fast IR/NIR technique. Another goal was to determine which one of the analyzed variables, had the greatest impact on the specific volume and on the aging process of bread. Here, instead of NIR data, measurements from the samples, determined by chemical and physical means, were used. The information gained can be used in planning the baking process. The problem of determining the baking properties of wheat was chosen as test case. The impact of variates measured, on the volume and hardness of bread, were studied using templates deviced with the aid of the UNSCRAMBLER program. Here, instead of NIR spectra, results of grain analysis were used. Virtually all measured characteristics affected the volume of bread, but aging showed no correlation. This range gave no suggestions for practical process planning, as a sufficiently reliable forecast of bread volume would have required more than ten measurements of the grain variates. A study was also undertaken to determine the possibility of replacing malt analysis with NIR techniques. In studies on barley malt, spectral measurements were made from pulverized malts, but part of the analysis dealt with the proper-results because of the insufficient accuracy of the detector in use at the time. SUMMARY REPORT FOR SUPERCRITICAL CARBON DIOXIDE EXTRACTION AND CARBONIZATION OF RESORCINOL-FORMALDEHYDE (RF) FOAMS
R. F. Simandl, D. N. Robinson, and J. D. Brown Mar. 1993 14 p
(Contract DE-AC05-84OS-21400)
(DE93-016924; Y-2461) Avail: CASI HC A03/MF A01

Emulsion-derived resorcinol-formaldehyde (RF) foams supplied by Sandia National Laboratories-California (SNL-California), were successfully extracted at the Oak Ridge Y-12 Plant using supercritical carbon dioxide. One half of the resulting foams were carbonized. Careful study of the extraction process has yielded a predictive model for supercritical extraction of thin RF foams and has resulted in the optimization of the extraction process. Extraction times and costs were minimized. After the initial solvent exchange step, solvents were supercritically extracted from the RF gels in less than 24 h at a cost of less than $0.01 of CO2 per gram of solvent extracted. DOE

EXCHANGE FRONT STABILITY IN PACKED-COLUMN CHROMATOGRAPHY
S. K. Griffiths and R. H. Nilson (Maxwell Labs., Inc., La Jolla, CA.) Apr. 1993 27 p
(Contract DE-AC04-76DR-00789)
(DE93-017526; SAND-93-8503) Avail: CASI HC A03/MF A01

Exchange front deformation in gas-phase chromatography may sometimes impair column performance. Such deformation can arise from column heterogeneities or from the unstable growth of small disturbances inherently present in the flow field. Here we examine the fundamental stability of a planar traveling exchange front subject to a small sinusoidal perturbation in the front position. The analysis includes the disparity between fluid and front velocities characteristic of exchange chromatography, as well as the distinction between fluid velocities ahead of and behind the front resulting from the net sorption of gases. Fluid compressibility is also considered. Disturbance growth rates are computed as a function of the wavelength, fluid viscosity ratio, and normalized front and fluid velocities over a wide range of each parameter. We find that growth rates increase with increasing viscosity ratio, decreasing wavelength, and increasing normalized front and fluid velocities. Conditions of neutral stability are also determined and indicate that fluid compressibility and net desorption tend to destabilize the exchange front. Sample calculations are presented for the problem of hydrogen isotope exchange in a column of palladium powder. DOE

STRUCTURAL STABILITY OF 1100 C HEATED Pd/k DURING ABSORPTION CYCLING IN PROTIUM
I. A. Fisher 12 Mar. 1993 8 p
(Contract DE-AC09-89SR-18035)
(DE93-016270; WSRC-RP-93-401) Avail: CASI HC A02/MF A01

Pd/k is a hydride forming packing material which is used in the Thermal Cycling Absorption Process (TCAP). Palladium is supported on kieselguhr to create a packing material which will provide adequate void space to prevent excessive pressure drops and flow restrictions. The use of unsupported palladium would result in blockage of columns and clogging of filters due to the small particle size of unsupported palladium hydride powder. During pilot scale demonstrations, it was noted that the Pd/k packing material had degraded causing severe flow restrictions within the TCAP column. A solution to the problem involved the heating of Pd/k at 1,100 C to strengthen the packing material, and render it more resistant to breakdown. The 1,100 C heated Pd/k has been shown to be more resistant to mechanical breakdown than the Pd/k prior to heat treatment. Two primary modes of Pd/k particle degradation have been identified: mechanical breakdown caused by particle fluidization and degradation caused by absorption/desorption cycling. Absorption/desorption cycling causes the palladium particles within the packing to expanded and contract upon formation and decomposition of the hydride, respectively. This expansion and contraction causes large localized stresses within the packing material, which if these stresses can not be accommodated within the packing will cause the material to crack and degrade. The purpose of this report is to document the results of the absorption/desorption cycling of 1,100 C heated Pd/k and compare these results to the results obtained from the absorption/desorption cycling of Pd/k which had not been heated at 1,100 C. X RAY ABSORPTION SPECTROSCOPIC STUDIES OF THE ACTIVE SITES OF NICKEL- AND COPPER-CONTAINING METALLOPROTEINS Ph.D. Thesis
G. O. Tan Jun. 1993 248 p
(Contract DE-AC03-76SF-00515)
(DE93-017142; SU-SLAC-420; SLAC/SSRL-0037; SSRL-M-420) Avail: CASI HC A11/MF A03

X-ray absorption spectroscopy (XAS) is a useful tool for obtaining structural and chemical information about the active sites of metalloproteins and metalloenzymes. Information may be obtained from both the edge region and the extended X-ray absorption fine structure (EXAFS) or post-edge region of the K-edge X-ray absorption spectrum of a metal center in a compound. The edge contains information about the valence electronic structure of the atom that absorbs the X-rays. It is possible in some systems to infer the redox state of the metal atom in question, as well as the geometry and nature of ligands connected to it, from the features in the edge in a straightforward manner. The EXAFS modulations, being produced by the backscattering of the ejected photoelectron from the atoms surrounding the metal atom, provide, when analyzed, information about the number and type of neighboring atoms and the distances at which they occur. In this thesis, analysis of both the edge and EXAFS regions has been used to gain information about the active sites of various metalloproteins. The metalloproteins studied were plastocyanin (Pc), laccase, and nickel carbon monoxide dehydrogenase (Ni CODH). Studies of Cu(I)-imidazole compounds, related to the protein hemocyanin, are also reported here. DOE

SPECTRAL RADIANCE MEASUREMENTS ON A BLUFF BODY STABILIZED FLAME: CHARACTERIZATION OF THE IR SIGNATURE
C. Nelsson Dec. 1992 29 p
(PB93-195899; FOA-30694-8.3,3.1) Avail: CASI HC A03/MF A01

Spectral radiance measurements have been performed with an FTIR spectrometer on a bluff body stabilized flame. As a complement, time resolved broad band radiance measurements were made with a radiometer. Spectra with a resolution of 1/cm were obtained in the wavelength region 0.7 - 13 micrometers showing strong band emissions from H2O and CO2. The time resolved measurements showed radiance variations up to 1 kHz. Comparisons between the FTIR and radiometer results were in good agreement. The data will be used in future flame modeling work. FEEST: A METHOD FOR TABULATING EQUATION OF STATE AND OPACITY TABLES
R. H. White Mar. 1993 13 p
(Contract W-7405-eng-48)
(DE93-017965; UCRL-ID-113714) Avail: CASI HC A03/MF A01

The tabulation of equations of state presently used by codes which carry temperature and density as independent variables, provides separate tables for pressure (P) and specific internal energy ((var epsilon)) as functions of the temperature (T) and density ((rho)). Both P and (var epsilon) are determined by bi-quadratic interpolation in tables of P and (var epsilon) values arranged on a rectangular grid in the T-(rho) plane. The system was designed for use on the 709-7094 generation of computers and has been used, essentially unmodified, for approximately twenty years. It has long been recognized that this 'Bi-quadratic Tabulation' system has several drawbacks. In this paper, the authors describe the Free Energy Equations of State Tabulation (FEEST) scheme which is intended to replace the presently used Bi-Quadratic Tabulation. The Bi-quadratic Tabulation, now used, treats opacities ((kappa)) in the same way as P and (var epsilon) expect that (1/T) replaces T as one of the interpolation variables. Since (kappa) may vary inversely with a high (3 to 8) power of T and since bi-quadratic interpolation in (1/T) includes terms only up to T(-2), opacity tables have been large and difficult to produce. MODIFIED AEQUORIN SHOWS INCREASED BIOLUMINESCENCE ACTIVITY Final Report, 15 Mar. 1990 - 31 Jul. 1992
Douglas C. Prasher 18 Aug. 1993 10 p Limited Reproducibility: More than 20% of this document may be affected by poor print and microfiche quality
(Contract N00014-90-J-1704)
(AD-A268774) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Aequorin belongs to a unique class of photoproteins that emit light upon the binding of certain metals, calcium being the principal intracellular activator. This 'reporting function' of the metal-binding is instantaneous and is very easy to quantitate experimentally. The objective of the project was to develop a variety of recombinant forms of aequorin so they can be employed as metal biosensors. Three calcium-binding sites of aequorin were modified to examine their roles in the calcium-dependent luminescence as well as potentially binding other metal ions. Aequorins having Site 2 substitutions unexpectedly produce more light than wild-type aequorin. DTIC

FUNDAMENTAL STUDIES OF THE MECHANISM OF CATALYTIC REACTIONS WITH CATALYSTS EFFECTIVE IN THE GASIFICATION OF CARBON SOLIDS AND THE OXIDATIVE COUPLING OF METHANE
H. Heinemann, G. A. Somorjai, and D. L. Perry Sep. 1992 17 p
(Contract DE-AC03-76SF-00098)
(DE93-015262; LBL-32857) Avail: CASI HC A03/MF A01

Work will continue on the oxidative coupling reaction of methane over ternary oxide catalysts to produce C(sub 2), C(sub 3) and C(sub 4) hydrocarbons and particularly Olefins with high selectivity. The work which has shown that close to 100% selectivity can be obtained has received wide attention and has resulted in collaborative efforts with industry (CRADA) towards the development of a commercial process. An immediate purpose of additional work is to increase the conversion without diminishing the extremely high selectivity of the reaction and also to permit operation at higher space velocity to reduce equipment size. The mechanism of this reaction is not understood and much additional work is needed to explain the role of carbon formation and of water as intermediates in the reaction and to investigate whether carbon oxides are intermediates. It has been found that oxides other than calcium-nickel-potassium oxides can be useful catalysts for this reaction in the presence of steam and at relatively low temperatures and long contact times. Better definition of the class of binary metal oxides is required and better catalyst characterization is needed to ensure reproducibility of catalyst preparation and operational results. Pretreatment of the catalyst should be shortened and higher space velocities must be obtained. Close collaboration with Orion ACT is required to advance the project toward the pilot plant stage. In the area of coal and char catalytic steam gasification, the large volume of data obtained at atmospheric pressure will be extended to operations at higher pressures. DOE

CONVERSION OF ETHANE AND OF PROPANE TO HIGHER OLEFIN HYDROCARBONS
H. Heinemann and G. A. Somorjai Sep. 1992 25 p
(Contract DE-AC03-76SF-00098)
(DE93-015282; LBL-32858) Avail: CASI HC A03/MF A01

It has become apparent during the past few months that results obtained in the oxidative coupling of methane cannot be extended to ethane and propane. Good selectivities and yields for the oxydehydrogenation to olefins can be obtained but production of higher hydrocarbons is small. The present report summarizes results of experiments using zeolite based catalysts and compares these with basic oxide catalysts. The oxydehydrogenation of ethane over zeolite based catalysts (H+-, Na+-, Ni2+-, Pt2+-, Ga3+-, and (V)-ZSM-5) and oxide catalysts (Li/MgO, Ca-Ni-K) was studied in the temperature range 450-600 C. Selectivity to olefins close to 80% was achieved at 550 C. Basic (Na-ZSM-5) and neutral (V-ZSM-5) zeolite catalysts were shown to be more active and selective for the oxydehydrogenation of ethane than oxide catalysts. DOE

SYNTHESIS OF HIGHER ALCOHOLS FROM CARBON MONOXIDE AND HYDROGEN IN A SLURRY REACTOR Ph.D. Thesis

M. S. McCutchen 28 Aug. 1992 113 p
(Contract DE-AC22-90PC-90043)
(DE93-015086; DOE/PC-90043/T9) Avail: CASI HC A06/MF A02

Higher, i.e. C(sub 2+), alcohols are desired as gasoline additives, feedstocks for producing ethers and as alternative fuels for automobiles. In all cases, the backbone branching of an alcohol improves octane rating, which is essential for good engine performance. These types of branched, higher alcohols are the desired products for a process converting synthesis gas, a CO and H2 mixture, often generated from coal gasification. Based on this premise, promoted ZnCr oxide catalysts appear to be as one of the best avenues for further investigation. Once this investigation is complete, a natural extension is to replace the Cr in the ZnCr oxide catalyst with Mo and W, both in the same elemental triad with Cr. Mo has already been shown as an active HAS catalyst, both on a SiO2 support and in the MoS2 form. The three catalyst combinations, ZnMo, ZnW, and MnCr oxides will be tested in the stirred autoclave system. However, if none of the three indicate any comparable activity and/or selectivity toward higher alcohols as compared with other HAS catalysts, then an investigation of the effects of Cs promotion on the ZnCr oxide methanol catalysts will be executed. DOE

EXPERIMENTAL AND THEORETICAL INVESTIGATION OF SURFACE CHEMISTRY INDUCED BY DIRECT AND INDIRECT ELECTRONIC EXCITATION Final Report, 30 Sep. 1991 - 31 Mar. 1993
Peter C. Stair and Eric Weitz Jul. 1993 16 p
(Grant AF-AFOSR-0377-91)
(AD-A268846; AFOSR-93-0655TR) Avail: CASI HC A03/MF A01

There is now a considerable body of work concerned with the UV photochemistry of molecules adsorbed on well characterized metal and to a lesser extent, semiconductor and insulator surfaces. Several detailed review articles have already appeared on this subject. It has become clear that the photochemistry of monolayer adsorbates on surfaces is strongly influenced by a competition between promotion of the molecule to an excited state and quenching of that excited state. Excitation can be driven either by adsorbate or substrate photon absorption, and depending upon the excited state lifetime, a variety of relaxation mechanisms (quenching), may be important. These include radiative processes (fluorescence and phosphorescence), non-radiative processes (energy transfer to the surface or neighboring molecules via excitation of plasmons, phonons, or creation of electron-hole pairs), and chemical reaction. As a result, extensive modification of photochemical behavior has been observed for an adsorbate molecule with respect to its gas phase counterpart. DTIC

ULTRASONIC PROCESS FOR DESTRUCTION OF CHLORINATED ORGANIC COMPOUNDS IN AQUEOUS SOLUTION
Jiann M. Wu and Hann S. Huang 1993 15 p Presented at the 1993 Chinese American Academic and Professional Convention, Chicago, IL, 2-5 Jul. 1993
(Contract W-31-109-eng-38)
(DE93-015551; ANL/ES/CP-79581; CONF-930796-1) Avail: CASI HC A03/MF A01

Laboratory investigations of the ultrasonic process for destruction of low concentrations of carbon tetrachloride (CCl4) into nonhazardous end products were carried out in a bench-scale batch reactor, equipped with a 600-W ultrasonic power supply. Process parameters studied included irradiation time, concentration, steady-state operating temperature, pH, and the intensity of applied ultrasonic-wave energy. High destruction efficiencies of greater than 99% were achieved through this process, and the irradiation time and the intensity of applied energy were identified to be the most important process parameters. The irradiation time required for a given degree of destruction decreased with increasing intensity of the applied ultrasonic energy. In addition, a detailed chemical reaction mechanism for the destruction of CCl4 in water was formulated. The agreement between the model and experimental results is generally good. DOE

APPLICATIONS OF SCANNING TUNNELING MICROSCOPY TO ELECTROCHEMISTRY
Nathan S. Lewis 26 Aug. 1993 3 p
(Contract N00014-92-J-1183)
(AD-A269129) Avail: CASI HC A01/MF A01

Our research during the last contract period involved an evaluation of the efficacy of using partially insulated STM tips as ultramicroelectrodes in studies of heterogeneous electron transfer. We initially fabricated these electrodes to serve as tips for imaging surfaces in solutions that contain significant concentrations of electroactive species. The tips that we have prepared (by partially coating etched Pt wire with molten glass) can have diameters as small as a few nanometers, and, by the nature of their small size, are useful in examining fundamental quantities such as the heterogeneous electron transfer rate constant for redox species. PROTON TRANSFER DYNAMICS AND CLUSTER ION FRAGMENTATION IN PHENOL/AMMONIA CLUSTERS Technical Report
M. Hineman, D. F. Kelley, and E. R. Bernstein 24 Aug. 1993 21 p
(Contract N00014-89-J-1237)
(AD-A269133; TR-86) Avail: CASI HC A03/MF A01

Excited-state proton transfer dynamics are reported for the phenol(NH3)n cluster system. Excited state proton transfer is shown to occur for this system by isotopic substitution of the hydroxyl proton and ammonia protons. The observed dynamics slow from 80 ps to 600 ps upon cluster deuteration. The effects of cluster vibrational energy and ammonia concentration in the expansion gas are also studied. The results of these experiments are compared with a previous study which used a single excitation energy and varied ionization energy. Our experiments indicate that a significant amount of cluster ion fragmentation occurs for this system and caution must be exercised in assigning the decays observed in a given ion mass channel to a particular parent cluster. Due to the difficulties of associating a given decay curve with a cluster of particular mass, a previously proposed model of proton transfer in isolated clusters which details the effect of cluster vibrational energy on the proton transfer rate, cannot be applied to the phenol/ammonia system. COMBUSTION INSTABILITY PHENOMENA OF IMPORTANCE TO LIQUID PROPELLANT ENGINES Annual Report, 1 Jul. 1992 - 30 Jun. 1993
Robert J. Santoro and William E. Anderson 31 Jul. 1993 23 p
(Grant AF-AFOSR-0336-91)
(AD-A268800; AFOSR-93-0667TR) Avail: CASI HC A03/MF A01

A study examining impinging liquid jets has been underway to determine physical mechanisms responsible for combustion instabilities in liquid bi-propellant rocket engines. Primary atomization has been identified as an important process. Measurements of atomization length, wave structure, and drop size and velocity distribution were made under various ambient conditions. Test parameters included geometric effects and flow effects. It was observed that pre-impingement jet conditions, specifically whether they were laminar or turbulent, had the major effect on primary atomization. Comparison of the measurements with results from a two-dimensional linear aerodynamic stability model of a thinning, viscous sheet were made. Measured turbulent impinging jet characteristics were contrary to model predictions; the structure of waves generated near the point of jet impingement were dependent primarily on jet diameter and independent of jet velocity. It has been postulated that these impact waves are related to pressure and momentum fluctuations near the impingement region and control the eventual disintegration of the liquid sheet into ligaments. Examination of the temporal characteristics of primary atomization (ligament shedding frequency) strongly suggests that the periodic nature of primary atomization is a key process in combustion instability. AN AB INITIO STUDY OF THE WEAKLY BONDED CO-Cl2 COMPLEX Final Report, Mar. 1992 - Mar. 1993
Steven W. Bunte, Cary F. Chabalowski, Curt Wittig, and Robert A. Beaudet Aug. 1993 25 p
(Contract DE-FG03-89ER-04053; DA Proj. 1L1-61102-AH-43)
(AD-A269000; ARL-TR-178) Avail: CASI HC A03/MF A01

Ab initio structure and vibrational frequency calculations have been performed on the weakly bonded CO-Cl2 complex at the SCF and MP2 levels of approximation. Minima were found for the two linear structures, specifically CO-Cl2 and OC-Cl2, with the latter being slightly more stable than the former. In addition, minima were found for two nonlinear structures--one T-shaped and the other essentially parallel. In the T-shaped structure, the oxygen is very weakly bonded to the chlorines (C(sub 2v) symmetry). The parallel isomer is slightly lower in energy than the T-shaped structure; however, both of the nonlinear isomers are less stable than either of the linear isomers. The calculated properties of the OC-Cl2 isomers are in excellent agreement with the experimental results reported earlier, lending further support to the conclusion that the structure of the experimentally observed isomer is OC-Cl2 rather than CO-Cl2. FLAME STRUCTURE STUDIES OF A LEAN 20-TORR H2/N2O/Ar FLAME EMPLOYING MOLECULAR BEAM MASS SPECTROMETRY Final Report, 3 Aug. - 2 Nov. 1992
David C. Dayton and Rosario C. Sausa Aug. 1993 29 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DA Proj. 1L1-61102-AH-43)
(AD-A268889; ARL-TR-183) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

In this report, we present the results of our continued experimental efforts to investigate the structure of low-pressure, burner-stabilized H2/N2O/Ar flames. Coated Pt/Pt-Rh(10%) thermocouples and molecular beam sampling followed by quadrupole mass spectrometric detection (MB/MS) were employed to obtain temperature and species mole fraction profiles, respectively, in a fuel lean (Phi=0.64), 20-torr H2/N2O/Ar flame. Species profiles of H2, N2O, N2, H2O, NO, O2, H, O, and OH are compared to profiles generated using a detailed flame kinetic model. This provides a stringent test of the detailed chemical flame model and chemical mechanism for the H2/N2O/Ar system which is presently being developed at the U.S. Army Research Laboratory to enhance the understanding of nitramine propellant combustion and decomposition. NOVEL CATALYSTS FOR METHANE ACTIVATION
A. S. Hirschon, R. Malhotra, and R. B. Wilson Jul. 1993 16 p
(Contract DE-AC22-92PC-92112)
(DE93-040630; DOE/PC-92112/T2) Avail: CASI HC A03/MF A01

The objectives of this project are to test novel fullerene based catalysts for application in methane activation. Fullerenes are a recently discovered allotrope of carbon that have been found to possess unusual properties, some of which may be ideal for methane conversion to higher hydrocarbons. The project is divided into three technical tasks. Task 1 deals with the synthesis and characterization of the fullerenes and fullerene soots, Task 2 with the testing of the catalysts, and Task 3 with the evaluation of the results and technical reporting requirements. This quarter we prepared fullerene soot and conducted experiments to determined its reactivity towards methane, hydrogen, and ethylene. Soot containing approximately 12-14 wt % fullerenes was prepared by the discharge method of Haufler et al. SRI is in the process of developing methodology to produce large scale amounts of fullerenes and fullerene based materials and is working with a private company to that end. In order to provide a background of fullerene soot and describe some of these methods we have included Appendix A. We conducted some preliminary experiments in order to determine the temperature regime at which fullerene based soot would begin to be active for methane activation. We also were interested to determine if the soot would interact with methane or any of the product gases to undergo hydrogenation or methanation reactions. DOE

METAL SLURRY DROPLET AND SPRAY COMBUSTION Final Report, 1 Oct. 1988 - 30 Sep. 1992
W. A. Sirignano and R. Bhatia 15 Sep. 1993 219 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-89-J-1135)
(AD-A269648) Avail: CASI HC A10

Analytical and numerical studies on n-octane and aluminum metal slurry droplet combustion and metal slurry spray combustion are discussed. Two limiting isolated droplet configurations are studied: one with a large metal particle enveloped by a liquid hydrocarbon and another with many fine metal particles inside a liquid drop. Vaporization models for isolated slurry droplets are formulated which can be used in spray combustion calculations. An analytical model describes the combustion of aluminum particles in air. The particle transient heating, the phase-equilibrium conditions of the vapor and condensed products are analyzed. Mass and energy interactions between the slurry droplets and gas flow are studied in an idealized configuration consisting of parallel droplet streams. Without forced convection and preheat of the ambient air to temperatures near the aluminum oxide melting point, the flame does not possess sufficient energy to ignite the metal. Ignition times for the metal particle depend on the solid mass loading and can be several times larger than the liquid fuel burnout time. With many fine metal particles which are initially uniformly distributed in a liquid fuel droplet, depending on the shell characteristics, different modes of liquid vaporization from the droplet can occur. At different combustor locations, interacting and distinct premixed and diffusion type reaction zones are present. The heating and burning times of the metal agglomerate are much larger than the liquid fuel vaporization times and increase with increasing metal particle size and metal loading of the droplets. Flame-balls are stationary spherical premixed flames observed in certain near-limit mixtures. Sufficiently large flame-balls are subject to a three-dimensional instability which defines a maximum mixture strength for which steady flame-balls can exist. The researchers studied the dynamics of flame-balls in the neighborhood of the neutral stability point and show that there is a transcritical bifurcation and that the dynamics are governed by a fifth-order system of nonlinear ordinary differential equations. The late time behavior of the solution of these equations corresponds either to a stationary sphere (stable solution) or a growing prolate spheroid. Prolate spheroids are observed experimentally, and the relationship between the experimental observations and the theoretical predictions. DTIC

TRANSPORT PHENOMENA AND INTERFACIAL KINETICS IN MULTIPHASE COMBUSTION SYSTEMS Annual Technical Report, 15 Feb. 1992 - 14 Feb. 1993
Daniel E. Rosner Aug. 1993 57 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0170-91)
(AD-A270202; AFOSR-93-0712TR) Avail: CASI HC A04

This annual technical report summarizes Yale High Temperature Chemical Reaction Engineering Laboratory research activities (under Grant AFOSR 91-0170) for the one-year period ending 14 February 1993. Among our research results described in detail in the cited references, perhaps the most noteworthy are the development/reporting of: rational methods to predict the accessible surface area of aggregated 'soot' particles in high pressure combustion gases; experimental inference of particle thermophoretic diffusivities for titania aggregates in laminar counterflow laminar diffusion flames; consequences of particle thermophoresis for flame radiation, flame synthesis, and particle-based diagnostics; and quantitative methods for predicting/correlating the effects vapor phase chemical reactions on the rate and quality of vapor-deposited metal oxide thin films. PHOTODISSOCIATION STUDIES OF POLYATOMIC FREE RADICALS Final Report, 1 Jun. 1989 - 30 Sep. 1992
Brad R. Weiner Aug. 1993 152 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F49620-89-C-0070)
(AD-A270084; AFOSR-93-0703TR) Avail: CASI HC A08

An experimental program in gas phase polyatomic photochemistry and photophysics has been extablished in the Department of Chemistry at the University of Puerto Rico. Real time dynamics of sulfur monoxide photoelimination reactions have been studied by laser induced fluorescence spectroscopy of the nascent SO fragment on the B(sup 3)(Sigma(exp -) - X(sup 3)(Sigma(exp -)) transition in the region of 237-295 nm. The group of molecules under investigation are Sulfur dioxide (SO2), dimethyl sulfoxide ((CH3)2SO), and the thionyl halides (SOX2; where X = F, Cl, or Br). In all of these experiments, the parent molecule is irradiated with an excimer laser (either 193 or 248 nm) and the energy disposal into the nascent SO photofragment is determined and used as a mechanistic probe. The experiments indicate that several of these parent molecules undergo three body dissociations. A second set of experiments measures kinetic decay constants of the C2H3O, both in the ground state and in the excited state. The temperature (295-374 K) and pressure (2.5-100 torr) dependencies for the rate constant of the C2H3O + NO2 reaction have been measured by laser flash photolysis/laser induced fluorescence kinetic spectroscopy. The temperature dependent reaction for the decay of C2H3O in the presence of NO2 is characterized over the measured region by the rate expression, k(sub 2) = (1.48 +/- 0.70) x 1O(exp -11)exp(80.7 +/- 23.4K/T)cu cm/molecule-s. Fluorescence decay rates were determined in the presence to ten collision partners: He, Ar, N2, O2, CO, H2, HCl, CO2, C2H4, and CH3OCH = CH2. The measured electronic quenching cross-sections vary from 0.01 - 66.5 sq A. A vibrational level dependence was found for the radiative lifetimes. DTIC

COMPATIBILITY OF REFRIGERANTS AND LUBRICANTS WITH MOTOR MATERIALS, VOLUME 1 Final Report
Robert Doerr and Stephen Kujak May 1993 154 p
(Contract DE-FG02-91CE-23810)
(DE93-040216; DOE/CE-23810/13-Vol-1) Avail: CASI HC A08/MF A02

This volume contains the abstract, scope, discussion of results, charts of motor material compatibility, test procedures, material identifications, and 84 pages of data summary tables. Compatibility test results for 11 pure refrigerants and 17 refrigerant-lubricant combinations with 24 motor materials are included. The greatest effect on the motor materials was caused by adsorption followed by desorption of refrigerants at higher temperatures. High internal pressure of the adsorbed refrigerants and their tendency to evolve from the materials resulted in blisters, cracks, internal bubbles in the varnish, and delamination or bubbles in the sheet insulations. The second effect was extraction or dissolution of materials that lead to embrittlement of some sheet insulations. HCFC-22 and HCFC-22/mineral oil had the most deleterious effects; the materials are expected to be reliable when used with most of the new refrigerants and lubricants. DOE

The development of a versatile picosecond ultraviolet/vacuum ultraviolet temporal spectrometer and its potential use for measuring internal energy redistribution in isolated molecules are described in detail. A detailed description of the double-pass Nd:YAG amplifier and the dye amplifiers is given with the pulse energies achieved in the visible, ultraviolet, and vacuum ultraviolet. The amplified visible pulses are shown to be of sub-picosecond duration and near transform limited. The instrument's temporal response ((le)10 ps) is derived from an instrument limited measurement of the dissociation lifetime of methyl iodide at 266 nm. The methyl iodide experiment is used to discuss the various sources of noise and background signals that are intrinsic to this type of experiment. Non-time-resolved experiments measuring the branching ratio and kinetic energy distributions of products from the 193 nm photodissociation of cyclopentadiene and thiophene are presented. These studies were done using the molecular beam Photofragment Translational Spectroscopy (PTS) technique. The results from the cyclopentadiene experiment confirm that H atom elimination to yield the cyclopentadienyl radical is the dominant dissociation channel. A barrier of (ge)5 kcal/mol can be understood in terms of the delocalization of the radical electron of the cyclopentadienyl fragment. A concerted elimination yielding cyclopropene and acetylene was also observed and is proposed to occur via a bicyclo-(2.1.0)pent-2-ene intermediate. Two other channels, yielding acetylene plus the CH2CHCH triplet carbene, and CH2 plus 1-buten-3-yne, are postulated to occur via ring opening. The implications of the experimental results for bulk thermal oxidation and pyrolysis models

are discussed. The thiophene experiment shows six competing dissociation channels. The postulated intermediates for the various thiophene dissociation channels include bicyclo, ring opened, and possibly ring contracted forms.

SOME SUPERHIGH-FREQUENCY AND MAGNETIC PROPERTIES OF CHEMICALLY PRECIPITATED FILMS

L. V. Kirenskiy, N. S. Chistyakov, L. A. Chekanova, B. P. Tushkov, and G. I. Fish 2 Jun. 1993 12 p Transl. into ENGLISH from Fizika Magnitnikh Plenok (USSR), no. 3, 1970 12 p

(AD-A266195; FASTC-IR(RS)T-0300-93) Avail: CASI HC A03/MF A01

Magnetic films obtained by the method of chemical deposition have, in recent years, attracted the attention of researchers due to their interesting properties, the comparatively simple technology of deposition, and some possibilities for their practical utilization. For the purpose of obtaining additional information about the physical properties of chemically precipitated films and searching for the possibilities of their practical utilization in superhigh-frequency technology, we investigated Co-p magnetic films in the range of the super high frequencies (f = 9000 MHz). The fundamental, superhigh-frequency parameters of films (width and intensity of the line of ferromagnetic resonance, the components of complex shf susceptibility, etc.) were investigated on a standard shf spectrometer with the recording of differential curves of resonance absorption. Measurement of components of complex shf susceptibility was conducted on a setup described in detail earlier. The processes of quasi-static magnetic reversal were also studied. The structural properties of films were investigated by the method of X-ray diffraction analysis. Chemical analysis was conducted by the calorimetric method.

DENSITIES AND VISCOSITIES OF TERNARY AMMONIA/WATER FLUIDS

R. H. Reiner and A. Zaltash Mar. 1993 16 p Presented at the Annual Winter Meeting of the ASME, New Orleans, LA, 28 Nov. - 3 Dec. 1993

(Contract DE-AC05-84OR-21400)

(DE93-015966; CONF-931121-9) Avail: CASI HC A03/MF A01

The densities, viscosities, and boiling points (at barometric pressure) of solutions formed by inorganic salts dissolved in an ammonia/water (NH3/H2O) solvent have been measured. These ternary solutions of ammonia/water/dissolved salt are being investigated to reduce rectification requirements and to expand the temperature range of ammonia/water in advanced absorption cycles. Densities and viscosities of these fluids were measured over the temperature range of 283.15 to 343.15 K (10.0 to 70.0 C). Observed densities and viscosities were expressed as empirical functions of temperature by means of the least-squares method. The dynamic viscosities of ternary fluids were found to be three to seven times greater than those of the binary system of NH3/H2O, which implies that a substantial decrease in the film heat and mass transfer coefficient is possible. However, because this quantitative linkage is not well understood, direct measurements of heat and mass transfer rates in a minisorber are recommended and planned.

SELECTIVE METHANE OXIDATION OVER PROMOTED OXIDE CATALYSTS

K. Klier, R. G. Herman, J. Sarkany, and Q. Sun Mar. 1993 19 p

(Contract DE-FG21-92MC-29228)

(DE93-040002; DOE/MC-29228/3407) Avail: CASI HC A03/MF A01

Sulfate anion was used to modify the surface basicity of 1 wt% Sr/La2O3, and catalytic tests were carried out to probe the selective oxidation of methane to C2 coupling products over these catalysts. Over a range of reaction temperatures of 500-700 C, most of the catalytic tests were carried out with a 1 wt% SO4 (sup 2-)/1 wt% Sr/La2O3 with a CH4 /air = 1/1 reactant mixture at 1 atm and with a gas hourly space velocity (GHSV) = 70,000 (ell)/kg catal/hr. The sulfated catalyst showed the largest improved catalytic effect at 500 C. Compared to the activity of the nonsulfated Sr/La2O3, the sulfated catalyst resulted in enhancement of the methane conversion, the C2 selectivity, and the yield of C2 products. In situ laser Raman spectroscopy was used to characterize the surface of sulfated and nonsulfated catalysts. Preliminary results indicate that the sulfate anion preferentially bonded to the Sr rather than to the La ions. The promoting effect of the acidic sulfate on the catalytic activity of basic Sr/La2O3 seems to be due to the inhibition of carbonate formation on the surface Sr ions.

Numerous fluids have been identified as promising alternative refrigerants, but much of the information needed to predict their behavior as pure fluids and as components in mixtures does not exist. In particular, reliable thermophysical properties data and models are needed to predict the performance of the new refrigerants in heating and cooling equipment and to design and optimize equipment to be reliable and energy efficient. The objective of this fifteen-month project has been to provide highly accurate, selected thermophysical properties data for Refrigerants 32, 123, 124, and 125, and to use these data to fit equations of state and transport property models. The new data have filled gaps in the existing data sets and resolved problems and uncertainties that existed in and between the data sets.

ACCELERATED SCREENING METHODS FOR DETERMINING CHEMICAL AND THERMAL STABILITY OF REFRIGERANT-LUBRICANT MIXTURES. PART 1: METHOD ASSESSMENT

R. Kauffman Apr. 1993 33 p

(Contract DE-FG02-91CE-23810)

(DE93-040215; DOE/CE-23810/10-Pt-1) Avail: CASI HC A03/MF A01

This report presents results of a literature search performed to identify analytical techniques suitable for accelerated screening of chemical and thermal stabilities of different refrigerant/lubricant combinations. Search focused on three areas: Chemical stability data of HFC-134a and other non-chlorine containing refrigerant candidates; chemical stability data of CFC-12, HCFC-22, and other chlorine containing refrigerants; and accelerated thermal analytical techniques. Literature was catalogued and an abstract was written for each journal article or technical report. Several thermal analytical techniques were identified as candidates for development into accelerated screening tests. They are easy to operate, are common to most laboratories, and are expected to produce refrigerant/lubricant stability evaluations which agree with the current stability test ANSI/ASHRAE (American National Standards Institute/American Society of Heating, Refrigerating, and Air-Conditioning Engineers) Standard 97-1989, 'Sealed Glass Tube Method to Test the Chemical Stability of Material for Use Within Refrigerant Systems.' Initial results of one accelerated thermal analytical candidate, DTA, are presented for CFC-12/mineral oil and HCFC-22/mineral oil combinations. Also described is research which will be performed in Part 2 to optimize the selected candidate.

SELECTIVE METHANE OXIDATION OVER PROMOTED OXIDE CATALYSTS

K. Klier, R. G. Herman, J. Sarkany, and Q. Sun Jun. 1993 23 p

(Contract DE-FG21-92MC-29228)

(DE93-040001; DOE/MC-29228/3408) Avail: CASI HC A03/MF A01

A 1 wt% SO4(sup 2(minus))/1 wt% Sr/La2O3 catalyst has been shown by us to be one of the most active catalyst for the oxidative coupling of CH4 to C2 hydrocarbons. One of the by-products is CO2 and this is a potential strong poison for the formation of C2 (sup +) products. Hence, various pretreatments of this catalyst were studied in terms of effect on the catalytic performance. Before the reaction was carried out at 500 or 550 C, the catalyst was pretreated in flowing air or He at 500, 700, or 800 C. Relative to the 500 C treatment, the pretreatment in air at 700 C only slightly decreased the C2 (sup +) selectivity while the CO(x) selectivity increased. This effect was larger when the pretreatment was carried out at 800 C. It was observed that the deactivation effect was slightly smaller when the pretreatments were carried out in He instead of air. For both air and He, the CH4, conversion and the C2 % yield showed more or less parallel changes (small decreases) with increasing pretreatment temperature. After a standard pretreatment (air, 500 C, 1 hr), the reaction temperature was increased stepwise from 500 to 700 C and then lowered to 550 (or 500 C). It was observed that the catalytic performance showed deactivation towards the C2 (sup +) products. Decreasing stepwise the total flow rate (GHSV) of the reacting gas mixture (CH4)/air = 1/1) from 70,175 to 5,388 (ell)/kg catal/hr at a reaction temperature of 550 C caused large changes in both the activity and selectivity. After going back at 550 C to the original GHSV = 70,175 (ell)/kg catal/hr, the temperature was increased stepwise up to 600 C. Up to 580 C, the catalytic activity and selectivity did not change very much. DOE

This dissertation contains investigations in three distinct areas. Chapters 1 and 2 provide an analysis of the effects of electromagnetic phenomena during the initial stages of cell discharge. Chapter 1 includes the solution to Maxwell's equations for the penetration of the axial component of an electric field into an infinitely long cylindrical conductor. Chapter 2 contains the analysis of the conductor included in a radial circuit. Chapter 3 provides a complete description of the equations that describe the growth of an oxide film. A finite difference program was written to solve the equations. The system investigated is the iron/iron oxide in a basic, aqueous solution. Chapters 4 and 5 include the experimental attempts for replacing formaldehyde with an innocuous reducing agent for electroless deposition. In chapter 4, current-versus-voltage curves are provided for a sodium thiosulfate bath in the presence of a copper disk electrode. Also provided are the cathodic polarization curves of a copper/EDTA bath in the presence of a copper electrode. Chapter 5 contains the experimental results of work done with sodium hypophosphite as a reducing agent. Mixed-potential-versus-time curves for solutions containing various combinations of copper sulfate, nickel chloride, and hypophosphite in the presence of a palladium disk electrode provide an indication of the reducing power of the solutions. ATOMIC RESOLUTION ELECTRON ENERGY LOSS SPECTROSCOPY IN THE SCANNING TRANSMISSION ELECTRON MICROSCOPE
N. D. Browning, M. F. Chisholm, and S. J. Pennycook 1993 3 p
Presented at the 6th Analytical Electron Microcopy (AEM) Workshop, Los Angeles, CA, 11-16 Jul. 1993
(Contract DE-AC05-84OR-21400)
(DE93-015334; CONF-930755-3) Avail: CASI HC A01/MF A01

Electron energy loss spectroscopy (EELS) in the scanning transmission electron microscope (STEM) is an invaluable tool for the microanalysis of materials, providing information on both compositional and electronic structure fluctuations on the sub-nanometer scale. To utilize fully the high resolution potential of the energy loss signal, it is essential to have a reference high-resolution image showing the atomic structure in the region of study. The recently developed high-resolution Z-contrast imaging technique for the STEM, provides an intuitive reference image of the atomic structure that, as both imaging and microanalysis can be performed simultaneously, can be conveniently used to position the electron probe over individual atomic columns. The spatial resolution of both the image and the energy loss spectrum can be identical, and in principle limited only by the probe size of the microscope. Therefore, for the 2.2 A probe size of the VG HB501 UX dedicated STEM, there exists the ability to be able to resolve individual atomic columns or planes. DOE

(DE93-016601; LA-UR-93-2196; CONF-930571-24) Avail: CASI HC A02/MF A01

The goal of this research is to develop a method to treat mixed hazardous wastes containing selected organic compounds and heavy metals, including actinide elements. One approach is to destroy the organic compounds via electrochemical oxidation to carbon dioxide, then recover the metal contaminants through normally accepted procedures such as ion exchange, precipitation, etc. The authors have chosen to study the electrochemical oxidation of a simple alcohol, iso-propanol. Much of the recent work reported involved the use of an electron transfer mediator, usually the silver(1)/(2) redox couple. This involved direct electrochemical generation of the mediator at the anode of a divided cell followed by homogeneous reaction of the mediator with the organic compound. In this study the authors have sought to compare the mediated reaction with direct electrochemical oxidation of the organic. In addition to silver(1)/(2), they also looked at the cobalt(2)/(3) redox couple. In the higher oxidation state, both of these metal ions readily hydrolyze in aqueous solution to ultimately form insoluble oxide. The study concluded that in a 6M nitric acid solution at room temperature, iso-propanol can be oxidized to carbon dioxide and acetic acid. Acetic acid is a stable intermediate and resists further oxidation. The presence of Co(3) enhances the rate or efficiency of the reaction. DOE

PENETROMETER COMPATIBLE, FIBER-OPTIC SENSOR FOR CONTINUOUS MONITORING OF CHLORINATED HYDROCARBONS: FIELD TEST RESULTS
F. P. Milanovich, S. B. Brown, and B. W. Colston, Jr. Apr. 1993 7 p Presented at the Chemical Sensor Symposium, Honolulu, HI, 16-21 May 1993
(Contract W-7405-eng-48)
(DE93-017974; UCRL-JC-112182; CONF-9305124-3) Avail: CASI HC A02/MF A01

We have developed and field tested a fiber optic chemical sensor for use in environmental monitoring and remediation. The principle of detection is colorimetric and is based on an irreversible chemical reaction between a specific reagent and the target compound. The formation of reaction products are monitored remotely with optical fibers. Successive or on-demand measurements are made possible with a reagent reservoir and a miniature pumping system. The sensor has been evaluated against gas chromatography standards and has demonstrated accuracy and sensitivity sufficient for the environmental monitoring of the contaminants triceoroethlyene (TCE) and chloroform. The sensor system can be used for bench-top analyses or for in-situ measurements such as groundwater and vadose monitoring wells or in penetrometry mediated placements. DOE

UNIMOLECULAR PHOTODISSOCIATION DYNAMICS OF KETENE (CH2CO): THE SINGLET/TRIPLET BRANCHING RATIO AND EXPERIMENTAL OBSERVATION OF THE VIBRATIONAL LEVEL THRESHOLDS OF THE TRANSITION-STATE Ph.D. Thesis
S. K. Kim May 1993 202 p
(Contract DE-AC03-76SF-00098)
(DE93-019252; LBL-34251) Avail: CASI HC A10/MF A03

The rotational distributions of CO products from the dissociation of ketene at photolysis energies 10 cm(exp -1) below and 56, 110, 200, 325, 425, 1,107, 1,435, 1,720, and 2,500 cm(exp -1) above the singlet threshold, are measured in a supersonic free jet of ketene. The CO(v'') = 0 rotational distributions at 56, 110, 200, 325, and 425 cm(exp -1) are bimodal. The peaks at low J's, which are due to CO from the singlet channel, show that the product rotational distribution of CO product from ketene dissociation on the singlet surface is well described by phase space theory (PST). For CO(v'') = 0 rotational distributions at higher excess energies, the singlet and triplet contributions are not clearly resolved, and the singlet/triplet branching ratios are estimated by assuming that PST accurately predicts the CO rotational distribution from the singlet channel and that the distribution from the triplet channel changes little from that at 10 cm(exp -1) below the singlet threshold. At 2,500 cm(exp -1) excess energy, the CO(v'') = 1 rotational distribution is obtained, and the ratio of CO(v'') = 1 to CO(v'') = 0 products for the singlet channel is close to the variational RRKM calculation, 0.038, and the separate statistical ensembles (SSE) prediction, 0.041, but much greater than the PST prediction, 0.016. Rate constants for the dissociation of ketene (CH2CO) and deuterated ketene (CD2CO) have been measured at the threshold for the production of the CH(D2) and CO. Sharp peaks observed in photofragment excitation (PHOFEX) spectra probing CO (v = 0, J = 2) product are identified with the C-C-O bending mode of the transition state. RRKM calculations are carried out for two limiting cases for the dynamics of K-mixing in highly vibrationally excited reactant states. DOE

EXPERIMENTAL STUDY OF FLAME FRONT INTERACTIONS Ph.D. Thesis [ETUDE EXPERIMENTALE DE L'INTERACTION DE FRONTS DE FLAMMES]
Didier Larrauri 1991 114 p In FRENCH
(ECL-91-40; ETN-93-94586) Avail: CASI HC A06/MF A02

The flame front interaction is characterized by measuring the temperature, the hydrogen concentration, and the flame velocity and applying tomography for flow visualizations. Particular attention is given to flow velocity measurements which give information on the dynamics of processes. The purpose of the investigation is to study the coalescence of flame fronts at the flow between two flames. Data was acquired under three combustion conditions: laminar flames; flame and vortice interactions, where the vortices were generated by a von Karman device placed between the two flames; and the flame fronts are disturbed by a turbulent flow due to a grid. The results show that the interaction between two flames can be detected not only by changes of flame behavior, but also by flow changes in the region between the two flames. ESA

CONSTRUCTION OF A SCANNING TUNNELING MICROSCOPE IN LIQUID MEDIA: STUDIES OF THE PREPARATION OF THE GRAPHITE SURFACE AND THE CHEMICAL CLEANING OF INDIUM PHOSPHIDE Ph.D. Thesis [REALISATION D'UN MICROSCOPE A EFFET TUNNEL EN MILIEU LIQUIDE. ETUDES DE LA FONCTIONNALISATION DE LA SURFACE GRAPHITIQUE ET DU DECAPAGE CHIMIQUE DU PHOSPHURE D'INDIUM]
Magali Phaner 1992 170 p In FRENCH
(ECL-92-25; ETN-93-94589) Avail: CASI HC A08/MF A02

The principle of the Scanning Tunneling Microscope (STM) and the exploitation of images with different representations and the problems of theoretical interpretation are presented. The realization of the microscope is described. The scanning tunneling microscope is a precision device sensitive to a large range of perturbations. Different perturbations are studied and the retained alternatives are presented. The liquid environment adds some instrumental constraints with the need of a tree electrodes cell and a potentiostat. Two studies realized with this apparatus are presented. The first one concerns the deposition of palladium particles by chemical way on HOPG (Highly Oriented Pyrolitic Graphite) in order to study catalysts. A special study is made on the graphite surface at atomical scale after the oxidation phase. The images show a modification of the atomic network attributed to the presence of organic groups. Some reactive sites are then created in the graphitic surface and are used for the palladium complexes fixation. The second experiment consists in the observation of the InP(n) surface in diluted acid solution. The surface is prepared by a mechanochemical polish. The liquid is used in that case to protect the surface from an oxidation. The preliminary study is the first one made in InP in liquids. It shows a relief constituted by some tenths of nanometers high hillocks. ESA

ULTRAVIOLET ABSORPTION CROSS-SECTIONS OF SOME CARBONYL COMPOUNDS AND THEIR TEMPERATURE DEPENDENCE
D. Gillotay, P. C. Simon, and L. Dierickx 1993 18 p Presented at Quadrennial Ozone Symposium, Charlottesville, VA, 4-13 Jun. 1992 Submitted for publication
(Aeronautica-Acta-A-368-1993; ETN-93-94960) Copyright Avail: Issuing Activity (Institut d'Aeronomie Spatiale de Belgique, 3 Avenue Circulaire, B-1180 Brussels, Belgium)

Ultraviolet absorption cross section of phosgene (CCl2O), trichloroacetylchloride (CCl3-CClO), and trichloroacetaldehyde (CCl3-CHO) were measured between 170 and 320 nm for temperature ranging from 210 to 295 K with a classical double beam equipment. The data are compared with other available determinations performed at room temperature. Photodissociation coefficients are estimated and their temperature dependence is discussed. Impact of the photodissociation on the total atmospheric destruction of these compounds is illustrated. ESA

METALLIZATION AND CHARGE-TRANSFER GAP CLOSURE OF TRANSITION-METAL IODIDES UNDER PRESSURE Ph.D. Thesis
A. Li-Chung Chen May 1993 105 p
(Contract DE-AC03-76SF-00098)
(DE93-040301; LBL-34400) Avail: CASI HC A06/MF A02

It is shown with resistivity and near-IR absorption measurements that NiI2, CoI2, and FeI2 metallize under pressure by closure of the charge-transfer energy gap at pressures of 17, 10, and 23 GPa, respectively, which is close to the antiferromagnetic-diamagnetic transition in NiI2 and CoI2. Thus, the magnetic transitions probably are caused by the metallization; in NiI2 and CoI2, the insulator-metal transitions are first order. Moessbauer and XRD data were also collected. DOE

(DE93-019512; ANL/ES/CP-80045; CONF-930804-15) Avail: CASI HC A02/MF A01

An analysis is carried out to determine the effects of the diffusional resistance on the rate of the adsorption of ammonia in an aqueous solution. A performance prediction model is developed to calculate the local rate of heat and mass transfer, including physical and thermodynamic property calculations of the mixture. An algorithm is developed for calculating the interfacial conditions. The local heat- and mass-transfer calculation is then incorporated into the performance prediction method for adsorption for a given geometry. DOE

CONTROL OF CATALYTIC HYDROTREATING SELECTIVITY WITH AMMONIA
C. N. Satterfield and S. Gultekin 1993 6 p
(Contract DE-FG22-89PC-89775)
(DE93-041223; DOE/PC-89775/13) Avail: CASI HC A02/MF A01

We have chosen the following as our standard reaction conditions: T = 3600, total pressure about 6.9 MPa, partial pressure of PBz = 24.4 kPa, partial pressure of H_2S = 13.3 kPa, partial pressure of NH_3 = 13.3 kPa, and space-time = 200 h. g. cat/mol PBz. The carrier liquid is hexadecane ($C_{16}H_{34}$). As before, the H_2S and NH_3 are generated in situ by hydrogenation of 1-dodecane thiol and n-propyl amine, respectively, added to the C16 feed. The activity of the fresh catalyst dropped to a steady state level after about 120 hours on stream following which four runs were carried out at p.p. NH_3 values of 0, 13.3, 24.4, and 48.8 kPa, respectively. For each NH_3 p.p., space-times were varied at the following levels: 50, 100, 200, 400, and 600. Analyses were made for propylcyclohexene (C(sub A)), propylcyclohexane (C(sub B)), and benzene (C(sub D)). No other products were found in any significant amounts. The ratio C(sub B)/C(sub D) is a measure of the activity for ring hydrogenation relative to hydrocracking. The data are shown in four tables that follow. The results will be analyzed kinetically in the next quarter. However, the following generalizations are evident: NH_3 significantly reduces the activity of the catalyst for both types of reaction; and the activity for hydrocracking is reduced more than that for ring hydrogenation, a favorable result, but the effect is not large at the conditions studied thus far. The effect is most evident at low NH_3 concentrations. DOE

HIGH RESOLUTION TRANSMISSION ELECTRON MICROSCOPY OF MESOPOROUS MCM-41 TYPE MATERIALS Technical Report, 1 Jun. 1993 - 31 May 1994
V. Alfredsson, M. Keung, A. Monnier, G. Stucky, and K. Unger 30 Sep. 1993 7 p
(Contract N00014-90-J-1159)
(AD-A271271) Avail: CASI HC A02/MF A01

The mesoporous silica based materials invented by scientists of the Mobil Corporation have attracted considerable interest since the first scientific publications appeared in 1992. Recently a detailed mechanism was suggested how these materials can be formed via a layered intermediate. Although already in the first publications transmission electron micrographs have been published, it is yet not clear whether the pore shape is hexagonal or round. A model describing the intensities of the X-ray diffraction patterns is favoring a hexagonal pore shape. This was, however, not confirmed by other techniques. Here we present for the first time a direct observation of the transition between the layered and the hexagonal phase which also allows to discriminate between two possible mechanisms for this transformation, as well as direct evidence of the hexagonal pore shape. THE APPLICATION OF JET SPRAY AND ION BEAM CONTAMINATION REMOVAL TECHNIQUES TO SAMPLES FROM THE LDEF SPACECRAFT Report, Jun. - Sep. 1992
S. P. Hotaling Jun. 1993 47 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A270973; RL-TR-93-109) Avail: CASI HC A03

Two samples from LDEF experiment M10003-4 were analyzed for molecular and particulate contamination prior to and following treatment with advanced satellite contamination removal techniques (CO_2 Gas/Solid Jet Spray and Oxygen Ion Beam). The pre- and post-cleaning measurements and analyses are presented. The Jet Spray removed particulates in seconds. The low energy reactive oxygen ion beam removed 5000 angstroms of photopolymerized hydrocarbon contamination in less than 1 hour. Spectroscopic analytical techniques were applied to the analysis of cleaning efficiency including: Fourier transform infrared, auger, x-ray photo emission, energy dispersive x-ray, and ultraviolet/visible. The results of this work suggest that the contamination was due to spacecraft self contamination enhanced by atomic oxygen plasma dynamics and solar UV radiation. These results also suggest the efficacy for the Jet Spray and Ion Beam contamination control technologies for spacecraft optical surfaces. DTIC

(AD-A270660; WL-TR-93-2061) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Diagnostic techniques are employed to investigate flows typical of a gas turbine combustor with the aim of furthering the understanding of the complex physical and chemical processes involved and using this understanding in validating and developing combustion Computational Fluid Dynamic (CFD) codes. Detailed measurements of velocities and Reynolds stresses have been made with a Laser Doppler Velocimeter (LDV) in an axisymmetric combustor with a strongly swirling, isothermal, turbulent flow. Anomalies identified in the initial measurements were attributed to LDV signal noise problems caused by reflections off the internal combustor walls. Future LDV measurements will be taken along a vertical diameter within the combustor to minimize these noise problems. Comparisons of the isothermal measurements with CFD predictions are presented and discussed. Both a Reynolds Stress Transport Model (RSTM) and a k epsilon turbulence model have been employed. The RSTM outperforms the k - epsilon model for this strongly swirling flow. Although the bar-(v'w') shear stress could not be measured with the current combustor configuration, the results from the modeling illustrate the important role played by the bar-(v'w') shear stress in defining the nature of the swirling flow. A new Rolls-Royce designed and manufactured water-cooled combustor, with enhanced optical access will permit the simultaneous measurement of all velocity components and all Reynolds stresses. Details of this new test section are presented. DTIC

THE EFFECT OF SURFACE TREATMENT AND GASEOUS RUST PROTECTION PAPER ON THE ATMOSPHERIC CORROSION STABILITY OF ALUMINIUM ALLOY
Guizhong Gao (Beijing Inst. of Nuclear Engineering, China.) Mar. 1992 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-623326; CNIC-00601; BINE-0017) Avail: Issuing Activity (Department of Energy (DOE)) (US Sales Only)

The experimental results of atmospheric corrosion of 166 aluminum alloy of Al-Mg-Si-Cu system and 167 aluminum alloy of Al-Mg-Si-Cu-Fe-Ni system for different surface treatment and different wrapping papers used are introduced. The results show: (1) The composition of aluminum alloy has some effect on the performance of atmospheric corrosion stability and the local corrosion depth for 167 aluminum alloy specimen is considerable. (2) After 8 years storage, the 167 aluminum alloy tubular specimen, which was treated with surface treatment in deionized water at 100 to approx 230 deg C, has no spot of atmospheric corrosion found. (3) Within the test period, the performance of atmospheric corrosion stability by sulphuric-acid anodization film is remarkable. (4) The No. 19 gaseous rust protection paper has no effect of atmospheric corrosion stability on the 166 and 167 aluminum alloys which were treated with quenching and natural ageing method. DOE

MODELING MICROSTRUCTURAL EVOLUTION AND THE MECHANICAL RESPONSE OF SUPERPLASTIC MATERIALS
D. R. Lesuer, C. K. Syn, K. L. Cadwell, and C. S. Preuss 11 Jan. 1993 16 p Presented at the Fall Meeting of the Metallurgical Society and American Institute of Metallurgical and Petroleum Engineers, Chicago, IL, 1-5 Nov. 1992
(Contract W-7405-eng-48)
(DE93-014417; UCRL-JC-110128; CONF-921109-5) Avail: CASI HC A03/MF A01

A model was developed that accounts for grain growth during superplastic flow and its subsequent influence on stress-strain-strain rate behavior. These studies are experimentally based and have involved two different types of superplastic materials - a quasi-single phase metal (Coronze 638) and a microduplex metal (ultrahigh-carbon steel - UHCS). In both materials the kinetics of strain-enhanced grain growth were studied as a function of strain, strain rate, and temperature. An equation for the rate of grain growth was developed that incorporates the influence of temperature. The evolution of the grain size distribution during superplastic deformation was also investigated. Our model integrates grain growth laws derived from these studies with two mechanism based, rate dependent constitutive laws to predict the stress-strain-strain rate behavior of materials during superplastic deformation. The influence of grain size distribution and its evolution with strain and strain rate on the stress-strain-strain rate behavior was represented through the use of distributed parameters. The model can capture the stress-strain-strain rate behavior over a wide range of strains and strain rates with a single set of parameters. Many subtle features of the mechanical response of these materials can be adequately predicted. DOE

This strategic planning exercise identified and characterized new and emerging advanced metallic technologies in the context of the drastic changes in global politics and decreasing fiscal resources. In consideration of a hierarchy of technology thrusts stated by various Department of Defense (DOD) spokesmen, and the need to find new and creative ways to acquire and organize programs within an evolving Wright Laboratory, five major candidate programs identified are C-17 Flap, Transport Fuselage, Mach 5 Aircraft, Fighter Structures, and Missile Structures. These results were formed by extensive discussion with selected major contractors and other experts, and a survey of advanced metallic structure materials. Candidate structural applications with detailed metal structure descriptions bracket a wide variety of uses which warrant consideration for the suggested programs. An analysis on implementing smart skins and structures concepts is given from a metal structures perspective. DOE

ALLOY DEVELOPMENT OF FeAl ALUMINIDE ALLOYS FOR STRUCTURAL USE IN CORROSIVE ENVIRONMENTS
C. T. Liu, V. K. Sikka, and C. G. McKamey Feb. 1993 68 p
(Contract DE-AC05-84OR-21400)
(DE93-015100; ORNL/TM-12199) Avail: CASI HC A04/MF A01

Objectives include adequate ductilities (greater than 10%) at ambient temperature, high-temperature strength better than stainless steels (types 304 and 316), and fabricability and weldability by conventional techniques (gas tungsten arc). The alloys should be capable of being corrosion resistant in molten nitrate salts with rates lower than other iron-base structural alloys and coating materials (such as Fe-Cr-Al alloys). Such corrosion rates should be less than 0.3 mm per year. The FeAl aluminide containing 35.8 at. % Al was selected as base composition. Preliminary studies indicate that additions of B and Zr, increase the room-temperature ductility of FeAl. Further alloying with 0.2% Mo, and/or 5% Cr, improves the creep. Our preliminary alloying effort has led to identification of the following aluminide composition with promising properties: Fe - (35 +/- 2)Al - (0.3 +/- 0.2)Mo - (0.2 +/- 0.15)Zr - (0.3 +/- 0.2)B up to 5Cr, at. %. However, this composition is likely to be modified in future work to improve the weldability of the alloy. The FeAl alloy FA-362 (Fe-35.8% Al-0.2% Mo-0.05% Zr-0.24% B) produced by hot extrusion at 900 C showed a tensile ductility of more than 10% at room temperature and a creep rupture life longer than unalloyed FeAl by more than an order of magnitude at 593 C at 138 MPa. Melting and processing of scaled-up heats of selected FeAl alloys are described. Forging, extruding, and hot-rolling processes for the scale-up heats are also described. DOE

ATLAS OF FORMABILITY: ULTIMET Final Report, 28 Dec. 1992 - 24 Mar. 1993
24 Mar. 1993 65 p
(Contract N00140-88-C-RC21)
(AD-A268352) Avail: CASI HC A04/MF A01

In this investigation, flow behavior of Ultimet alloy was studied by conducting compression tests over a wide range of temperatures (950-1200 C) and strain rates (0.001-20/s). The true stress-true strain flow curves are presented for each test condition. Constitutive relations were determined from the flow behavior, and a dynamic material modeling was performed on this material. Thus, the optimum processing condition in terms of temperature and strain rate was identified as 1012 C and 0.001/s for this alloy. Workability of the material as a function of strain rate and temperature was also determined. Microstructural changes during high temperature deformation were characterized, and selective micrographs are presented together with corresponding flow curves. Dynamic recrystallization and grain growth occurred during high temperature deformation in some test conditions.

This report supplies ample mechanical and microstructural data on Ultimet alloy for engineers in the field of metalworking process design. DTIC

In this investigation, flow behavior of Haynes 188 alloy was studied by conducting compression tests over a wide range of temperatures (950 - 1200 C) and strain rates (0.001 - 20 /s). The true stress-true strain flow curves are presented for each test condition. Constitutive relations were determined from the flow behavior, and a dynamic material modeling was performed on this alloy. Thus, the optimum processing condition in terms of temperature and strain rate was identified as 1100 C and 0.001/s for this alloy. Microstructural changes during high temperature deformation were also characterized, and selective micrographs are presented together with corresponding flow curves. Dynamic recrystallization and grain growth occurred during high temperature deformation over the range of temperatures tested. This report supplies ample mechanical and microstructural data on Haynes 188 alloy for engineers in the field of metalworking process design. The data presented here are also very helpful in finite element analysis of metalworking processes. DTIC

ASSESSMENT OF AN IMPROVED MULTIAXIAL STRENGTH THEORY BASED ON CREEP-RUPTURE DATA FOR INCONEL 600
R. L. Huddleston 1993 11 p Presented at the Pressure Vessels and Piping Conference, Denver, CO, 25-29 Jul. 1993
(Contract DE-AC05-84OR-21400)
(DE93-015929; CONF-930702-44) Avail: CASI HC A03/MF A01

A new multiaxial strength theory incorporating three independent stress parameters was developed and reported by the author in 1984. It was formally incorporated into ASME Code Case N47-29 in 1990. The new theory provided significantly more accurate stress-rupture life predictions than obtained using the classical theories of von Mises, Tresca, and Rankins (maximum principal stress), for Types 304 and 316 stainless steel tested at 593 and 600 C respectively under different biaxial stress states. Additional results for Inconel 600 specimens tested at 816 C under tension-tension and tension-compression stress states are presented in this paper and show a factor of approximately 2.4 reduction in the scatter of predicted versus observed lives as compared to the classical theories of von Mises and Tresca and a factor of about 5 as compared to the Rankins theory. A key feature of the theory, which incorporates the maximum deviatoric stress, the first invariant of the stress tensor, and the second invariant of the deviatoric stress tensor, is its ability to distinguish between life under tensile versus compressive stress states. A NEW MULTIPHASE EQUATION OF STATE FOR IRON
G. I. Kerley 1993 4 p Presented at the 14th International Conference of the International Association for the Advancement of High Pressure Science and Technology, Colorado Springs, CO, 27 Jun. - 2 Jul. 1993
(Contract DE-AC04-76DP-00789)
(DE93-017629; SAND-93-1455C; CONF-930676-6) Avail: CASI HC A01/MF A01

The PANDA code was used to develop an equation of state (EOS) for iron. Separate EOS tables were constructed for four solid phases and the fluid phase. The phase diagram and multiphase EOS table were then computed using the free energies. Results are in good agreement with thermophysical, static compression, phase boundary, and shock-wave measurements. Predicted pressures for the shock-induced epsilon-gamma and gamma-liquid transitions agree with those determined from sound speed measurements. Predicted melting temperatures fall in between two recent sets of experimental data which sharply disagree with one another. DOE

TECHNIQUE TO ELIMINATE HELIUM INDUCED WELD CRACKING IN STAINLESS STEELS
Chin-An Wang, B. A. Chin, and M. L. Grossbeck 1992 10 p Presented at the 16th Annual Symposium of American Society of Testing and Materials on Effects of Radiation on Materials, Denver, CO, 21-25 Jun. 1992
(Contracts DE-AC05-84OR-21400; DE-FG05-91ER-54134)
(DE93-015982; CONF-920673-20) Avail: CASI HC A02/MF A01

Experiments have shown that Type 316 stainless steel is susceptible to heat-affected-zone (HAZ) cracking upon cooling when welded using the gas tungsten arc (GTA) process under lateral constraint. The cracking has been hypothesized to be caused by stress-assisted helium bubble growth and rupture at grain boundaries. This study utilized an experimental welding setup which enabled different compressive stresses to be applied to the plates during welding. Autogenous GTA welds were produced in Type 316 stainless steel doped with 256 appm helium. The application of a compressive stress, 55 Mpa, during welding suppressed the previously observed catastrophic cracking. Detailed examinations conducted after welding showed a dramatic change in helium bubble morphology. Grain boundary bubble growth along directions parallel to the weld was suppressed. Results suggest that stress-modified welding techniques may be used to suppress or eliminate helium-induced cracking during joining of irradiated materials. DOE

SUPERHARDNESS EFFECT IN Au/Ni MULTILAYERS
A. F. Jankowski Mar. 1993 24 p Presented at the 1st International Symposium on Metallic Multilayers, Kyoto, Japan, 1-5 Mar. 1993
(Contract W-7405-eng-48)
(DE93-016444; UCRL-JC-112831; CONF-9303193-1) Avail: CASI HC A03/MF A01

The presence of an enhanced hardness, that is a 'superhardness effect', is found as a behavior parallel to the supermodulus effect in Au/Ni multilayer structures. The submicron thick Au/Ni coatings are prepared by magnetron sputter deposition. A microindenter is used to measure load as a function of indentation depth. An increase in hardness is measured as the Au/Ni layer pair spacing decreases. A local maximum in hardness occurs for samples with layer pairs consisting of 4-6 atomic planes of each metal component. DEVELOPMENT OF ALTERNATIVES TO LEAD-BEARING SOLDERS
Paul T. Vianco 1993 17 p Presented at the Surface Mount Technical Association International Conference, San Jose, CA, 31 Aug. - 2 Sep. 1993 Prepared in cooperation with National Center for Mfg. Sciences, Ann Arbor, MI
(Contract DE-AC04-76DP-00789)
(DE93-016509; SAND-93-0225C; CONF-9308126-1) Avail: CASI HC A03/MF A01

Soldering technology using tin-lead alloys has had a significant role in the packaging of highly functional, low cost electronic devices. The elimination of lead from all manufactured products, whether through legislation or tax incentives, will impact the electronics community which uses lead-containing solders. In response to these proposed measures, the National Center for Manufacturing Sciences has established a multi-year program involving participants from industry, academia, and the national laboratories with the objective to identify potential replacements for lead-bearing solders. Selection of candidate alloys is based upon the analysis of materials properties, manufacturability, and modeling codes for reliability prediction as well as toxicological properties and resource availability data developed in the program. MECHANICAL PROPERTIES OF EXCIMER LASER MODIFIED TITANIUM SURFACES
T. R. Jervis, T. G. Zocco, K. M. Hubbard, and M. Nastasi 1993 6 p Presented at the MRS Symposium on Thin Films, Stresses and Mechanical Properties, Pittsburgh, PA, 12-16 Apr. 1993
(Contract W-7405-eng-36)
(DE93-012663; LA-UR-93-1201; CONF-9304136-1) Avail: CASI HC A02/MF A01

Excimer laser processing enables both thermally-driven transformations and the incorporation of solutes into the surface of materials through melting and diffusional mixing. We have examined the effect of excimer laser processing on the microstructure and surface mechanical properties of titanium alloys. Changes in the surface hardness due to laser processing were studied using a Nanoindenter (trademark). Alloying experiments using both mixing of evaporated surface layers of boron and laser gas alloying in air and in nitrogen all result in changes in the surface hardness of the material. Alloying with boron results in an amorphous surface which is somewhat harder than the as polished surface. Laser processing in air and pure nitrogen results in incorporation of oxygen and nitrogen and the development of fine (approximately 50 nm) precipitates of TiO and TiN respectively. Substantial increases in surface hardness result due to solution and precipitation mechanisms. The effects of alloying on the surface hardness of the materials will be discussed in terms of the concentration of the solute and microstructures observed. DOE

N94-17915# Oak Ridge National Lab., TN.
HELIUM-INDUCED WELD DEGRADATION OF HT-9 STEEL
Chin-An Wang (Auburn Univ., AL.), B. A. Chin (Auburn Univ., AL.), Hua T. Lin, and M. L. Grossbeck 1992 15 p Presented at the 16th Annual ASTM Symposium on Effects of Radiation on Materials, Denver, CO, 21-25 Jun. 1992
(Contracts DE-AC05-84OR-21400; DE-FG05-86ER-52139; DE-AC05-76OR-00033)
(DE93-015981; CONF-920673-21) Avail: CASI HC A03/MF A01

Helium-bearing Sandvik HT-9 ferritic steel was tested for weldability to simulate the welding of structural components of a fusion reactor after irradiation. Helium was introduced into HT-9 steel to 0.3 and 1 atomic parts per million (appm) by tritium doping and decay. Autogenous single pass full penetration welds were produced using the gas tungsten arc (GTA) welding process under laterally constrained conditions. Macroscopic examination showed no sign of any weld defect in HT-9 steel containing 0.3 appm helium. However, intergranular micro cracks were observed in the HAZ of HT-9 steel containing 1 appm helium. The microcracking was attributed to helium bubble growth at grain boundaries under the influence of high stresses and temperatures that were present during welding. Mechanical test results showed that both yield strength (YS) and ultimate tensile strength (UTS) decreased with increasing temperature, while the total elongation increased with increasing temperature for all control and helium-bearing HT-9 steels. DOE

PHASE SEPARATION AND ORDERING PROCESS IN Al-Li ALLOYS STUDIED BY SMALL-ANGLE NEUTRON SCATTERING AND NEUTRON DIFFRACTION
M. Furusaka, S. I. Fujikawa (Tohoku Univ., Sendai, Japan.), and J. M. Tranquada 1993 6 p Presented at the International Symposium on Advanced Nuclear Energy Research-Neutrons as Microscopic Probes, Mito Ibaraki, Japan, 10-12 Mar. 1993
(Contract DE-AC02-76CH-00016)
(DE93-016750; BNL-49081; CONF-9303190-2) Avail: CASI HC A02/MF A01

To study phase separation kinetics of Al-9.5at.%Li polycrystalline alloys in which precipitates have ordered Al3Li ((delta)(prime)) structure, profile analysis of small-angle neutron scattering and superlattice reflections (100) and (110) were done. A small-angle scattering instrument and a triple-axis spectrometer in elastic mode were used in the measurements. Strong texture was observed in the reflections. Therefore, measurements were done using the crystal orientation where the intensity of the reflection was at the maximum. Profiles of small-angle scattering and superlattice reflections were almost identical at higher momentum transfer side. At lower momentum transfer side, small-angle scattering showed interference effects, but superlattice reflection did not show any sign of interference. Integrated intensities of superlattice reflections were obtained and compared with small-angle scattering intensity. The order parameter was not saturated in the (delta)(prime) precipitates at the early stage of the phase separation process. DOE

N94-18003# Sandia National Labs., Albuquerque, NM.
EMBRITTLEMENT OF SURFACE MOUNT SOLDER JOINTS BY HOT SOLDER-DIPPED, GOLD-PLATED LEADS
P. T. Vianco 1993 45 p Presented at the Surface Mount Technical Association International Conference, San Jose, CA, 31 Aug. - 2 Sep. 1993
(Contract DE-AC04-76DP-00789)
(DE93-017659; SAND-93-0082C; CONF-9308126-3) Avail: CASI HC A03/MF A01

The detachment of beam-leaded transistors from several surface mount circuit boards following modest thermal cycling was examined. Microstructural analysis of the package leads and bonding pads from the failed units indicated that gold embrittlement was responsible for a loss of solder joint mechanical integrity that caused detachment of transistors from the circuit boards. An analysis of the hot dipping process used to remove gold from the leads prior to assembly demonstrated that the gold, although dissolved from the lead, remained in the nearby solder and was subsequently retained in the coating formed on the lead upon withdrawal from the bath. This scenario allowed gold to enter the circuit board solder joints. It was hypothesized, and later confirmed by experimental trials, that increasing the number of dips prevented gold from entering the solder coatings. DOE

EFFECT OF PHASE CHANGE IN A DEBRIS CLOUD ON A BACKWALL STRUCTURE
L. N. Kmetyk, L. C. Chhabildas, M. B. Boslough, and R. J. Lawrence 1993 4 p Presented at the 14th International Conference of the International Association for the Advancement of High Pressure Science and Technology, Colorado Springs, CO, 27 Jun. - 2 Jul. 1993
(Contract DE-AC04-76DP-00789)
(DE93-017506; SAND-93-0390C; CONF-930676-8) Avail: CASI HC A01/MF A01

The physical state of a debris cloud generated upon impact of a thin flier plate with a thin bumper depends on the impact velocity. At impact velocities of 10km/s, the debris cloud is expected to be primarily molten with some vapor present. A series of calculations using the finite-difference code CTH has been used to evaluate the effect of phase change (i.e., higher concentrations of vapor) in debris clouds and their subsequent impact on a backwall structure. In these calculations, the higher concentrations of vapor is achieved by increasing the initial temperature of the impactor and the bumper material while keeping the same impact velocity. The nature of the interaction of the debris cloud and the subsequent loading on the backwall depends on its thermophysical state. This interaction (with a backwall) can cause either spallation, rupture, or simply bulging of the backwall structure. These results will be discussed and compared with an impact experiment performed at (approximately)10km/s on the Sandia hypervelocity launcher. In the experiment, the debris cloud was generated by the impact of a titanium plate with a titanium bumper. DOE

RECENT STUDIES OF SHORT-RANGE ORDER IN ALLOYS: THE COWLEY THEORY REVISITED
L. Reinhard and S. C. Moss (Houston Univ., TX.) Feb. 1993 34 p Presented at the John M. Crowley Symposium on Ultramicroscopy, Scottsdale, AZ, 5-8 Jan. 1993
(Contract W-7405-eng-48)
(DE93-016416; UCRL-JC-112438; CONF-9301114-2) Avail: CASI HC A03/MF A01

We present comparisons of various statistical theories for effective pair interactions (EPI) in alloys. We then evaluate these EPI's using the following methods: Cowley theory; the Krivoglaz-Clapp-Moss (KCM)

approximation; the (gamma)-expansion method (GEM) of Tokar, Masanskii, and coworkers; and the exact inverse Monte Carlo (IMC) method, introduced by Gerold and Kern. Via a series of model calculations on a hypothetical bcc alloy with a single nearest-neighbor interaction, we show that the Cowley theory is successful in evaluating the EPI's in more dilute alloys but tends to overestimate the magnitude of the nearest neighbor energy at higher concentrations, whereas the KCM expression becomes increasingly inaccurate at lower concentrations. In general, however, the approximate mean field theories are most accurate at higher concentrations and higher temperatures. Recent studies of short-range order in single crystals are discussed in which these EPI's have been evaluated using the IMC, KCM, GEM, and Cowley theories. Examples include the bcc alloy Fe(0.53)Cr(0.47) and the fcc alloys Cu(3)Au, Cu(0.69)Zn(0.31), and Ni(0.89)BgCr(0.11). In all cases the approximate expressions do quite well, especially the GEM.

A REVIEW OF THE STAGES OF WORK HARDENING
A. D. Rollett and U. F. Kocks 1993 19 p Presented at the Dislocations 1993, Assois, France, 1-9 Apr. 1993
(Contract W-7405-eng-48)
(DE93-016456; LA-UR-93-2339; CONF-9304166-1) Avail: CASI HC A03/MF A01

Stages of work hardening are reviewed with emphasis on links between each stage. Simple quantitative descriptions are given for each stage. Similarities between stage 1, easy glide, and stage 4, large strain hardening, are pointed out both in terms of magnitude of the hardening rate and of the underlying mechanism of dislocation debris accumulation. Stage 2 is described as an athermal hardening stage that occurs when statistical variations in the dislocation 'forest' lead to geometrical storage of dislocations. The steadily decreasing hardening rate observed in stage 3 is characterized by the increasing rate of loss of dislocation density due to dynamic recovery. Stage 3 appears to have an asymptote to a saturation stress which is determined by the characteristics of the dislocation tangles, or cell walls. The imperfect nature of the dynamic recovery process, however, leads to the accumulation of dislocation debris and this, by analogy with stage 1, causes the apparent saturation stress to rise, thus causing stage 4.

WETTING BEHAVIOR OF ALTERNATIVE SOLDER ALLOYS
F. M. Hosking, P. T. Vianco, C. L. Hernandez, and J. A. Rejent 1993 8 p Presented at the Static Memory Interface Conference, San Jose, CA, 1 Sep. 1993
(Contract DE-AC04-76DP-00789)
(DE93-016730; SAND-93-1063C; CONF-9309195-1) Avail: CASI HC A02/MF A01

Recent economic and environmental issues have stimulated interest in solder alloys other than the traditional Sn-Pb eutectic or near eutectic composition. Preliminary evaluations suggest that several of these alloys approach the baseline properties (wetting, mechanical, thermal, and electrical) of the Sn-Pb solders. Final alloy acceptance will require major revisions to existing industrial and military soldering specifications. Bulk alloy and solder joint properties are consequently being investigated to validate their producibility and reliability. The work reported in this paper examines the wetting behavior of several of the more promising commercial alloys on copper substrates. Solder wettability was determined by the meniscometer and wetting balance techniques. The wetting results suggest that several of the alternative solders would satisfy pretinning and surface mount soldering applications. Their use on plated through hole technology might be more difficult since the alloys generally did not spread or flow as well as the 60Sn-40Pb solder.

THE HALL-PETCH RELATIONSHIP AND MECHANISMS OF FRACTURE IN B2 COMPOUNDS
I. Baker 30 Dec. 1992 13 p
(Contract DE-FG02-87ER-45311)
(DE93-018887; DOE/ER-45311/T2) Avail: CASI HC A03/MF A01

A study was initiated in 1987 to examine structure and properties of grain boundaries in the B2 ordered alloys FeAl and NiAl. This project continued from 1990, with initial emphasis on CoAl, FeCo, and CuZn, but with continued work on FeAl and NiAl. Effect of alloy composition on structure/chemistry and properties of grain boundaries were examined by measuring yield strength vs grain size, measuring grain boundary composition using a scanning Auger electron microprobe, examining dislocation/grain boundary interactions during in-situ straining in transition electron microscopy (TEM), and determining fracture modes and assessing strain extent at fracture surfaces using selected area channeling patterns. Progress during the last 3 years is reviewed.

DEEP ION IMPLANTATION INTO MANGANIN TO MODIFY ITS PRESSURE AND ELECTROTHERMOCHARACTERISTICS
R. Wisniewski and B. Slowinski 1992 7 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-630229; JINR-E-14-92-178) Avail: CASI HC A02 (US Sales Only)

On the grounds of previously obtained experimental data concerning the high energy ((approx)1 MeV/u) Ar and Xe ions implantation into manganin, two suggestions to create the manganin based systems having improved pressure and electro-thermocharacteristics are put forward. The first way is to fabricate a multilayer system with the resultant plateau of the temperature dependence of the relative resistance much broader than the initial one. The second way comes to the formation of some manganin based self compensating structure.

EFFECTS OF IRRADIATION TEMPERATURE ON EMBRITTLEMENT OF NUCLEAR PRESSURE VESSEL STEELS
F. M. Haggag 1992 15 p Presented at the 16th Annual Symposium of the ASTM on Effects of Radiation and Materials, Denver, CO, 21-25 Jun. 1993
(Contract DE-AC05-84OR-21400)
(DE93-015428; CONF-920673-18) Avail: CASI HC A03/MF A01

The effects of neutron irradiation on the steel reactor vessel for the modular high-temperature gas-cooled reactor (MHTGR) are being investigated, primarily because the operating temperatures are low (121-288 C (250-550 F)) compared to those for commercial light-water reactors (LWR's) (approximately 288 C (550 F)). The need for design data on the reference temperature (RT(sub NDT)) shift necessitated the irradiation at different temperatures of A 533 grade B class 1 plates, A 508 class 3 forging, and welds used for the vessel shell, vessel closure head, and vessel flange. This paper presents regular- and mini-tensile, Automated Ball Indentation (ABI), and Charpy V-notch (CVN) impact test results from five irradiation capsules of this program.

This report is a guide to the literature on environmental effects on intermetallic compounds, primarily the aluminides of nickel, titanium, iron, and niobium. The guide relies heavily upon the proceedings of recent conferences. Brief technical discussions introduce the various topics and lead to specific sources of information. Various relevant review articles are also listed.

DIFFUSION IN ORDERED ALLOYS
B. Fultz, R. W. Cahn, and D. Gupta 4 Nov. 1992 272 p Symposium held in Chicago, IL, 3-4 Nov. 1992 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-92-J-1921)
(AD-A268232) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Diffusion in ordered binary alloys has been treated using the pair-approximation of the Path Probability Method (PPM) based on an atomistic model. The effect of the atomic interaction on the ordering behavior and its influence on transport properties have been clarified. Compositional dependences of both the intrinsic diffusion and interdiffusion coefficients, correlation factor, and thermodynamic factor agree very well with results from Monte Carlo simulations. The calculated properties also show qualitative agreement with the experimental data on diffusivity, activity, and creep in an NiAl system. DTIC

A BENCHMARK BENDING TEST OF A THICK SPECIMEN. PART 1: EXPERIMENTS
J. M. Finney and E. Kowal Jun. 1993 44 p
(AD-A268730; ARL-RR-6-Pt-1; DODA-AR-008-363-Pt-1) Avail: CASI HC A03/MF A01

An experiment has been undertaken to provide benchmark data for validating methods of calculating the plastic behavior of metals. In this experiment a 30 mm square-test-section specimen of 7050-T7451 aluminum alloy has been loaded in four-point bending, and the surface distortions of all four faces have been measured with the aid of a square grid pattern imposed on the surfaces before deformation. This part of the Report describes the experimental details and gives the results of the material property tests, thus providing sufficient information for the prediction of surface displacements. Part II of the Report gives the measured displacements with which predictions may be compared. DTIC

CONTINUUM MODELING OF MATERIALS THAT CAN UNDERGO MARTENSITIC PHASE TRANSITIONS
Jim M. Restuccio Jun. 1993 48 p
(Contract N00014-90-J-1871)
(AD-A268767; TR-12) Avail: CASI HC A03/MF A01

In this paper, a continuum model for materials that can undergo martensitic phase transformations is developed and applied to the study of several problems that involve such transformations. Among other things, the continuum model that is developed provides the correct material symmetry group for each phase of the material, and results in the corresponding boundary value problem being in a form that permit direct linearization, while still retaining finite shape deformations for the martensite phases. All of the problems that this continuum model is applied to in this paper deal with the issue of which phase or which variant of martensite is preferred during the growth process when a boundary traction is applied. Among these problems are the case of a uniaxial tensile traction applied to a cylindrical body and the case of a hydrostatic pressure applied to a material that has a finite shape deformation with an infinitesimal dilatation. THE LOW-TEMPERATURE SPECIFIC HEAT OF CeCu2Ge2 AT 0 AND 9.5 kbar
R. A. Fisher, J. P. Emerson, N. E. Phillips, R. Caspary (Technische Hochschule, Darmstadt, Germany.), and F. Steglich (Technische Hochschule, Darmstadt, Germany.) Apr. 1993 6 p Presented at the Conference of the International Union of Pure and Applied Physics on Low Temperature Physics (LT 20), Eugene, OR, 1-11 Aug. 1993
(Contract DE-AC03-76SF-00098)
(DE93-014914; LBL-34028; CONF-930801-4) Avail: CASI HC A02/MF A01

The compound CeCu2Ge2 is isostructural with CeCu2Si2, the first heavy-fermion superconductor. Although CeCu2Ge2 is not superconducting at zero pressure (P), it is superconducting for P greater than 70 kbar. Previous specific-heat (C) measurements for P = 0, 0.05 less than or equal to T less than or equal to 30 K, and magentic fields (H) to 8T, showed antiferromagnetic ordering at T(sub N) = 4.2 K and an anomaly in C at 0.45 K and H = 0 that was interpreted as a maximum in gamma(T). The anomaly was supressed, but not shifted in temperature, with increasing H and disappeared at H = 8T. This paper reports new data for C, 0.35 less than or equal to T less than or equal to 20 K, and P = 0. Additionally, data obtained at 9.5 kbar, the first for P not equal to 0, are reported. The P = 0 data are in excellent agreement with the earlier work suggesting that the featrures observed are intrinsic properties and not subject to the uncertainties related to sample dependence that are associated with some heavy-fermion compounds. CALCULATION OF THE LiF-CeF3-BeF2 AND LiF-PuF3-BeF2 TERNARY PHASE DIAGRAMS
R. N. R. Mulford Jul. 1993 24 p
(Contract W-7405-eng-36)
(DE93-017437; LA-12569) Avail: CASI HC A03/MF A01

The LiF-CeF3-BeF2 and LiF-PuF3-BeF2 ternary phase diagrams were calculated from optimized binary diagrams using computer programs developed by Lukas and coworkers. The approximate overall diagrams were calculated without the use of ternary interaction terms, but inclusion of ternary terms was necessary to reproduce the experimental data for solubilities of CeF3 and PuF3 which are considerably less soluble in LiF-BeF2 liquid than predicted without ternary interaction terms. MECHANISM-DEPENDENT FRACTAL CHARACTER OF FRACTURE SURFACES IN HIGH STRENGTH AND TOUGHNESS ASTM A723 STEELS Final Report
Peter McAnulty, L. V. Meisel, and P. J. Cote Jun. 1993 12 p
(AD-A268956; ARCCB-TR-93024) Avail: CASI HC A03/MF A01

The fractal character of fracture surfaces of thick-walled pressure vessels produced in the final fast fracture that terminates low cycle fatigue tests is compared with that of fracture surfaces produced in Charpy impact tests in samples of the same high strength and toughness steel (ASTM A723) alloy. Slit island analysis yielded fractal dimensions near 1.25 for the Charpy specimens, which is typical of high strength steel alloys previously studied, however, extremely high fractal dimensions near 1.40 were determined for the low cycle fatigue specimens. The distributions of island and lake areas and of island and lake perimeters on random sections exhibit hyperbolic distributions analogous to those found for geographic islands and lakes. DTIC

IMPLEMENTATION OF A NONISOTHERMAL UNIFIED INELASTIC-STRAIN THEORY INTO ADINA6.0 FOR A TITANIUM ALLOY: USER GUIDE Interim Report, Jan. - Dec. 1992
Joseph L. Kroupa and Richard W. Neu Jan. 1993 91 p
(Contract F33615-91-C-5606)
(AD-A269927; WL-TR-93-4005) Avail: CASI HC A05/MF A01

Simulations with many modern aerospace materials require realistic mechanical response models for use in isothermal and nonisothermal applications. One such model is a unified inelastic-strain theory which has been applied to capture the strain-rate sensitivity and time dependent behavior of the titanium alloy Timetal 21S (formerly B21S). The Bodner-Partom form of unified theory satisfactorily describes the B21S stress-strain response for a range of temperatures from 23 deg C and 815 deg C and strain rate from 10 3/S to 1.X10-7/S. Practical use of the theory in finite element applications depends on advanced numerical algorithms that rapidly solve the inherently 'stiff' constitutive equations. Special 'user-defined' subroutines provide the framework for the incorporation of these numerical algorithms into ADINA6.0, a general purpose finite element package. This user-guide contains a brief overview of the theory, the B21S material parameters, subroutine structure, variable nomenclature, and numerical algorithms. Test cases are described to illustrate the numerical integration schemes and provide guidance for error management. The appendices contain hard-copies of the subroutines for two- and three-dimensional elements. DTIC

POTENTIAL DEPENDENT STRUCTURAL CHANGES OF UNDERPOTENTIALLY DEPOSITED COPPER ON AN IODINE TREATED PLATINUM SURFACE DETERMINED IN SITU BY SURFACE EXAFS AND ITS POLARIZATION DEPENDENCE
G. M. Bommarito, D. Acevedo, J. F. Rodriguez, and H. D. Abruna 25 Aug. 1993 60 p
(Contract N00014-84-K-0656)
(AD-A269890; TR-33) Avail: CASI HC A04/MF A01

An in situ structural investigation of the underpotential deposition of copper on an iodine covered platinum surface (Pt/C layered synthetic microstructure (LSM) with Pt as the outermost layer) has been carried out using surface EXAFS (extended x-ray absorption fine structure) and its polarization dependence. The effects of rinsing the electrode with pure supporting electrolyte have also been investigated. At an applied potential of +0.20 V (corresponding to half a monolayer of electrodeposited copper) there are two in-plane Cu-Cu distances: 2.56+/-0.05A and 4.21+/-0.05A. This suggests a coexistence between a close-packed phase with a more open phase. It is likely that the open phase is stabilized by repulsive interactions between partially charged copper atoms, as well as by the presence of the strongly adsorbed iodine layer. At +0.10V (corresponding to a full monolayer of electrodeposited copper) there is only one Cu-Cu distance of 2.56+/-0.05A. Combining in-plane (delta polarization) and monolayer coverage, the copper UPD layer is incommensurate with respect to the platinum surface. The iodine ad-layer rides the electrodeposited copper forming a 3x3 unit cell. This interfacial structure is not altered upon rinsing with pure supporting electrolyte. DTIC

SELF-ORGANIZED CRITICALITY AND THE BARKHAUSEN EFFECT IN AMORPHOUS AND POLYCRYSTALLINE METALS Final Report
Paul J. Cote and Lawrence V. Meisel Jul. 1993 12 p
(AD-A269817; ARCCB-TR-93027) Avail: CASI HC A03/MF A01

An investigation of the possibility that the Barkhausen effect in amorphous and polycrystalline ferromagnets is an example of self-organized criticality is described. Since the theory of self-organized criticality was introduced by Bak, Tang, and Weisenfeld to explain the behavior of spatially extended, dissipative dynamical systems, the Barkhausen effect is a natural candidate for such a description. The data are consistent with self-organized critical behavior: the power spectral densities depend on frequency f as 1/f(exp 2) and the distribution of pulse energies are well described by a power law analogous to the Gutenberg-Richter law for earthquakes. Alternative explanations for power-law dependences are also presented. DTIC

DEVELOPMENT OF THE MICROSTRUCTURE BASED STOCHASTIC LIFE PREDICTION MODEL Progress Report
Marek A. Przystupa, Jimin Zhang, and Annetta J. Luevano Aug. 1993 112 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-91-J-1299)
(AD-A269742) Avail: CASI HC A06

The objective of the fatigue life prediction program at UCLA is as follows: (1) to ascertain microstructural features relevant to fatigue in aluminum 7050 alloys and develop quantitative methods for their characterizations; (2) to characterize initial microstructures and accumulation of microstructural damage during fatigue of 7050-T7451 plate alloys; and (3) to formulate and test scaling relationships and models relating relevant microstructural features to fatigue damage in aluminum 7050 alloys. Emphasis during the reporting period were on the completion of the metallographic and fractographic examinations of the high and low porosity 7050-T7451 commercial 6 in. plate alloys. Obtained results include quantification of the through thickness gradients of grain structures and volume fractions and size distributions of the constituent particles, pores, and precipitates. To our knowledge this is the most complete set of microstructural data on the 7050-T7451 commercial plate alloys. Characterizations of the fracture surfaces and microstructures of fatigued samples are in progress. Up to date results include data on the change of surface roughness and fractal dimension with fatigue crack length and preliminary information about microstructural features on the crack path. Modeling has been focused on the predictions of the size distributions of the fatigue crack initiating pores and on the incorporation of the microstructural variables into existing fatigue life prediction models. FUNDAMENTAL CONCEPTS RELATING LOCAL ATOMIC ARRANGEMENTS, DEFORMATION, AND FRACTURE OF INTERMETALLIC ALLOYS Final Report, 2 Jan. 1990 - 1 Jan. 1993
J. A. Wert Jun. 1993 171 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0143-90)
(AD-A268745; UVA/525725/MSE93/101; AFOSR-93-0654TR) Avail: CASI HC A08

This final contract report describes research activities on two topics of fundamental importance for application of intermetallic alloys as elevated temperature engineering materials: brittle fracture and creep resistance. On the topic of brittle fracture, the process of crack tip plasticity has been investigated by extending the Rice-Thomson model to treat the case of crack tip emission of dissociated superlattice dislocations that commonly occur in intermetallic alloys. The model shows that superlattice dislocation emission from crack tips can be inhibited in intermetallic alloys, and predicts the occurrence of cleavage fracture in particular intermetallic alloys. The fracture mode predictions can be compared with experimentally observed fracture modes; such comparisons for intermetallic alloys with the L12 and B2 crystal structures show that the model predictions match the experimental observations for every intermetallic alloy where sufficient data are available to perform the model calculations (about 25 alloys in all). A novel result of the dislocation emission modeling work is the finding that the antiphase boundary energy plays a central role in determining whether a particular intermetallic alloy will exhibit cleavage fracture or not. DISLOCATION-DRAG CONTRIBUTION TO HIGH-RATE PLASTIC DEFORMATION IN SHOCK-LOADED TANTALUM
D. L. Tonks, R. S. Hixson, J. N. Johnson, and G. T. Gray, III 1993 10 p Presented at the 14th International Conference of the International Association for the Advancement of High Pressure Science and Technology, Colorado Springs, CO, 27 Jun. - 2 Jul. 1993
(Contract W-7405-eng-36)
(DE93-018286; LA-UR-93-2799; CONF-930676-29) Avail: CASI HC A02/MF A01

Time-resolved plastic waves in plate-impact experiments give information on relations between applied shear stress and plastic strain rate at low plastic strain. This information is different from that obtained at intermediate strain rates using Hopkinson bar techniques because the material deformation state is driven briefly into the regime dominated by dislocation drag. Two VISAR records of particle velocity at the tantalum/sapphire (window) interface are obtained for symmetric impact producing peak in-situ longitudinal stresses of 75 and 111 kbar. Rise-times of plastic waves are about 100 and 50 ns, respectively, with peak strain rates of about 2 to 8.5 x 10(exp 5)/s, respectively, as determined by weak-shock analysis. These data show a much stronger dependence of plastic strain rate on applied shear stress than predicted by linear viscous drag models in combination with thermal activation through a large Peierls barrier. The data also show complex evolution of the mobile dislocation density during early stages of high-rate plastic flow. This measurement and corresponding analysis aid significantly in establishing the fundamental picture of dynamic deformation of metals and the evolution of the internal material state at early times following shock compression. DOE

DEFORMATION MECHANISMS IN A LAVES PHASE
Yaping Liu, S. M. Allen, and J. D. Livingston 1992 6 p Presented at the High-Temperature Ordered Intermetallic Alloys V, Boston, MA, 30 Nov. - 3 Dec. 1992
(Contract DE-FG02-90ER-45426)
(DE93-018331; CONF-9211205-3) Avail: CASI HC A02/MF A01

The stress-induced phase transformation between C36 and C15 structures in Fe2Zr is studied by electron microscopy. Nucleus of transformation is believed to be pre-existing C15 layers in C36 particles. Microstructural evidence for three mechanisms of growth of a new phase were found: fault accumulation and rearrangement; moving of individual partial dislocations between two phases; and the migration of microscopic ledges composed of a series of Shockley partials between C36 and C15. Plastic deformation by slip on non-basal planes of C36 caused by indentation is studied. DOE

MORPHOLOGY, DEFORMATION, AND DEFECT STRUCTURES OF TiCr2 IN Ti-Cr ALLOYS
K. C. Chen, S. M. Allen, and J. D. Livingston 1992 6 p Presented at the High-Temperature Ordered Intermetallic Alloys V, Boston, MA, 30 Nov.

- 3 Dec. 1992
(Contract DE-FG02-90ER-45426)
(DE93-018332; CONF-9211205-4) Avail: CASI HC A02/MF A01

The morphologies and defect structures of TiCr2 in several Ti-Cr alloys have been examined by optical metallography, x-ray diffraction, and transmission electron microscopy (TEM) in order to explore the room-temperature deformability of the Laves phase TiCr2. The morphology of the Laves phase was found to be dependent upon alloy composition and annealing temperature. Samples deformed by compression have also been studied using TEM. Comparisons of microstructures before and after deformation suggest an increase in twin, stacking fault, and dislocation density within the Laves phase, indicating some but not extensive room-temperature deformability. DOE

EFFECTS OF SHOCK LOADING ON A SOLID-SOLUTION STRENGTHENED SUPERALLOY
K. S. Vecchio and G. T. Gray, III 1993 5 p Presented at the 14th International Conference of the International Association for the Advancement of High Pressure Science and Technology, Colorado Springs, CO, 27 Jun. - 2 Jul. 1993
(Contract W-7405-eng-36)
(DE93-018345; LA-UR-93-2290; CONF-930676-17) Avail: CASI HC A01/MF A01

Ni-based HAYNES(reg sign) 230(trademark) ALLOY has been studied to determine the effect of shock loading on post-shock quasistatic and dynamic mechanical response and microstructural evolution. Compression properties of this material was studied in both the as-received and shock-loaded conditions at strain rates from 10(exp -3)/s to 3000/s and 77 and 293K. Damage evolution was documented via TEM and correlated with observed mechanical response. Changes in deformation mechanisms and second phase distributions resulting from shock pre-straining and subsequent testing are correlated with changes in strain hardening behavior. Comparison of these results with shock loading results on pure Ni revealed distinct differences in strengthening and defect storage mechanisms. DOE

EFFECT OF INTERNAL HEATING DURING HOT COMPRESSION TESTING ON THE STRESS-STRAIN BEHAVIOR AND HOT WORKING CHARACTERISTICS OF ALLOY 304L
M. C. Mataya and V. E. Sackschewsky 1993 80 p Presented at the Fall Meeting of the Minerals, Metals and Materials Society: Physical Metallurgy and Materials in Conjunction with Materials Week and the Materials Applications and Services Exposition, Pittsburgh, PA, 17-21 Oct. 1993
(Contract DE-AC34-90DP-62349)
(DE93-012701; RFP-4739; CONF-931009-1) Avail: CASI HC A05/MF A01

Temperature change from conversion of deformation to internal heat, and its effect on stress-strain behavior of alloy 304L was investigated by initially isothermal (temperature of specimen, compression dies, environment equilibrated at initiation of test) uniaxial compression. Strain rate was varied 0.01 s(sup (minus)1) to 1 s(sup (minus)1) (thermal state of specimen varied from nearly isothermal to nearly adiabatic). Specimens were deformed at 750 to 1150 to a strain of 1. Change in temperature with strain was calculated via finite element analysis from measured stress-strain data and predictions were confirmed with thermocouples to verify the model. Temperature increased nearly linearly at the highest strain rate, consistent with temperature rise being a linear function of strain (adiabatic). As strain rate was lowered, heat transfer from superheated specimen to cooler dies caused sample temperature to increase and then decrease with strain as the sample thinned and specimen-die contact area increased. As-measured stress was corrected. Resulting isothermal flow curves were compared to predictions of a simplified method suggested by Thomas and Shrinivasan and differences are discussed. Strain rate sensitivity, activation energy for deformation, and flow curve peak associated with onset of dynamic recrystallization were determined from both as-measured and isothermal stress-strain data and found to vary widely. The impact of utilizing as-measured stress-strain data, not corrected for internal heating, on results of a number of published investigations is discussed. DOE

DYNAMICAL BEHAVIOR OF TANTALUM
M. D. Furnish, L. C. Chhabildas, and D. J. Steinberg (Lawrence Livermore National Lab., CA.) 1993 3 p Presented at the 14th International Conference of the International Association for the Advancement of High Pressure Science and Technology, Colorado Springs, CO, 27 Jun. - 2 Jul. 1993
(Contract DE-AC04-76DP-00789)
(DE93-017877; SAND-93-0427C; CONF-930676-10) Avail: CASI HC A01/MF A01

The authors have performed four dynamic impact tests on tantalum to determine its high-pressure yield and viscoelastic properties. Their experiments used compressed gas gun techniques to produce a combination of shocks, reshocks, and releases over the pressure range 0-12 GPa in samples 5.0 and 7.3 mm thick. Profiles were recorded using VISAR (velocity interferometry) techniques. Elastic precursors suggest a yield strength of 0.95 GPa, which is somewhat above literature values. As with other metals, release waves do not show a perfect elastic-plastic behavior, indicating a slight Baushinger effect. Lagrangian sound velocities for singly shocked states are consistent with earlier results (about 4.5 km/sec). DOE

THE INTELLIGENT PROCESSING OF MATERIALS Final Technical Report, 24 Jan. 1986 - 14 Nov. 1991
Brian G. Kushner 19 Aug. 1993 55 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F49620-86-C-0036; ARPA Order 5636; AF Proj. 5636)
(AD-A269250; AFOSR-93-0673TR) Avail: CASI HC A04

This report covers progress in novel concepts for the development and implementation of intelligent processing of materials (IPM) in the production of advanced materials, with special emphasis on defense applications. IPM is inherently a multidisciplinary effort, combining the latest in materials processing knowledge in the form of process models; novel, in-situ process sensors; and emerging control theory for adaptive control of highly nonlinear processes. The concepts reported below have been studied to assess their value in streamlining the development of new methods for establishing regions of process variable space which are inherently stable, thereby reducing the laborious and experimentally intensive task of process design for production of advanced materials, and to a distributed simulation environment known as the Virtual Factory for rapid prototyping of intelligent control systems, which was originally developed in a parallel research project sponsored by ARPA through NIST. Finally, these new techniques, concepts, and capabilities have been applied to the processing of advanced materials for military applications, including near net shape forming of titanium alloy powders to form shaped parts representative of gas turbine engine components and the growth of single crystal infrared detector materials based upon cadmium zinc telluride, which is the substrated material for infrared focal plane arrays. These efforts have been conducted by BDM scientists and engineers, in conjunction with leading university research from MIT and the University of California, Santa Barbara (UCSB). DTIC

DEVELOPMENT OF DUCTILE Fe3Al-BASED ALUMINIDES
C. G. McKamey, V. K. Sikka, and G. M. Goodwin 1993 10 p Presented at the 7th Annual Conference on Fossil Energy Materials, Oak Ridge, TN, 11-13 May 1993
(Contract DE-AC05-84OR-21400)
(DE93-017865; CONF-9305135-8) Avail: CASI HC A02/MF A01

Iron aluminides based on Fe3Al are of interest because of their excellent oxidation and corrosion resistance, especially in sulfur-bearing atmospheres. Work at ORNL has centered on developing Fe3Al-based alloys with improved ambient temperature ductilities and increased strengths at temperatures of 600-700 C. Ambient temperature brittleness in this system is not 'inherent,' but is caused by atomic hydrogen which is produced by an environmental reaction between aluminum in the alloy and water vapor in the atmosphere. Great strides have been made in understanding this embrittlement phenomenon, and the production of alloys with room temperature ductilities of over 10% and tensile yield strengths at 600 C of as high as 500 MPa is now possible through modifications in alloy composition and control of thermomechanical processing techniques. Creep rupture lifes of over 200 h at 593 C (1100 F) and 207 MPa (30 ksi) can also be produced through control of alloy composition and microstructure. This paper summarizes our present efforts to improve the tensile and creep rupture properties and gives the status of efforts to commercialize Fe3Al-based alloy compositions. DOE

ELECTRON IMPACT EXCITATION OF COPPER ATOMS
B. J. Stumpf (Idaho Univ., Moscow.) 1993 13 p
(Contract W-7405-eng-48)
(DE93-017995; UCRL-CR-113452) Avail: CASI HC A03/MF A01

The optical excitation function method has been used in a crossed atom and electron beam arrangement to measure the electron impact cross section of the copper 4(sup 2)P to 4(sup 2)S resonance lines (324.8, 327.4 nm) from threshold (3.8 eV) to 8 eV. Relative experimental cross section data are normalized at an energy of 1000 eV with respect to first Born theory that includes the 4(sup 2)S to 4(sup 2)P resonance transition with an oscillator strength of 0.652 and cascading from the (3d(sup 10)nd)(sup 2)D states with n = 4, ...10. The measured Cu 4(sup 2)S(sup 4) to 4(sup 2)P cross section is compared with recent theoretical calculations in close-coupling approximation. Very good agreement is found with the ten-state close-coupling theory of Scheibner. DOE

ENVIRONMENTAL DEGRADATION OF ALLOY 600 AND WELDED FILLER METAL EN82 IN AN ELEVATED TEMPERATURE AQUEOUS ENVIRONMENT
G. L. Webb 1993 8 p Presented at the 6th International Symposium on Environmental Degradation of Materials in Nuclear Power Systems: Water Reactors, San Diego, CA, 3-5 Aug. 1993
(Contract DE-AC11-89PN-38014)
(DE93-018049; WAPD-T-2989; CONF-930825-4) Avail: CASI HC A02/MF A01

The stress corrosion cracking (SCC) behavior of Alloy 600 and welded nickel base filler metal EN82 in high temperature water was investigated. A regression model was developed to show the effects of stress and temperature on SCC initiation for Alloy 600 tubing. An activation energy of 50.6 kcal/mole and a stress exponent of -5.7, applicable to these heats of low temperature mill annealed tubing, were determined from the regression analysis. Data are also presented on the SCC behavior of other classes of materials, including low temperature thermally treated tubing, hot worked and annealed ring forgings, and EN82 weld metal in relation to the tubing data. DOE

INTELLIGENT MATERIALS SYSTEMS AND STRUCTURES. PART 4: THE INFLUENCE OF THERMOMECHANICAL LOADING ON THE LIFE OF SHAPE MEMORY ALLOYS [INTELLIGENTA MATERIALSYSSTEM OCH STRUKTURER. DEL 4: INVERKAN AV TERMOMEKANISK BELASTNING PA MINNESMETALLERS LIVSLANGD]
S. Tiensuu Mar. 1993 37 p In SWAHILI See also PB92-219195
(PB93-195923; FOA-C-20923-8.4-Pt-4) Avail: CASI HC A03/MF A01

The report begins with a short presentation of the shape memory alloy phenomenon, including its history and terminology. After introductory comments the investigation of a NiTi wire is described. To study fatigue and changes in properties during thermomechanical loading, measurements of strain and cycles to failure were measured as a function of stress. This entailed construction of an experimental apparatus, which is described. Other properties, including transformation temperatures, electrical resistivity and microstructure were measured before and after fatigue testing to further investigate the influence of thermomechanical loads on a shape memory alloy. Room-temperature tensile properties of as-cast Fe3Al, Fe3Al with chromium, and Fe3Al-based FA-129 alloy are investigated. Tensile properties were obtained in the as-cast condition and after homogenization at 700, 900, and 1200 C. Transmission electron microscopy (TEM) was used to characterize ordered phases, and optical metallography and scanning electron microscopy (SEM) were used to characterize the microstructure and fracture morphology. The results indicate that the low ductility of as-cast Fe3Al-based alloys may be related to the relatively large grain size in the cast condition, the low dislocation density in as-cast samples, and the presence of the D0(sub 3) ordered phase. Homogenized samples of FA-129 alloy exhibited almost twice the ductility of the as-cast condition. Microstructural characterization of the homogenized samples and comparison of the as-cast and homogenized microstructures may provide a clue to the poor ductility in the as-cast state. DOE

RESONANCE RAMAN AND PHOTOPHYSICAL STUDIES OF TRANSITION METAL COMPLEXES IN SOLUTION AND ENTRAPPED IN ZEOLITES
J. R. Kincaid 1993 11 p
(Contract DE-FG02-86ER-13619)
(DE93-019892; DOE/ER-13619/7) Avail: CASI HC A03/MF A01

A study of the effects of entrapment of ruthenium(2)-polypyridyl complexes within the supercages of Y-zeolite is discussed. Results of initial studies document alterations in photophysical properties of entrapped complexes and provide insight into the factors responsible for these changes. A second major activity was to undertake an investigation of the feasibility of entrapment of metallophthalocyanines within the Y-zeolite supercages. The initial problems with the preparative methodology used for these systems have been overcome and several systems have now been prepared and purified for projected photoredox studies. A third major objective was to develop and utilize a sound interpretive framework for resonance Raman (RR) and time-resolved RR (TR(sup 3)) methods for investigating subtle perturbations in ground- and (sup 3)MLCT-state electronic structure which might be induced by substituent or environmentally-induced asymmetry, effects which could possibly lead to critical functional alterations. THE EFFECTS OF RADIOLYSIS ON THE CORROSION AND STRESS CORROSION BEHAVIOR OF 316 STAINLESS STEELS
D. J. Duquette and D. Steiner 1993 14 p
(Contract DE-FG02-89ER-52161)
(DE93-019933; DOE/ER-52161/5) Avail: CASI HC A03/MF A01

This program is focused on the corrosion, stress corrosion, and corrosion fatigue behavior of Type 316 stainless steel (316SS) at 50, 90, and 130 C in high-purity water. Irradiated solution tests are performed using high-energy photon radiation. Purpose of this work is to determine the effects of radiolysis products on the environmental stability of 316SS in support of the ITER first wall/shield/blanket design. Preliminary results suggest that irradiation of pure water at 50 C results in a shift in the electrochemical potential for 316SS of approximately 100mV in the active direction and nearly an order of magnitude increase in the passive current density as compared to non-irradiated conditions. This proposal outlines a three-year program to develop corrosion design criteria for the use of 316SS in an ITER environment. DOE

BERYLLIUM PROCESSING TECHNOLOGY REVIEW FOR APPLICATIONS IN PLASMA-FACING COMPONENTS
R. G. Castro, L. A. Jacobson, and P. W. Stanek Jul. 1993 27 p
(Contract W-7405-eng-36)
(DE93-018396; LA-12545-MS) Avail: CASI HC A03/MF A01

Materials research and development activities for the International Thermonuclear Experimental Reactor (ITER), i.e., the next generation fusion reactor, are investigating beryllium as the first-wall containment material for the reactor. Important in the selection of beryllium is the ability to process, fabricate and repair beryllium first-wall components using existing technologies. Two issues that will need to be addressed during the engineering design activity will be the bonding of beryllium tiles in high-heat-flux areas of the reactor, and the in situ repair of damaged beryllium tiles. The following review summarizes the current technology associated with welding and joining of beryllium to itself and other materials, and the state-of-the-art in plasma-spray technology as an in situ repair technique for damaged beryllium tiles. In addition, a review of the current status of beryllium technology in the former Soviet Union is also included. DOE

A FREE ENERGY SIMULATION METHOD BASED STUDY OF INTERFACIAL SEGREGATION
D. J. Srolovitz 18 May 1993 2 p
(Contract DE-FG02-88ER-45367)
(DE93-019462; DOE/ER-45367/5) Avail: CASI HC A01/MF A01

Binary alloys were investigated. Segregation to and thermodynamics of twist grain boundaries in Cu-Ni were studied. Segregation to and order-disorder phase transitions at grain boundaries in ordered Ni3(-x)Al(1+x) were also investigated. Order-disorder transitions at and segregation to the (001), (011), and (111) surfaces in Pd-Cu, Pd-Ag, and Pd-Au alloys were investigated. The (001) surface in Cu-rich alloys undergoes a surface phase transition from disordered to ordered surface phase upon cooling from high temperature, similar to the (001) surface transition in Ni-rich Pt-Ni alloys. Segregation and ordering appear to be correlated. The free energy minimization method was also used to calculate the heat of formation and lattice parameter of Ag-Cu metastable phases. Results of free energy minimization for free energy and entropy of Si agree with experiment and quasiharmonic calculations. DOE

HIGH DOSE EFFECTS IN NEUTRON IRRADIATED FACE-CENTERED CUBIC METALS
F. A. Garner and M. B. Toloczko (California Univ., Santa Barbara.) Jun. 1993 47 p Presented at the Time Dependence of Radiation Damage Accumulation and Its Impact on Material Properties, Montreau (Switzerland), 14-21 Oct. 1993
(Contract DE-AC06-76RL-01830)
(DE93-017671; PNL-SA-21235; CONF-9310133-1) Avail: CASI HC A03/MF A01

During neutron irradiation, most face-centered cubic metals and alloys develop saturation or quasi-steady state microstructures. This, in turn, leads to saturation levels in mechanical properties and quasi-steady state rates of swelling and creep deformation. Swelling initially plays only a small role in determining these saturation states, but as swelling rises to higher levels, it exerts strong feedback on the microstructure and its response to environmental variables. The influence of swelling, either directly or indirectly via second order mechanisms, such as elemental segregation to void surfaces, eventually causes major changes, not only in irradiation creep and mechanical properties, but also on swelling itself. The feedback effects of swelling on irradiation creep are particularly complex and lead to problems in applying creep data derived from highly pressurized creep tubes to low stress situations, such as fuel pins in liquid metal reactors. MODELING OF THE FORMATION OF MICROPOROSITY IN ALLOYS
F. C. Chang and H. L. Tsai (Missouri Univ., Rolla.) 1993 6 p Presented at the 1993 Chinese American Academic and Professional Convention, Chicago, IL, 2-5 Jul. 1993
(Contract W-31-109-eng-38)
(DE93-017733; ANL/ET/CP-78882; CONF-930796-3) Avail: CASI HC A02/MF A01

A complete mathematical model, consisting of a continuum model and a gas evolution model, was established for the prediction of shrinkage- and gas-caused porosity in castings. The model allows simultaneous calculation of transient temperature, velocity, pressure, and porosity distributions in a solidifying casting. Fluid flow caused by both natural convection and solidification contraction, as well as change of global domain due to shrinkage, were considered. A parametric study was performed to investigate the effects of various solidification variables in the formation of microporosity, including the use of chilling, initial gas content, characteristics of heat transfer between the casting and the mold, casting size, and riser height. It was found that a low initial gas content in the molten metal and casting conditions that facilitate solidification-rate decrease the formation of microporosity. The calculated porosity distribution in 1% Cr-steel alloys compares favorably with published experimental data. DOE

BINDING OF COPPER TO NANOCAVITY SURFACES IN SILICON
S. M. Myers, D. M. Follstaedt, and D. M. Bishop 1993 10 p Presented at the 17th International Conference on Defects in Semiconductors, Gmunden, Austria, 18-23 Jul. 1993
(Contract DE-AC04-76DP-00789)
(DE93-019073; SAND-93-0244C; CONF-9307124-1) Avail: CASI HC A02/MF A01

We demonstrate that nanometer-scale voids within Si, formed by He ion implantation and annealing, trap Cu atoms with a binding energy of 2.2 +/- 0.2 eV relative to solution. This trapping saturates at a level consistent with monolayer coverage of the cavity walls, and it is ascribed to the reaction of Cu with Si dangling bonds on the internal surfaces. Our experiments also confirm the previously reported solution enthalpy of Cu in Si relative to precipitated Cu3Si, 1.7 eV, so that the binding at cavity traps is stronger. It is proposed that nanocavities may provide superior gettering of metallic impurities in Si. DOE

METALLURGICAL EVALUATION OF SRAM 2/SRAM A PROGRAM MER BASE PLATES
B. K. Damkroger, M. C. Maguire, and C. V. Robino May 1993 65 p
(Contract DE-AC04-76DP-00789)
(DE93-018689; SAND-93-0763) Avail: CASI HC A04/MF A01

Ten MC4073/4369 programmer base plates were analyzed. This component, a programmer base plate for the SRAM II (and later the SRAM A), is specified as a Grade C quality casting made of aluminum Alloy A356, heat treated to the T6 condition. A concern was expressed regarding the choice of an A356 casting for this application, given the complexity and severity of the loading environment. Preliminary tests and analyses suggested that the design was adequate, but noted the uncertainty involved in a number of their underlying assumptions. The uncertainty was compounded by the discovery that the casting used in the original series of mechanical tests failed. In this investigation, several production castings were examined and found to be of a quality superior to that required under current specifications. Their defect content and microstructure were studied and compared with published data to establish a mechanical property data base. The data base was supplemented with a series of X-direction static tests, which characterized the loading environment and measured the overall casting performance. It was found that the mechanical properties of the supplied castings were adequate for the anticipated X-direction loading environment, but the component is not over-designed. The established data base further indicates that a reduction in casting quality to the allowable level could result in failure of the component. Recommendations were made including (1) change the component specification to require higher casting quality in highly stressed areas, (2) supplement the inspection procedures to ensure adequate quality in critical regions, (3) alter the component design to reduce the stress levels in the mounting feet, (4) substitute a modified A356 alloy to improve the mechanical properties and their consistency, and (5) more thoroughly establish a data base for the mechanical property consequences of levels and configurations of casting defects. DOE

PREDICTION OF NON-EQUILIBRIUM SOLIDIFICATION MODES IN AUSTENITIC STAINLESS STEEL LASER WELDS
J. M. Vitek and S. A. David 1993 37 p Presented at the Annual Meeting of the Metallurgical Society, Denver, CO, 21-25 Feb. 1993
(Contract DE-AC05-84OR-21400)
(DE93-018457; CONF-930202-11) Avail: CASI HC A03/MF A01

A primary austenitic, non-equilibrium mode of solidification can be induced in many 300 series austenitic stainless steels by laser welding and other rapid solidification techniques. The change in solidification mode can often result in a fully austenitic microstructure compared to the two phase ferrite plus austenite microstructure that is commonly found after primary ferrite solidification. A predictive capability for the solidification mode under rapid solidification conditions such as laser welding is needed since the microstructure and properties are closely related to solidification behavior. Conventional constitutional diagrams do not predict with any reliability the change to non-equilibrium austenitic solidification mode. Several means that have been attempted to predict the solidification behavior under extreme conditions are reviewed. The Cr(sub EQ)/Ni(sub EQ) ratio is shown to be unreliable, at least with the equivalence factors commonly used. Theoretical calculations of growth rate competition between ferrite and austenite solidification show promise, but some ambiguity results from inaccuracy in thermophysical material parameters. Use of calculated thermodynamic parameters such as equilibrium and non-equilibrium liquidus and solidus temperatures also shows some promise. However, this approach is not completely satisfactory and reliable either. It is concluded that a reliable and accurate method for predicting the tendency of austenitic stainless steels to solidify in the non-equilibrium mode is not yet available. DOE

MOLECULAR DYNAMICS MODELING OF THE MECHANICAL BEHAVIOR OF METALLIC MULTILAYERS
J. Belak and D. B. Boercker Apr. 1993 7 p Presented at the 205th American Chemical Society National Meeting, Denver, CO, 28 Mar. - 2 Apr. 1993
(Contract W-7405-eng-48)
(DE93-017972; UCRL-JC-112347; CONF-930304-31) Avail: CASI HC A02/MF A01

Constant-stress molecular dynamics simulations are used to study the mechanical properties of equal concentration Cu-Ni (111) metallic multilayers of repeat lengths 0.4-0.5 nm. Uniaxial stress is applied along the close-packed and perpendicular to the close-packed directions within the (111) plane. The observed elastic moduli do not display a supermodulus effect as observed in experimental bulge tests for the biaxial modulus. However, both the average interlayer spacing and the out-of-plane Poisson ratio display anomalous effects for multilayer repeat lengths below about two nanometers. DOE

(Contract DE-AC05-84OR-21400)
(DE93-017862; CONF-9305135-9) Avail: CASI HC A03/MF A01

The low room-temperature ductility of Fe3Al-based alloys is associated with their environmental embrittlement. Reducing the aluminum level from 29 to 16 at. % has been found to be an effective method in essentially eliminating the environmental embrittlement effect and increasing the room-temperature ductility value to over 25%. This paper will present data on alloy compositions, melting, casting and processing methods, and mechanical properties. Plans for future work on these alloys will also be described. DOE

THE EFFECT OF COMPOSITION ON THE MECHANISM OF CONTINUOUS RECRYSTALLIZATION AND SUPERPLASTIC RESPONSE OF ALUMINUM-SCANDIUM ALLOYS Ph.D. Thesis
E. L. Bradley, III May 1993 102 p
(Contract DE-AC03-76SF-00098)
(DE93-018594; LBL-34291) Avail: CASI HC A06/MF A02

Continuous recrystallization (CRX) seems to be fundamental in Al-Sc because it occurs irrespective of solute composition. It appears to be due to a combination of subgrain coalescence at low strains and incorporation of additional dislocations generated during grain boundary sliding at higher strains when the misorientation has increased sufficiently. Alloying additives such as Mg and Li are more important with respect to deformation after CRX is completed. Mg, and to a lesser extent Li, affect the max m-values (strain-rate sensitivities) in Al-Sc by changing the melting points (mp). Max m-values correlate inversely with mp so that the alloy with the greatest Mg had the highest m-values and lowest mp; the stress is raised at which power-law creep and breakdown occurs. The power-law breakdown at much lower stresses in Al-0.5Sc and Al-1.2Li-0.5Sc causes the m-value to decrease more rapidly with strain rate. Al alloys for commercial superplastic applications should contain elements that raise the power-law strength so that the m-values are maximized while preserving the post-formed mechanical properties. DOE

THE MICROSTRUCTURAL MECHANISM OF ELECTROMIGRATION FAILURE IN NARROW INTERCONNECTS OF Al ALLOYS Ph.D. Thesis
Choongun Kim Apr. 1993 203 p
(Contract DE-AC03-76SF-00098)
(DE93-018598; LBL-34189) Avail: CASI HC A10/MF A03

This thesis reports a study of the mechanism of electromigration failure in Al-2Cu-1Si thin-film conducting lines on Si. Samples were patterned from 0.5 micron thick vapor-deposited films with various mean grain sizes (G). The samples had line widths (W) of 1.3, 2, 4 and 6 microns. The lines were aged at various conditions to change the Cu-precipitate distribution and were tested to failure at T = 225 C and j = 2.5 x 10(exp 6) A/sq cm. Some samples were tested over a range of substrate temperatures, current densities, and current reversal times. Aging produces an initially dense distribution of metastable theta' (Al2Cu; coherent) in the grain interiors, with stable theta (Al2Cu; incoherent) at the grain boundaries. The intragranular theta' is gradually absorbed into the grain boundary precipitates. In the wide lines, the mean time to failure increases slowly and monotonically with pre-aging time and current reversal time. The failure mode is the formation and coalescence of voids that form on grain boundaries with an apparent activation energy of 0.65 eV. In the narrow lines, the lines failed by a transgranular-slit mechanism with an activation energy near 0.93 eV. The distribution of the polygranular segments and the kinetics of failure varies with the linewidths. Failure occurs after Cu has been swept from the grains that fail. Pre-aging the line to create a more stable distribution of Cu significantly increases the time to failure. When the density of intragranular theta-phase precipitates is maximized, the transgranular-slit failure mechanism is suppressed, and the bamboo grain fails by diffuse thinning to rupture. The results from the current reversal test indicate that the time to sweep Cu in the polygranular segments is longer for longer polygranular segments. Thus the time to first failure in an array of lines is much longer than predicted by a log-normal fit to the distribution of failure times. DOE

THE APPLICATIONS OF MODIFIED METALS IN THE CONSTRUCTION INDUSTRY [MODIFIOITUJEN METALLIEN KAEYTTOESOVELLUTUKSET RAKENNUSTEOLLISUUDESSA]
Jaakko Salmi, Paavo Hassinen, and Pertti Auerkari Feb. 1992 45 p In FINNISH Sponsored by Technical Research Centre of Finland, Espoo
(VTT-TIED-1329; ISBN-951-38-4142-1; ETN-93-94471) Copyright Avail: CASI HC A03/MF A01

The properties of metal matrix composites, bimetals and memory metals are presented and applications in construction industry are discussed. Bimetals are already widely used in thermal switches and relays as well as in components in measuring instruments which react to temperature changes. Memory metals are used in various pipe and electrical connectors and in control devices for ventilation windows and air conditioners. Most applications of metal matrix composites have been in space, aircraft and defense industries. However, now the prices of the materials are falling, while their use is growing and extending, and finding applications in other branches too is becoming feasible. The applications presented are not ready products, though they could give useful indications for applications where the properties of traditional materials are inadequate. ESA

Work done to formulate the realistic models for the numerical simulation of deep drawing is reported. These models must be mechanically consistent and sufficiently simple in their formulation and identification. This work is developed within the framework of rigid plasticity in plasma stress, which is a suitable approximation for sheet metal forming. Three classes of models were developed taking into account the initial anisotropy of the material together with isotropic hardening. Attention is restricted to the transverse isotropic case. This work was done as a part of a joint project on constitutive equation for deep drawing. The first class of models is relatively classic and permits the correct description of some radial stress paths taking into account the anisotropy coefficient, by using a non-associated flow rule. The principal contribution consists in developing an identification strategy and together with the appropriate numerical schemes starting from existing experiments results. The second class of models allows modification of the description of some experimental results and specially the plane traction by introducing new internal variables hardening more or less related to the microstructural (mean free path). For the description of subsequent behavior following a change in the loading trajectory (complex loading), a model which uses an internal tensorial variable was developed. The third class of models is based on the utilization of a nonquadratic criterium. A general methodology of representation of plane stress isotropic and transversly isotropic criteria was developed. The application of this representation to a nonquadratic criterium and a nonassociated flow rule allows the construction of models which give a good description of radial loading and anisotropy. ESA

NI-AL2O3 SOLID STATE BINDING: ELABORATION, STATE OF THERMAL CONSTRAINTS, MECHANICAL BEHAVIOR Ph.D. Thesis [LES LIAISONS NI-AL2O3 A L'ETAT SOLIDE: ELABORATION, ETAT DES CONTRAINTES THERMIQUES, COMPORTEMENT MECANIQUE]
Pierre Lourdin 1992 161 p In FRENCH
(ECL-92-31; ETN-93-94591) Avail: CASI HC A08/MF A02

Nickel-alumina chemical bindings are prepared by thermal compression in the solid state and submitted to tensile and four point flexion tests. Several physical-chemical mechanisms to explain bindings are considered. The quality of the contact between the two materials depends on the plastic strain of the metal. The formation of an interface is associated with the behavior of secondary phases found in ceramics. Recent developments of brittle two phase materials allowed to characterize the interface's fracture energy, which was found to be 40 J sq m. The feasibility and the mechanical resistance of a metal/ceramic assembly depend on the thermal stresses state. The available models are not satisfactory, and a new model to describe the thermal stress level is proposed. It takes into account the speed of cooling and describes quite accurately the stress state after creep tests. ESA

INCOLOY 908 DATABASE REPORT: ON PROCESS-STRUCTURE-PROPERTY RELATIONSHIP
L. S. Toma, I. S. Hwang, and M. M. Steeves May 1993 39 p
(Contract DE-FC02-93ER-54186)
(DE93-017616; DOE/ER-54186/T1; PFC/RR-93-2) Avail: CASI HC A03/MF A01

Incoloy 908 is a nickel-iron base superalloy with a coefficient of expansion (COE) and mechanical properties that have been optimized for use in Nb3Sn superconducting magnets. It has been proposed for use as a conduit material for the International Thermonuclear Experimental Reactor (ITER) magnets. The relationship between manufacturing processes, microstructures, and mechanical properties of Incoloy 908 are characterized in support of the magnet fabrication and quality control. This report presents microhardness, microstructure, and yield and ultimate tensile strengths as functions of thermomechanical process variables including heat treatment, annealing, and cold work for laboratory prepared Incoloy 908 specimens. Empirical correlations have been developed for the microhardness at room temperature and tensile strength at room temperature and at 4K. These results may be used for manufacturing quality control or for design. DOE

USE OF SHAPE MEMORY ALLOYS IN THE ROBUST CONTROL OF SMART STRUCTURES Final Report, Feb. 1990 - Jun. 1993
Vittal S. Rao, Thomas J. OKeefe, and Leslie R. Koval Aug. 1993 134 p
(Contract DAAL03-90-G-0053)
(AD-A270827; ARO-27686.11-EG-SM) Avail: CASI HC A07/MF A02

This report details an integrated interdisciplinary approach for designing and implementing robust controllers on smart structures. The application of shape memory alloy materials as actuators and sensors in the active control of smart structures has been investigated. A process was developed for the electrodeposition of In-Tl alloys in a composition range where this system exhibits the shape memory effect. Cu-Zn, Au-Ca, and In-Cd alloy films were produced using the electrolytic techniques and their shape memory properties evaluated. To demonstrate some of the capabilities of smart structures and to determine the limitations imposed by hardware realizations, we have designed and fabricated experimental test articles incorporating flexible structures with SMA actuators, strain gauge sensors, signal processing circuits and digital controllers. Structural identification techniques have been employed in determining mathematical models of test articles from experimental data. A modified robust control design methodology was developed to accommodate the limited control force provided by the SMA actuators. The robustness properties of closed loop structural systems were verified experimentally. Adaptive control methods were implemented. Neural network based identification and control algorithms were developed. DTIC

DEVELOPMENT AND CHARACTERIZATION OF ADIABATIC SHEAR PRONE TUNGSTEN HEAVY ALLOYS Final Report, 1 Oct. 1991 - 31 Jan. 1993
Aniimesh Bose, James Lankford, Jr., and Herve Couque Jul. 1993 81 p
(Contract DAAL04-91-C-0065)
(AD-A270477; SwRI-06-4601; ARL-CR-60) Avail: CASI HC A05/MF A01

Depleted uranium (DU) is currently the top-performing kinetic energy penetrator, followed closely (but not matched) by several tungsten heavy alloy variants. Because of the adverse environmental impact associated with DU, it is extremely desirable to determine a means of upgrading the ballistic performance of heavy alloys to a level at least comparable to that of DU. It is thought that the reason for the improved ballistic performance of DU-0.75 Ti alloy is embedded in its ability to self sharpen during armor penetration, and it is further postulated that this self-sharpening ability is due to the susceptibility of DU to adiabatic shear during penetration events. The contrasting inability of current tungsten heavy alloys to localize shear during penetration causes mushrooming at the head of the projectile, thus, decreasing the depth of penetration. Consequently, there is a great urgency to develop new tungsten alloys that will exhibit localized, unstable shear failure, and associated self sharpening during armor penetration. DTIC

COMMERCIALIZATION EFFORT IN SUPPORT OF ELECTROSLAG-CASTING TECHNOLOGY
V. K. Sikka Jun. 1993 37 p
(Contract DE-AC05-84OR-21400)
(DE93-017988; ORNL/TM-12341) Avail: CASI HC A03/MF A01

This report summarizes the results of an effort to revive interest in the electroslag casting (ESC) of components in the United States. The ESC process is an extension of a well established electroslag-remelting (ESR) process. Both processes use the electrode of a material that is continuously melted and cast in a water-cooled copper mold. For simple shapes, the mold can be movable, allowing the continuous casting of long lengths. In an effort to revive U.S. industries' interest in ESC, the following approaches were taken: U.S. industries with prior experience in ESC or currently operating an ESR unit were contacted, followed up with telephone conversation, and/or sent copies of prior published reports on the topic, and, in some cases, personal visits were made; with two companies, a potential interest in ESC was worked out by initially conducting ESR; and to further strengthen the industrial interest, the newly developed iron-aluminide alloy, FA-129, was chosen as the material of choice for this study. The two industrial companies that worked with ORNL were Special Metals Corporation (New Hartford, New York) and Precision Rolled Products, Inc. (PRP, Florham Park, New Jersey). Even with its advantages, a survey of the industry indicated that ESC technology has a very limited chance of advancement in the United States. However, the processing of rounds and slabs by the ESR process is a well established commercial technology and will continue to expand. DOE

DAMPING IN FERROUS SHAPE MEMORY ALLOYS Final Report
L. M. Schetky, M. H. Wu, C. Y. Lei, C. M. Wayman, and M. Wuttig Aug. 1993 64 p
(Contract N00014-90-C-0076)
(AD-A271009) Avail: CASI HC A04/MF A01

The damping properties of Fe-Mn-Si, Fe-Ni-Co-Ti, and Fe-Al-C alloy systems were examined by DMTA (Dynamic Mechanical Thermal Analyzer) and oscillation methods. The martensite transformations and microstructures were studied and examined by transition electron microscopy (TEM), resistivity, and DSC. High damping was found in Fe-Mn-Si and Fe-Ni-Co-Ti alloys with microstructures containing glissile inter-variant martensite interfaces, while those with sessile inter-variant martensite interfaces exhibit lower damping. The general agreement between the damping peaks and transformation temperatures further confirms the close relations between high damping and shape memory behavior. DTIC

SCREENING ANALYSIS FOR CHLORINE-FREE ALTERNATIVE REFRIGERANTS TO REPLACE R-22 IN AIR CONDITIONING APPLICATIONS
S. K. Fischer and J. R. Sand 1993 17 p Presented at the 1993 American Society of Heating, Refrigerating and Air-Conditioning Engineers Summer Meeting, Denver, CO, 26-30 Jun. 1993
(Contract DE-AC05-84OR-21400)
(DE93-015920; CONF-930675-5) Avail: CASI HC A03/MF A01

The potential health and environmental effects of the depletion of stratospheric ozone from refrigerants containing chlorine have resulted in international treaties, laws, and non-binding agreements to phase-out and eliminate many common refrigerants. R-22 is one of these compounds. A study was conducted to evaluate the potential of twenty-two chlorine-free compounds in refrigerant mixtures of up to three components as substitutes for R-22. The selection or screening of blends was based on vapor compression cycle COP at the 95 F (35 C) cooling condition, the volumetric cooling capacity of the blend, evaporator and condenser temperature glides, and the 'estimated' flammability of the blend. Promising results were obtained for nine ternary blends containing E-125 and eleven ternary blends that exclude E-125. Recommendations are made to obtain further experimental data on E-125 since the mixtures with the best performance contain that compound. Results from this study will be used in an in-depth follow-on analysis. DOE

SUMMARY OF WORK ON COATINGS AND CLADDINGS FOR FOSSIL ENERGY APPLICATIONS

R. W. Swindeman May 1993 25 p
(Contract DE-AC05-84OR-21400)
(DE93-017005; ORNL/TM-12367) Avail: CASI HC A03/MF A01

A summary of efforts to examine coatings and cladding materials for high-strength austenitic steels is provided. Chromized coatings on 17-14CuMo stainless steel and a modified type 316 (HT-UPS) stainless steel were investigated. Claddings included alloy 671, 690, and an iron-aluminide intermetallic alloy. Structural alloys that were clad included type 304 stainless steel, modified type 316 stainless steel, and modified alloy 800H. The capability of producing co-extruded tubing of the experimental alloys was demonstrated. DOE

PROCESS FOR APPLYING HIGH APPLICATION-TEMPERATURE COATING TO HEAT-SENSITIVE ALUMINUM ALLOYS Patent Application
James R. Quartarone, inventor (to Navy), William M. Cicchelli, inventor (to Navy), Kenneth E. Barthelemy, inventor (to Navy), and George V. Morris, inventor (to Navy) 29 Mar. 1993 21 p
(AD-D015823; US-Patent-Appl-SN-038369) Avail: CASI HC A02/MF A01

A process is provided for coating a given surface of a heat sensitive metal article (e.g., thermally massive aluminum) with a high cure temperature coating forming powder. A first oven heating step elevates the metal article's temperature to a predetermined preheat cycle high limit of heat load temperature. After a first predetermined period of time, the metal alloy article is withdrawn from the oven. A high cure temperature coating forming powder is then sprayed onto the given surface of the metal article. The spraying, comprising first and second spray sequences, is initiated essentially immediately after withdrawal of the metal article from the oven. Author (DTIC)

EXCIMER LASER INDUCED PERMANENT ELECTRICAL CONDUCTIVITY AND NANOSTRUCTURES IN POLYMERS
H. M. Phillips, T. Feurer, S. P. LeBlanc, D. L. Callahan (Rice Univ., Houston, TX.), R. Sauerbrey, and J. Bentley 1993 13 p Presented at the OE/LASE 1993 International Society for Optical Engineering Conference, Los Angeles, CA, 16-23 Jan. 1993 Prepared in cooperation with Oak Ridge Inst. for Science and Education, TN
(Contracts DE-AC05-84OR-21400; DE-AC05-76OR-00033)
(DE93-015965; CONF-930159-39) Avail: CASI HC A03/MF A01

The electrical conductivity of high temperature polymers (i.e. polyimide) has been changed permanently from 10(sup (minus)17) (Omega)(sup (minus)1) cm(sup (minus)1) to 10 (Omega)(sup (minus)1) cm(sup (minus)1) by KrF (248 nm) excimer laser irradiation. The conduction mechanism is found to be phonon assisted variable range hopping between small ((approximately)10 nm) carbon rich clusters that form a macroscopic percolation cluster. Using a holographic technique, periodic line structures with periods ranging from 166 nm to 950 nm have been produced in polyimide by direct ablation with a KrF excimer laser. Taking advantage of the large nonlinearity in the laser ablation process, linewidths ranging from 30 nm to several hundred nm could be obtained. This technique was combined with the ability to induce electrical conductivity in polyimide to produce an array of 500 nm wide electrically conducting wires. The conductivity of these wires was similar to that found in macroscopic regions of laser induced conductivity. DOE

POLYMERIZABLE LIPIDS IN THE DEVELOPMENT OF CONTROLLED RELEASE CARRIERS Patent Application
Alok Singh, inventor (to Navy) and Joel M. Schnur, inventor (to Navy) 23 Feb. 1993 24 p
(AD-D015789; US-Patent-Appl-SN-023834) Avail: CASI HC A03/MF A01

The present invention provides novel polymerizable lipids and mixtures thereof with non-polymerizable lipids and methods for the controlled release of encapsulated materials using stabilized or polymerized vesicles. Release is induced by pH, ions, temperature, light or other changes in the environment. Time release mechanisms are also employed. Applications of the present invention especially include encapsulation of enzymes and their subsequent sustained release for degradation of environmental pollutants, encapsulation of fluorescent markers for use in sensor systems, and encapsulation and release of fragrant molecules in detergents. EFFECT OF TEMPERATURE AND O-RING GLAND FINISH ON SEALING ABILITY OF VITON V747-75
Cynthia L. Lach Nov. 1993 15 p
(RTOP 505-63-50-02)
(NASA-TP-3391; L-17214; NAS 1.60:3391) Avail: CASI HC A03/MF A01

As a part of the redesign project of the Space Shuttle solid rocket motor (SRM) following the Challenger accident, the field joint was redesigned to minimize the relative joint motion caused by internal motor pressurization during ignition. The O-ring seals and glands for the field joint were designed both to accommodate structural deflections and to promote pressure-assisted sealing. Tests were conducted in various face seal fixtures to evaluate the ability of Viton V747-75 O-rings to seal for a range of temperatures and surface finishes of the redesigned O-ring gland. The effect of surface finish on the sealing performance and wear characteristics of the O-rings was evaluated during simulated launch conditions that included low-frequency vibrations, gap openings, and rapid pressurizations. The effect of contamination on the sealing performance was also investigated. The O-rings sealed throughout the 75 deg F leak check test and for the seal tests from 50 deg F to 120 deg F for the range of surface finishes investigated. Although abrasions were found in the O-rings from pressurization against the rougher finishes, these abrasions were not detrimental to sealing. Below 50 deg F, Viton V747-75 O-rings were insufficiently resilient to track the test gap opening. Author (revised)

MOLECULAR COMPOSITES FROM LIQUID CRYSTALLINE POLYMERS AND LIQUID CRYSTALLINE THERMOSETS
B. C. Benicewicz, E. P. Douglas, and R. P. Hjelm, Jr. 1993 9 p Presented at the International Workshop on Liquid Crystalline Polymers, Capri, Italy, 1-4 Jun. 1993
(Contracts W-7405-eng-36; W-31-109-eng-38)
(DE93-016608; LA-UR-93-2169; CONF-9306187-1) Avail: CASI HC A02/MF A01

We propose a new approach to molecular composites. This approach uses a mixture of a liquid crystalline polymer and a liquid crystalline thermoset to enhance the miscibility. Preliminary neutron scattering data is presented on a system of short and long rod aromatic amides. The data is interpreted using the interpenetrating phase model of Debye and Bueche. The analysis indicates that the scattering is consistent with this model and shows a characteristic length scale in the range of 70 to 80 A. The intensity of the scattering is lower than calculated for the strong segregation limit, suggesting that there is some intermixing of the components. DOE

ELASTIC PROPERTIES OF A POLYIMIDE FILM DETERMINED BY BRILLOUIN SCATTERING AND MECHANICAL TECHNIQUES
R. S. Kumar (Amoco Oil Co., Naperville, IL.), I. K. Schuller (California Univ., San Diego, La Jolla.), S. S. Kumar, A. Fartash, and M. Grimsditch Jun. 1993 8 p Presented at the Spring Meeting of the Materials Research Society, San Francisco, CA, 12-16 Apr. 1993
(Contract W-31-109-eng-38)
(DE93-017404; ANL/MSD/CP-80248; CONF-930405-31) Avail: CASI HC A02/MF A01

We discuss here the complete determination of the elastic properties of a polyimide film using two experimental techniques. One technique employs the polymer film as a vibrating membrane and allows a direct determination of the 'macroscopic' biaxial modulus. Brillouin scattering, which measures the elastic properties on an (approximately) 100(mu) scale, allows for a complete characterization of the elastic behavior. Results obtained by the two techniques are in agreement within reported error bars. DOE

TN Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-AC05-84OR-21400)
(DE93-016366; ORNL/Sub-84-00216/2) Avail: CASI HC A04

Advanced materials and coatings for low heat rejection engines have been investigated for almost a decade. Much of the work has concentrated on the critical wear interface between the piston ring and cylinder liner. Simplified bench tests have identified families of coatings with high temperature wear performance that could meet or exceed that of conventional engine materials at today's operating temperatures. More recently, engine manufacturers have begun to optimize material combinations and manufacturing processes so that the materials not only have promising friction and wear performance but are practical replacements for current materials from a materials and manufacturing cost standpoint. In this study, the advanced materials supplied by major diesel engine manufacturers were evaluated in an experimental apparatus that simulates many of the in-cylinder conditions of a low heat rejection diesel engine. Results include ring wear factors and average dynamic friction coefficients measured at intervals during the test. These results are compared with other advanced materials tested in the past as well as the baseline wear of current engines. Both fabricated specimens and sections of actual ring and cylinder liners were used in the testing. Observations and relative friction and wear performance of the individual materials are provided. DOE

REMOTE CURE MONITORING OF POLYMERIC RESINS BY LASER RAMAN SPECTROSCOPY
K. C. Hong, T. M. Vess, R. E. Lyon (Federal Aviation Administration, Atlantic City, NJ.), and M. L. Myrick (South Carolina Univ., Columbia.) May 1993 11 p Presented at the 38th International Society for the Advancement of Material and Process Engineering (SAMPE) Symposium and Exhibition, Anaheim, CA, 10-13 May 1993
(Contract W-7405-eng-48)
(DE93-016445; UCRL-JC-112824; CONF-9305232-1) Avail: CASI HC A03/MF A01

The validity of using Raman spectroscopy to monitor the cure chemistries of amine-cured epoxy is demonstrated by correlating NIR absorbance measurements with Raman measurements for a concentration series of bisphenol-A diglycidylether in its own reaction product with diethylamine. The intensity of a normalized Raman peak at 1240 cm(exp -1), assigned to the epoxide functionality, was found to be linearly related to the concentration of epoxide groups in the resin mixtures. Also, it is shown that the Ciba-Geigy Matrimid 5292 system can be monitored by ex-situ FT-Raman spectroscopy by observing changes in the carbonyl stretching (1773 cm(exp -1)) or the C=C stretching of maleimide (1587 cm(exp -1)) during the cure reaction. DOE

CERAMIC FILMS AND INTERFACES: CHEMICAL AND MECHANICAL PROPERTIES
R. Raj Jun. 1993 6 p
(Contract DE-FG02-87ER-45303)
(DE93-018416; DOE/ER-45303/3) Avail: CASI HC A02/MF A01

Results are reported in two areas: (1) understanding the mechanism of superplasticity in those that show unusual resistance to intergranular cavitation, and (2) understanding the growth of heteroepitaxial films of oxides by chemical vapor deposition (CVD) (NiO, TiO_2). DOE

N94-18166# Argonne National Lab., IL.
DEVELOPMENT AND APPLICATION OF LOCAL 3-D X RAY CT RECONSTRUCTION SOFTWARE FOR IMAGING CRITICAL REGIONS IN LARGE CERAMIC TURBINE ROTORS
E. A. Sivers, D. L. Holloway, W. A. Ellingson, and J. Ling (Academia Sinica, Shanghai, China.) 1992 9 p Presented at the Review of Progress in Quantitative Nondestructive Evaluation (NDE), La Jolla, CA, 19-24 Jul. 1992
(Contract W-31-109-eng-38)
(DE93-015159; ANL/MCT/CP-76064; CONF-920799-8) Avail: CASI HC A02/MF A01

Current 3-D X ray CT imaging technology is limited in some cases by the size and sensitivity of the x ray detector. This limitation can be overcome to some degree by the use of region-of-interest (ROI) reconstruction software when only part of a larger object need be examined. However, images produced from ROI data often exhibit severe density shading if they are reconstructed by unaltered 3-D X ray CT algorithms (called Global methods). These density artifacts can be so severe that low-contrast features are hidden. Time-consuming methods introduced previously to remedy these artifacts require specialized processing to replace or approximate the missing data outside the desired volume. Although these methods are required for true densitometry measurements, in many nondestructive tests (NDT) applications only the detection of internal features or relative density variations is required. In such cases, the use of Local (or Lamda) X ray CT, which produces an 'edge-enhanced' reconstruction and requires only minor modifications of the standard 3-D X ray CT algorithm, is recommended. Since the primary difference between Global and Local CT concerns the design of the convolution filter, two versions of a Local CT filter are discussed. These two filters are used in a Local CT implementation to reconstruct 3D X ray CT data. For comparison, Global CT using the Shepp-Logan variation of the fan-beam convolution filter is used to reconstruct the same data. This comparison shows the relative merits of Local and Global CT for fairly noisy scans of large, green Si_3N_4 pressure-slip-cast parts. The Feldkamp modification of fan-beam CT reconstruction is used in the reconstructions. In each case, real-number, reconstructed images are scaled linearly to optimize the available grey-scale levels in the images presented. DOE

METAL/CERAMIC INTERFACES: RELATIONSHIPS BETWEEN STRUCTURE AND CHEMISTRY Final Report, 15 Mar. 1989 - 15 Mar. 1992
M. Ruhle 31 Dec. 1992 83 p
(Contract N00014-89-J-1764)
(AD-A268792) Avail: CASI HC A05/MF A01

Studies have been conducted on interfaces between Al_2O_3 and three different metals: Nb, Pd, and Ni. The objectives have been to establish orientation relationships and to understand the atomistic structure along the interface. In the case of Ni, the formation of a spinel reaction product has also been explored. For Nb/Al_2O_3, it has been found that the orientation relationships and the atomic arrangements depend on the temperature at which the interface was formed. Those formed at high temperature by diffusion bonding have (110) planes in the Nb parallel to the interface. There are also misfit dislocations which 'stand-off' the interface. Conversely, interfaces formed at lower temperatures by molecular beam epitaxy have (111) planes in the Nb parallel to the interface. Moreover, the misfit dislocations are located at the interface itself. The differences are attributed to diffusional effects, such as dislocation climb, that can occur at the higher temperatures. DTIC

STUDY ON RADIATION-INDUCED DETERIORATION OF GREASE AT HIGH TEMPERATURE, 3
Kazuo Arakawa (Japan Atomic Energy Research Inst., Takasaki.), Tuneo Sasuga (Japan Atomic Energy Research Inst., Takasaki.), Tadao Seguchi (Japan Atomic Energy Research Inst., Takasaki.), Takao Soda, Hiroshi Nakanishi, Tamio Akada, Tetsuya Yagi, and Miyuki Hagiwara Nov. 1992 38 p In JAPANESE
(DE93-788368; JAERI-M-92-176) Avail: CASI HC A03/MF A01

Radiation-thermal resistant greases were developed, using pentaphenyl ether (5P4E) and mono-alkyltetraphenyl ether (R-4P) for base oil and bentonite (B) for thickeners. The radiation-thermal resistance of the greases were evaluated by measuring changes in penetration, oil separation, weight loss (amount of volatilized and/or evaporated base oil), and molecular weight of base oil after irradiation with (gamma)-rays at high temperatures (125, 150, 175 and 200 C). The greases showed excellent stability against both radiation and high temperature, and was found usable under the condition up to 4 MGy at 150 C. DOE

STUDIES OF INTERACTIONS BETWEEN CONDUCTING POLYMER AND ORGANIC VAPORS: APPLICATIONS TO CHEMICAL SENSING
M. Josowicz, P. Topart, and R. Cabala May 1993 3 p Presented at the 183rd Electrochemical Society Meeting, Honolulu, HI, 16-21 May 1993
(Contract DE-AC06-76RL-01830)

(DE93-015694; PNL-SA-21801; CONF-930571-19) Avail: CASI HC A01/MF A01

In order to understand the physicochemical mechanism involved in the organic semiconductor charge-transfer processes occurring upon doping of the films with vapor molecules different experimental approaches must be taken. The effect of vapor diffusion into the electrochemically deposited poly(pyrrole), PP and poly(N-vinylcarbazole), PNVCz, films was investigated by monitoring the mass change of the exposed polymer, absorbance changes in the absorption spectra, and the work function change due to the modulation of the Fermi level in the material. An important step in that investigation was to establish the link between the distribution of the active dopant within the surface and the bulk of the material. DOE

ANOMALOUS DIELECTRIC PROPERTIES OF CARBON-BLACK FILLED ELASTOMERS Final Report

Jay Burns 15 Jul. 1993 50 p
(Contract N62190-91-M-0526)
(AD-A269378; NRL-MR-7304) Avail: CASI HC A03/MF A01

Dielectric measurements covering nearly ten decades in frequency are given for a series of neoprene elastomers containing various amounts of conductive carbon black filler. The influence of the conductive filler upon the dielectric properties of the elastomers is treated by an extension of the Maxwell-Wagner-Sillars effect to account for slow tunneling and hopping modes of conduction within the elastomer. Effects upon dielectric response due to clustering and agglomeration of carbon particles are discussed together with some of the problems associated with application of dielectric measurements to obtain information about the internal structure of inhomogeneous materials. DTIC

STUDIES ON GEL ELECTROLYTE BASED ON NITRILE-BUTADIENE COPOLYMERS Final Report, 1 Nov. 1991 - 30 Nov. 1992

A. K. Sircar, B. Kumar, S. M. Linden, and P. T. Weissman Jun. 1993 81 p
(Contract F33615-90-C-2036)
(AD-A269450; WL-TR-93-2083) Avail: CASI HC A05/MF A01

This study is concerned with the preparation of a hybrid electrolyte, suitable for solid-polymer batteries. Based on the study of ionic conductivity in the presence of LiBF4 of a number of nitrile-butadiene copolymers (NBR), hydrogenated NBR (HNBR) was selected as the host polymer. DC conductivity studies with three different lithium salts in different plasticizers showed the highest conductivity for LiBF4. Conductivity of LiBF4 in different plasticizers decreases in the order DMF greater than DMAC greater than Gamma butyrolactone greater than NMP greater than PC=gamma-valerolactone greater than glymes. NMP was chosen as the plasticizer for hybrid films based on its moderate conductivity, low vapor pressure, and low freezing point. DTIC

MORPHOLOGY OF POLYMERIZED MEMBRANES ON AN AMORPHOUS SUBSTRATE AT MOLECULAR RESOLUTION BY AFM Technical Report, 1 Jan. - 31 Dec. 1993

M. Radmacher, B. M. Goettgens, R. W. Tillmann, H. G. Hansma, and P. K. Hansma 15 Sep. 1993 13 p
(Contract N00014-92-J-1260)
(AD-A268760; TR-4-ONR) Avail: CASI HC A03/MF A01

The morphology of lipid membranes on solid supports was studied by micro-fluorescence film-balance technique and atomic force microscopy. The potential of AFM to visualize defects in lipid bilayers was demonstrated. The structure of polymerized membranes of the two lipids 10, 12-penta cosadiynoic acid (PC) and dimethyl bis(penta cosadiynoyl oxyethyl) ammonium bromide (BRONCO) was investigated with AFM. In both cases molecular resolution was achieved using amorphous silicon oxide as substrate. PC showed a highly regular packing of the hydrocarbon chains whereas in the case of the BRONCO film, which was polymerized in the high temperature phase, the positional correlation was only local. AGEING IN PROCESSED POLYMERS: PROGRAMME, SUMMARY, AND ABSTRACTS DISCUSSION MEETING Final Report

1993 28 p Meeting held in Birmingham, England, 5-7 May 1993
Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A268931) Avail: CASI HC A03

The manufacture of almost any plastic article involves some form of quenching as occurs, for example, in extrusion or injection molding. The primary intention is to extract the product from, say, a mold as quickly as possible in order to maximize productivity. This, unfortunately, cannot be equated with the structural stability of the workpiece and so the properties of the formed component may subsequently change (i.e. age) as it slowly relaxes to a more stable state. Such a process is purely physical in origin and may be reversed on heating: it must be distinguished from the more familiar chemical effects which are generally irreversible and are associated with decreases in molar mass. 'Physical aging' was not a serious problem when polymers were used only for low grade applications (although even here it contributed to the 'cheap and nasty' image that is still widespread for plastics - a simple example is the warping of an article that was well formed initially). Now that plastic componeents are increasingly designed for use in demanding situations it becomes essential for the manufacturer to have the ability to forecast long-term changes (particulary in the dimensional, mechanical and thermal properties of the processed component). This, in turn, implies the existence of simple and rapid tests that are able to define the condition of an aged component at some time after its fabrication. DTIC

SOLDERABILITY PERSERVATIVE COATINGS: ELECTROLESS TIN VERSUS ORGANIC AZOLES

I. Artaki (Bell Telephone Labs., Inc., Princeton, NJ.), U. Ray (Bell Telephone Labs., Inc., Princeton, NJ.), A. M. Jackson (Bell Telephone Labs., Inc., Princeton, NJ.), H. M. Gordon (Bell Telephone Labs., Inc., Princeton, NJ.), and P. T. Vianco 1993 14 p Presented at the Surface Mount Technical Association International Conference, San Jose, CA, 31 Aug. - 2 Sep. 1993
(Contract DE-AC04-76DP-00789)
(DE93-017634; SAND-93-1414C; CONF-9308126-2) Avail: CASI HC A03/MF A01

This paper compares the solderability performance and corrosions ion protection effectiveness of electroless tin coatings versus organic azole films after exposure to a series of humidity and thermal (lead-free solders) cycling conditions. The solderability of immersion tin is directly related to the tin oxide growth on the surface and is not affected by the formation of Sn-Cu intermetallic phases as long as the intermetallic phase is protected by a Sn layer. For a nominal tin thickness of 60 micro-inches, the typical thermal excursions associated with assembly are not sufficient to cause the intermetallic phase to consume the entire tin layer. Exposure to humidity at moderate to elevated temperatures promotes heavy tin oxide formation which leads to solderability loss. In contrast, thin azole films are more robust to humidity exposure; however, upon heating in the presence of oxygen, they decompose and lead to severe solderability degradation. Evaluations of lead-free solder pastes for surface mount assembly applications indicate that immersion tin significantly improves the spreading of Sn:Ag and Sn:Bi alloys as compared to azole surface finishes. RELAXATION OF POLAR ORIENTATIONAL ORDER IN NONLINEAR OPTICAL POLYMERS BY SECOND HARMONIC GENERATION

C. H. Wang, H. W. Guan, and S. H. Gu 24 Aug. 1993 22 p Sponsored by ONR Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A269059) Avail: CASI HC A03

An investigation of the decay of the second harmonic generation (SHG) signals from a main chain accordion and a guest/host nonlinear optical (NLO) polymer has been carried out. The shape of the decay of the SHG signal from the main chain polymer is stretched exponential with the width parameter, beta, increasing with increasing temperature. The increase in beta indicates a narrowing of the distribution of relaxation times. On the other hand, the SHG decay signal from the guest/host system is found to be better described by the sum of two single exponential functions with the first short time component affected strongly by the surface change effect and the second slow component associated with the relaxation of the macroscopic polarization. The time constant of the slow component is found to be successively increasing with the poling-decay cycle and it reaches a steady state value after several cycles. The relaxation time lengthening effect is obtained both above and below T(sub g); however, the effect rapidly diminishes as the temperature is increased above T(sub g). The temperature dependence of the steady state relaxation time is not Arrhenius; the Vogel-Fulcher-Tamann equation gives a satisfactory fit to the temperature dependence data. DTIC

PHOTO-INDUCED AND ELECTROOPTIC PROPERTIES OF (Pb,La)(Zr,Ti)O3 FILMS
D. Dimos, W. L. Warren, and B. A. Tuttle 1993 12 p Presented at the Spring Meeting of the Materials Research Society, San Francisco, CA, 12-16 Apr. 1993
(Contract DE-AC04-76DP-00789)
(DE93-017496; SAND-93-0541C; CONF-930405-33) Avail: CASI HC A03/MF A01

Photo-induced changes in the hysteresis behavior of sol-gel derived Pb(Zr,Ti)O3 (PZT) and (Pb,La)(Zr,Ti)O3 (PLZT) films have been characterized. Film photosensitivity has been evaluated with respect to magnitude of effects, time response and spectral dependence. Photo-induced hysteresis changes exhibit a stretched-exponential time dependence, which implies a dispersive mechanism. The spectral dependence is strongly peaked at the band edge (approximately 3.4 eV), which indicates that generation of electron-hole pairs in the material is critical. The photo-induced hysteresis changes are reproducible and stable, which indicates that the controlling charge traps are stable. However, improvements in film photosensitivity will be required to develop these materials for optical memory applications. DOE

AN ULTRAVIOLET FARADAY ROTATOR GLASS Patent Application
James L. Dexter, inventor (to Navy), David G. Cooper, inventor (to Navy), and Douglas H. Blackburn, inventor (to Navy) 29 Apr. 1993 26 p
(AD-D015879; US-Patent-Appl-SN-053287) Avail: CASI HC A03/MF A01

A Faraday rotator glass composition based on a fluoride glass, phosphate glass, fluorophosphate glass or a mixture there of is doped with a lanthanide in concentration sufficient to provide a Verdet constant above at least 2870 deg/Tesla-meter (1 MIN/CM-Oe) x (1.667 x 10 (exp 4) = 1 deg/Tesla-meter and optical transmission above at least 50 percent in a 25mm thick polished glass sample at least at one wavelength in the 200 to 400 nm wavelength region. The faraday rotator glass also includes monovolent non-lanthanide cations such as Na, Li, K or mixtures there of in a concentration sufficient to provide a Verdet constant above at least 2870 deg/Telsa-meter and optical transmission above at least 50 percent in a 25mm thick polished glass sample at least at one wave-length in the 200 to 400 nm wave-length region. The Faraday rotator glass further includes a concentration of divalent or trivalent non-lanthanide cations such as Mg, Be, Ca, Al or mixtures thereof sufficient to provide surface flatness of at least 1/10 of the operating wavelength at 632.8 nm. PRESSURELESS DENSIFICATION OF CERAMIC MATRIX COMPOSITES Final Report, Mar. 1990 - May 1993
M. N. Rahaman, L. R. Dharani, and R. E. Moore 31 Jul. 1993 265 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0267-90)
(AD-A269137) Avail: CASI HC A12

The project produced a remarkable improvement in our understanding of how ceramic matrix composites densify and how they may be persuaded to reach high density by pressureless sintering. The key factors which hinder the sintering of ceramic matrix composites were determined and an innovative processing method for alleviating the sintering difficulties was developed. The method involves coating the reinforcement phase with a cladding of the matrix by chemical precipitation. The research formed the first reported study in which polycrystalline ceramic matrix composites containing an appreciable volume fraction of a reinforcement phase (up to 35 vol% particles or 25 vol% whiskers) were sintered to full density. The room temperature mechanical properties of the composites fabricated by pressureless sintering of coated powders were significantly better than those for similar composites fabricated from mechanically mixed powders. Pressureless sintering of a ceramic matrix with rigid inclusions was analyzed by a viscoelastic finite element method. The effects of inclusion volume fraction, inclusion shape, inclusion interactions, and matrix packing were considered. The model predictions showed good agreement with the experimental data. Considerable potential exists for the application of the experimental and theoretical procedures developed in the project. DTIC

HYDROLYSIS REACTION AND POSITRONIUM DECAY IN SILICA GELS Final Report, 1991 - 1993
T. W. Zerda 23 Aug. 1993 18 p
(Grant AF-AFOSR-0165-90)
(AD-A270028; AFOSR-93-0709TR) Avail: CASI HC A03/MF A01

Positronium decay was used to measure pore size distribution in porous sol-gel glass. It was also used to determine the population of surface strained rings at various stages of firing and drying procedures. Rotational and translational diffusion of molecular liquids, semiconductor clusters, and fullerenes was investigated. Preferential adsorption, surface interactions, and their effects on electronic transitions, vibrational relaxation, rotational, and translational motion were discussed. Computer simulations for molecular motion of SF 6 and cyclohexane inside small pores were run as a function of temperature and pressure. Results were compared with experimental data. Experimental evidence for the pentavalent transitions state for TMOS and TEOS hydrolysis reactions were provided. DTIC

SCALING LAWS FOR DIAMOND CHEMICAL VAPOR DEPOSITION. 2: ATOMIC HYDROGEN TRANSPORT
D. G. Goodwin 15 Sep. 1993 33 p
(AD-A269842) Avail: CASI HC A03/MF A01

Scaling relations are developed to allow estimation of the atomic hydrogen concentration at the substrate during diamond chemical vapor deposition for both diffusion-dominated and convection-dominated reactors. In the convection-dominated case, it is shown that there exists an optimal Mach number which maximizes the H concentration delivered to the substrate. In addition, when homogeneous recombination is taken into account, there exists an optimal operating pressure. This analysis shows that a sonic flow of highly dissociated hydrogen at a pressure near atmospheric is optimal for rapid growth of high-quality diamond. DTIC

DIAMOND BRAZED TO A METAL Patent Application
Thomas P. Thorpe, inventor (to Navy) and Leo A. Snail, inventor (to Navy) 30 Jul. 1993 24 p
(AD-D015877; US-Patent-Appl-SN-099640) Avail: CASI HC A03/MF A01

A unitary article that is solid at a temperature in excess of about 1100 C and which includes a diamond, a metal, and a brazing material brazing the diamond and the metal is described. The brazing material includes a metal carbide adhering to the diamond and a platinum family metal or nickel adhering to the metal. The platinum family metal has dissolved therein carbide forming metal and contains particles of metal carbide. The article is made by depositing a platinum family metal or nickel on a metal melting above the melting point of the platinum family metal or nickel, depositing a carbide forming metal which is soluble in molten platinum family metal or nickel, heating the assembly until platinum family metal or nickel is in a molten state, and cooling the molten platinum family metal or nickel to a solid state. (Contract DLA900-90-D-0304)
(AD-A270139; CIAC-SR-2) Avail: CASI HC A10/MF A03

This report contains bibliographic information on pertinent documents dealing with ceramic matrix composites (CMC's) and reinforcing whiskers,

platelets, and fibers in the period 1970 to 1990. The report is organized into three broad categories. The first category presents bibliographies on the processing methods and properties of various types of reinforcements. The second category constitutes the bulk of the report. This section is divided into seven parts, each being concerned with a particular type of ceramic matrix material, such as borides, carbides, nitrides, oxides, glasses, and glass-ceramics. Within each matrix material, there are further categories sorted by the reinforcement used, e.g., fibers, whiskers, platelets, particulates, etc. The final section of the report contains bibliographies of articles discussing the theories of reinforcement, processing, testing and test methods, as well as certain applications for ceramic matrix composites.

EXPERIMENTAL INVESTIGATION OF WAVE AND FRACTURE PHENOMENA IN IMPACTED CERAMICS: EXPERIMENTS ON SAPPHIRE Final Report
S. Winkler May 1993 80 p
(Contract DAJA45-90-C-0053)
(AD-A270040; IWM-T-8/93; R/D-6472-MS-01) Avail: CASI HC A05/MF A01

Experiments have been performed in order to investigate the behavior of monocrystalline sapphire under impact loading. Tile shaped samples were hit edge-on by spherical or flat steel impactors. The generation of pressure waves and disintegration effect were observed by a Cranz-Schardin high speed camera. The results are compared with earlier ones obtained with glass and alumina as target material. A terminal crack velocity was not found. Crack velocities exceeding the Rayleigh wave speed have been measured. Similar as with glass, nucleations of cracks in the field between the primary wave front and the front of the disintegration area form a damage velocity which can approach the longitudinal wave speed. Usually, cracks did not follow crystal planes; the influence of the crystal structure does not seem to be a strong one.

The development of new methods for the production of complex materials is one of the most important problems in modern solid state chemistry and materials science. This project is attempting to apply the synthetic principles which have evolved in inorganic and organometallic chemistry to the production of technologically important non-oxide ceramics, such as boron nitride, boron carbide, and metal borides. Our recent work has now resulted in the production of new polymer systems, including poly(B-vinylborazine), polyvinylpentaborane, and polyborazylene, that have proven to be high yield precursors to boron-based ceramic materials. Current work is now directed toward the synthesis of new types of molecular and polymeric boron-containing species and an exploration of the solid state properties of the ceramics that have been produced in these studies.

SURVEY OF CERAMIC MACHINING IN JAPAN
B. P. Bandyopadhyay and P. J. Blau Jul. 1993 27 p
(Contract DE-AC05-84OR-21400)
(DE93-018277; ORNL/M-2881) Avail: CASI HC A03/MF A01

This report is a compilation of four subcontract reports provided by B. P. Bandyopadhyay who, while a visiting professor at Toyohashi University in Japan, conducted a survey of ceramic machining technology in that country from January 1 through December 31, 1992. Various aspects of machining technology were surveyed: types of parts being produced, types of ceramic materials being used, the nature of current ceramic machining research and development, and types of machine tools. The four separate reports compiled here were originally provided in a narrative, chronological form, and some of the information has been reorganized into topical areas for this compilation. This report is organized into three sections: The first describes ten ceramic machining research and development organizations and provides a reference list of their current technical publications; the second, two major trade shows; and the third, several other products and commercial developments noted during the course of Bandyopadhyay's stay in Japan. An Appendix lists key individuals who are currently conducting ceramic machining research in Japan.

A CONSTITUTIVE THEORY FOR RIGID POLYURETHANE FOAM
M. K. Neilsen, R. D. Krieg (Tennessee Univ., Knoxville.), and H. L. Schreyer (New Mexico Univ., Albuquerque.) 1992 18 p Presented at the Annual Winter Meeting of the ASME, New Orleans, LA, 28 Nov. - 3 Dec. 1993
(Contract DE-AC04-76DP-00789)
(DE93-011596; SAND-92-2487C; CONF-931121-4) Avail: CASI HC A03/MF A01

Rigid, closed-cell, polyurethane foam consists of interconnected polyurethane plates which form cells. When this foam is compressed, it exhibits an initial elastic regime which is followed by a plateau regime in which the load required to compress the foam remains nearly constant. In the plateau regime, cell walls are damaged and large permanent volume changes are generated. As additional load is applied, cell walls are compressed against neighboring cell walls, and the stiffness of the foam increases and approaches a value equal to that of solid polyurethane. When the foam is loaded in tension, the cell walls are damaged and the foam fractures. A constitutive theory for rigid polyurethane foam has been developed. This theory is based on a decomposition of the foam into two parts: a skeleton and a nonlinear elastic continuum in parallel. The skeleton accounts for the foam behavior in the elastic and plateau regimes and is described using a coupled plasticity with continuum damage theory. The nonlinear elastic continuum accounts for the lock-up of the foam due to internal gas pressure and cell wall interactions. This new constitutive theory has been implemented in both static and dynamic finite element codes. Numerical simulations performed using the new constitutive theory are presented.

ELASTIC PROPERTIES OF AMORPHOUS THIN FILMS STUDIED BY RAYLEIGH WAVES
R. B. Schwarz and J. B. Rubin 1993 13 p Presented at the 8th International Conference on Rapidly Quenched and Metastable Materials, Sendai, Japan, 22-27 Aug. 1993
(Contract W-7405-eng-36)
(DE93-018375; LA-UR-93-2499; CONF-9308140-2) Avail: CASI HC A03/MF A01

Physical vapor deposition in ultra-high vacuum was used to co-deposit nickel and zirconium onto quartz single crystals and grow amorphous Ni(sub 1-x)Zr(sub x) (0.1 less than x less than 0.87) thin films. A high-resolution surface acoustic wave technique was developed for in situ measurement of film shear moduli. The modulus has narrow maxima at x = 0.17, 0.22, 0.43, 0.5, 0.63, and 0.72, reflecting short-range ordering and formation of aggregates in amorphous phase. It is proposed that the aggregates correspond to polytetrahedral atom arrangements limited in size by geometrical frustration. DOE

SHOCK COMPRESSION PROPERTIES OF SILICON CARBIDE
D. E. Grady and M. E. Kipp Jul. 1993 47 p
(Contract DE-AC04-76DP-00789)
(DE93-019927; SAND-92-1832) Avail: CASI HC A03/MF A01

An investigation of the shock compression and release properties of silicon carbide ceramic has been performed. A series of planar impact experiments has been completed in which stationary target discs of ceramic were struck by plates of either similar ceramic or other appropriate material at velocities up to 2.2 km/s with a propellant gun facility. The particle velocity history at the interface between the back of the target ceramic and a lithium-fluoride window material was measured with laser velocity interferometry (VISAR). Impact stresses achieved in these experiments range between about 10 and 50 GPa. Numerical solutions and analytic methods were used to determine the dynamic compression and release stress-strain behavior of the ceramic. Further analysis of the data was performed to determine dynamic strength and compressibility properties of silicon carbide. DOE

REDUCING INADVERTENT ALLOYING OF METAL/CERAMIC BRAZES
J. J. Stephens and P. F. Hlava 1992 27 p Presented at the Minerals and Materials Metals Society Meeting on Low Thermal Expansion Alloys and Composites, Chicago, IL, 1-5 Nov. 1993
(Contract DE-AC04-76DP-00789)
(DE93-009842; SAND-92-0535C; CONF-931154-1) Avail: CASI HC A03/MF A01

Inadvertent alloying of Cu braze metal can compromise metal/ceramic seals. Electron microprobe analyses have quantified alloying of Cu brazes in metal/ceramic feedthroughs. Pin material and processing parameters above 1084C both affect alloying levels. Using either Kovar or Ni-plated 316L stainless steel pins limits alloying compared to Palco pins. Minimizing the time during which the braze is molten also avoids excessive alloying. The original thickness of the Ni plating on the Mo-Mn metallization of the ceramic also influences the alloying content of these brazes. Metal/ceramic brazes made with long brazing cycles, Mo-Mn metallization, and Kovar components grow a layer of intermetallic Mo6(Fe(3.5)CO(3.5))7 on the metallization. Layer thicknesses observed do not appear to compromise joint integrity. Ni additions of approximately 10 and 20 wt.% to Cu apparently increases the stress required to maintain creep rates required for stress relaxation during cooldown. Relative to unalloyed Cu, this strengthening effect tends to increase as temperature is decreased. DOE

The optical properties associated with small particles, which include aerosols, hydrosols and solid microspheres have an impact on several areas of science and engineering. Since the advent of high-speed computers and lasers, the interaction of light with matter in the form of small particles with a discontinuous optical boundary relative to the surroundings has been much better understood. Various nonlinear optical effects have been observed involving interaction of a laser beam with both solid microspheres and liquid microdroplets. These include observation of second and third harmonic generation, four wave mixing, optical visibility, two photon absorption, observation of stimulated emission and lasing, and Stimulated Raman Scattering. Many of these effects are observed with laser intensities which are orders of magnitude less than that required by threshold condition for interactions in macroscopic bulk medium. The primary reason for this is twofold. The front surface of the microsphere acts as a thick lens to enhance the internal intensity of the input laser radiation, and the spherical shape of the droplet acts as an optical cavity to provide feedback at specific wavelengths corresponding to the whispering gallery modes or the morphology dependent resonances (MDR's). The most interesting and significant recent finding in this field is undoubtedly the existence of resonance peaks in linear and nonlinear optical spectra. Such resonance peaks are only dependent on the particle morphology, which means the size, shape and refractive index of the particle. Because of the simultaneous presence of these resonances, they have been referred to by many names, including structural resonances, whispering modes or whispering gallery modes, creeping waves, circumferential waves, surfaces modes, and virtual modes. All of these names refer to the same phenomena, i.e. morphology dependent resonances (MDR's) which has already been described and predicted precisely by electromagnetic theory and Loentz-Mie theory since 1908. MDR's can become important when the particle size (radius a) approaches and exceeds the wavelength of the electromagnetic wave (lambda) and the refractive index of the particle is greater than that of the surrounding medium. Such resonances are easiest to observe from a single particle with high symmetry, such as a sphere, spheroid, or cylinder. MDR's correspond to solutions of the characteristic equations of the electromagnetic fields in the presence of a sphere. Derived from text

PHYSICO CHEMICAL AND MECHANIC APPROACH OF LUBRICATING PROPERTIES OF GRAPHITE + ADDITIVE POWDERS Ph.D. Thesis [APPROCHE PHYSICO-CHIMIQUE ET MECANIQUE DES PROPRIETES LUBRIFIANTES DE POUDRES GRAPHITES + ADDITIFS]
Cecile Langlade 1993 179 p In FRENCH
(ECL-93-02; ETN-93-94896) Avail: CASI HC A09/MF A02

The lubricating property mechanisms of graphite are investigated by macroscopic and microscopic approaches. The physical and tribological properties of graphite are reviewed. Two additives are selected: NA2S2O3 and Na2MoO4. The development of transfer films on metal surfaces is studied. The coefficient of friction is calculated. X-rays diffraction, Raman spectrocopy, electron spectroscopy for chemical analysis, and transmission electron microscopy techniques were used. The results showed that transfer films were developed on a metal surface only in the case of graphite plus additive mixtures. The development of films is observed to occur by successive steps. The growth layer, which develops over the germination layer, has a nanocrystalline structure. ESA

This report is an annotated bibliography of over 750 documents on silicides. Documents published from 1952 to early 1993 are covered. Bibliographic information is organized in alphabetical order by silicide type, i.e. chromium silicides, cobalt silicides, etc. Within each chapter information is reported for specific silicides. A miscellaneous section contains silicides which are neither specifically identified nor warrant a separate section. Chapters are also included for commercially designated silicides and for those silicides which are neither properly identified nor have enough data to warrant a separate chapter. Each section is complete and self contained for efficient use. DTIC

Data presented in this report represent an intense effort to improve processing methods, testing methods, and general mechanical properties (rupture modulus, tensile, creep, stress-rupture, dynamic and cyclic fatigue, and fracture toughness) of candidate ceramics for use in advanced heat engines. This work was performed by many facilities and represents only a small part of the data generated by the Ceramic Technology Project (CTP) since 1986. Materials discussed include GTE PY6, GN-10, NT-154, NT-164, SN-260, SN-251, SN-252, AY6, and silicon nitride combined with rare-earth oxides, Y-TZP, ZTA, NC-433, NT-230, Hexoloy SA, MgO-PSZ-to-MgO-PSZ joints, MgO-PSZ-to-cast iron, and a few whisker/fiber-reinforced ceramics. Information in this report was taken from the project's semiannual and bimonthly progress reports and from final reports summarizing the results of individual studies. Test results are presented in tabular form and in graphs. All data, including test rig descriptions and material characterizations, are stored in the CTP data base and are available to all project participants on request. The objective of this report is to make available the test results from these studies but not to draw conclusions from those data. DOE

PHYSICAL CHEMICAL STUDIES OF CONDUCTING POLYMERS FUNDAMENTAL AND APPLIED Final Report, 15 Aug. 1989 - 14 Apr. 1993
Howard Reiss 20 Aug. 1993 10 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0425-89)
(AD-A270728; AFOSR-93-0768TR) Avail: CASI HC A02

Reversible electroactive doping of conducting polymers was studied with a view toward the determination of important electroactive mechanisms in the polymers. Also, the transport of solutes in polymer films was investigated. Research eventually focused on polyaniline where various modified Donnan phenomena were investigated both by means of theory and experiment. Films formed from proton doped emeraldine base proved to be a remarkably efficient gas selective membrane. The mechanism of this process was studied, also by means of theory and experiment. Proton doped polyaniline may be the most universal membrane for gas separations, and possibly the most important technological fallout of basic research on conducting polymers. Besides a number of publications in scientific journals, a patent has been granted to the use of doped conducting polymer films for separation. DTIC

ELECTRO-OPTIC BEAM STEERING USING NON-LINEAR ORGANIC MATERIALS Final Report, 15 Aug. 1991 - 31 Mar. 1993
R. A. Forber, A. Au, and U. Efron Aug. 1993 19 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F49620-91-C-0068)
(AD-A270809; HAC/REF-J3338; AFOSR-93-0756TR) Avail: CASI HC A03

This report summarizes Hughes Research Laboratories efforts on evaluation of nonlinear optical polymer materials supplied by State University of New York (SUNY), Buffalo, for potential application to the Hughes electro-optic beam deflector device. Evaluations include electro-optic coefficient, response time, transmission, and resistivity. Electro-optic coefficient measurements were made at 633 nm using a simple reflection technique. The samples measured in the range of 1-2.5 pm/V, which is too low to be of practical use in the Hughes beam deflector device. DTIC

BIENZYME SENSORS BASED ON ELECTRICALLY WIRED PEROXIDASE Technical Report No. 7, Oct. 1992 - Oct. 1993
T. J. Ohara, M. S. Vreeke, F. Battaglini, and A. Heller 8 Oct. 1993 4 p
(Contract N00014-91-J-1656)
(AD-A271364) Avail: CASI HC A01/MF A01

Single layer and bilayer bienzyme electrodes based on the combination of a 3-dimensional redox epoxy network that electrically connects redox centers of bound horseradish peroxidase (HRP) to electrodes with a hydrogen peroxide generating enzyme, the redox centers of which are not connected to the redox epoxy network, are described. In the single layer electrodes, H2O2 generated by the first enzyme oxidizes the second enzyme HRP, which oxidizes the redox polymer network, that is electrochemically reduced at 0mV (SCE). When the redox centers of the H2O2 generating enzyme are also electrically connected to the redox epoxy network, the substrate reduced redox centers are oxidized by the redox polymer network, thus lowering the cathodic current. Such attenuation is avoided in bilayer electrodes, where the H2O2 producing enzyme and the redox-epoxy-HRP network are not electrically connected. The single-layer bienzyme electrodes extend the range of amperometric biosensors based on directly redox-epoxy wired enzymes to enzymes that are difficult to electrically connect to redox polymer networks and whose preferred or only co-substrate is oxygen. For a difficult to wire enzyme, choline oxidase, the cathodic current density in the single-layer peroxidase and choline oxidase containing electrode is 80 micro A/sq cm at 10 mM choline concentration, while the anodic current density of the directly wired enzyme is only 5 micro-A/sq cm. Alcohol oxidase is an enzyme that could not be electrically connected to the HRP wiring 3-dimensional redox epoxy network. The anodic current density of its redox epoxy wired electrodes is close to nil, while the cathodic current density, observed in alcohol oxidase and wired peroxidase containing single layer electrodes at 10 mM ethanol is 5 micro-A/sq cm. (Contract DAAL03-92-G-0111)
(AD-A271368; ARO-27314.6-LS) Avail: CASI HC A02/MF A01

In this Final Report, work carried out under ARO grant C-DAAL03-G-0111 is described. The investigations performed include the following: (1) isolation, purification, and characterization of a poly(3-hydroxybutyrate) depolymerase enzyme from Penicillium funiculosum, (2) determination that the depolymerase is a serine esterase, (3) study of the effect of polymer stereochemistry and crystalline order in a semi-crystalline polymer film substrate on enzyme specificity and activity, (3) isolation, purification, and characterization of cellulose acetate degrading microorganisms, and (4) determination of the biodegradability of cellulose acetate with degrees of substitution up to 2.5 under aerobic thermophilic conditions. ADVANCED CIVIL ENGINEERING MATERIALS BASED ON INORGANIC POLYMERS Final Report, 1 Oct. 1989 - 28 Feb. 1993

Paul W. Brown 29 Apr. 1993 166 p
(Grant AF-AFOSR-0405-89)
(AD-A270837; AFOSR-93-0785TR) Avail: CASI HC A08/MF A02

The present program was undertaken to evaluate cement chemistries more suitable for macrodefect-free cement materials. Therefore, the thrust of this work is oriented to the chemistry of advanced cements. Two strategies are being employed. The first is to modify conventional high alumina and portland cements to develop advanced properties. Such properties in this context include improvement in moisture sensitivity and extension of useful service range to temperatures higher than those tolerated by conventional organic polymers. The second strategy is to evaluate novel chemistries. This has included forming alkali zirconium phosphates at low temperature. This class of materials exhibits zero thermal expansion, is stable to high temperature, and therefore may be useful in aerospace applications where dimensional stability is important. DTIC

STRUCTURE AND PROPERTIES OF POLYCARBONATE ALLOYS Ph.D. Thesis [STRUKTUR UND EIGENSCHAFTEN VON POLYCARBONAT-LEGIERUNGEN]
Guenter Dieter Butzbach 1991 112 p In GERMAN Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ETN-93-95071) Avail: CASI HC A06

Influence of adhesion between polymer alloy phase boundaries and of polymer morphology on material structure and properties is investigated. Mixtures of polystyrol and polymethyl methacrylate with polycarbonate were considered as model systems. Differential calorimetry was used for evaluation of glass transition temperature of both mixtures. Raster and transmission electron microscopy experiments show the existence of a two phase structure in both mixtures. Traction and torsion tests were performed in order to obtain modulus of elasticity and mechanical strength values. It is examined how alloy properties can be estimated from pure polymer properties; the Kerner theory was used which allows mechanical and thermal properties of a polymer mixture to be calculated from corresponding values of the homopolymer. Comparisons between experimental and theoretical results show low discrepancies of the relaxation behavior, due to the partial miscibility. Monophased and two phase polymethyl methacrylate and polycarbonate systems are studied as a function of temperature, in order to show that at 170K suppression of beta relaxation and strong ductility drop reduction occur. POLYMER FILMS WITH ENHANCED DIELECTRIC PROPERTIES Final Report, 11 Jun. 1990 - 30 Jun. 1993
John R. Reynolds 26 Jul. 1993 11 p
(Contract DAAL03-90-G-0149)
(AD-A271148; ARO-27808.4-CH) Avail: CASI HC A03/MF A01

A program has been completed utilizing copolymerization and polymer blending methods to prepare polymer films with useful dielectric properties. A scaled-up procedure for the synthesis of a-fluoro acrylonitrile and ethyl-a-fluoroacrylate has been developed. These monomers have been polymerized using free-radical methods and the polymer structures have been fully characterized. Both polymers are atactic. Films of poly(a-fluoro acrylonitrile) exhibit a dielectric constant at 8.9 while films of poly(ethyl-a- fluoroacrylate) have a dielectric constant of 4.0 (50 Hz). Blends of poly(vinylidene fluoride or trifluoroethylene) with poly(methyl methacrylate) have been shown to be miscible over a wide phase composition. At 80% fluorocopolymer the blend exhibits a dielectric constant at 7. DTIC

COOPERATIVE FORMATION OF INORGANIC-ORGANIC INTERFACES IN THE SYNTHESIS OF SILICATE MESOSTRUCTURES
A. Monnier, F. Schuth, Q. Huo, D. Kumar, and D. Margolese 3 Sep. 1993 26 p
(Contract N00014-90-J-1159)
(AD-A271196) Avail: CASI HC A03/MF A01

A model is presented to explain the formation and morphologies of surfactant-silicate mesostructures. Three processes are identified: multidentate binding of silicate oligomers to the cationic surfactant; preferential silicate polymerization in the interface region; and charge density matching between the surfactant and the silicate. The model explains present experimental data, including the transformation between lamellar and hexagonal mesophases, and provides a guide for predicting conditions favoring the formation of lamellar, hexagonal or cubic mesostructures. The model Q230 proposed by Mariani et al. satisfactorily fits the X-ray data collected on the cubic mesostructure material. This model suggests that the silicate polymer forms a unique infinite silicate sheet sitting on the gyroid minimal surface and separating the surfactant molecules into two disconnected volumes. DTIC

DIRECT MONTE CARLO SIMULATION OF THE CHEMICAL EQUILIBRIUM COMPOSITION OF DETONATION PRODUCTS
M. S. Shaw 1993 17 p Presented at the 10th Detonation Symposium, Boston, MA, 12-16 Jul. 1993
(Contract W-7405-eng-36)
(DE93-014559; LA-UR-93-1815; CONF-930713-13) Avail: CASI HC A03/MF A01

A new Monte Carlo simulation method has been developed by the author which gives the equilibrium chemical composition of a molecular fluid directly. The usual NPT ensemble (isothermal-isobaric) is implemented with N being the number of atoms instead of molecules. Changes in chemical composition are treated as correlated spatial moves of atoms. Given the interaction potentials between molecular products, 'exact' EOS points including the equilibrium chemical composition can be determined from the simulations. This method is applied to detonation products at conditions in the region near the Chapman-Jouget state. For the example of NO, it is shown that the CJ detonation velocity can be determined to a few meters per second. A rather small change in cross potentials is shown to shift the chemical equilibrium and the CJ conditions significantly. DOE

DETONATION REACTION STEPS FROZEN BY FREE EXPANSION AND ANALYZED BY MASS SPECTROMETRY
N. R. Greiner, H. A. Fry, N. C. Blais, and R. P. Engelke 1993 6 p Presented at the 10th Detonation Symposium, Boston, MA, 12-16 Jul. 1993
(Contract W-7405-eng-36)
(DE93-012734; LA-UR-93-1545; CONF-930713-7) Avail: CASI HC A02/MF A01

Detonation reactions in small pellets of explosive are frozen by free expansion into a large vacuum chamber and analyzed by time-of-flight mass spectrometry. Sensitive explosives like PETN, RDX, and HMX show rapidly evolving reaction zones and mostly simple products like H_2O, CO, N_2, and CO_2. Less sensitive explosives like TATB, HNS, and TNT show slower evolution of the reaction zone, and more complex products in addition to the simple ones seen in PETN. Isotopic substitution shows that the more complex products contain moderate amounts of NH_3, HCN, NO, HNCO, and NO_2. Other observations include the following: polymerization of aromatic explosive molecules, adducts to the explosive molecules, and explosive molecules with functional groups missing. The more complex products are reservoirs of unreleased energy that may affect performance. DOE

ALUMINUM POWDER/WATER REACTION IGNITED BY ELECTRICAL PULSED POWER Final Report, Oct. 1990 - Apr. 1992
W. M. Lee 12 Aug. 1993 33 p
(AD-A269223; NSWCDD/TR-93/108) Avail: CASI HC A03/MF A01

The effectiveness of the electrical pulsed power technique in driving aluminum-water reactions has been studied. The reactant was prepared by mixing, in the stoichiometric ratio, fine aluminum powder (the fuel) and water (the oxidizer). The electrical energy was delivered to the reactant through an ignition wire embedded in it. The primary objective of the study was to maximize the energy efficiency, which is defined as the ratio of the chemical energy output from the reaction to the electrical energy input. The energy efficiency depends critically on the electrical circuit parameters, physical parameters of the metal fuel powder, and geometrical arrangements of the reactant. Under an optimized set of experimental variables, the energy efficiency exceeds 100. DTIC

This collection contains 173 abstracts from presented papers and poster sessions. The five sessions of the conference were on the subjects of: (1) Thermal, Chemical, and Biological Processing, (2) Applied Biological Research, (3) Bioprocessing Research, (4) Process Economics and Commercialization, and (5) Environmental Biotechnology. Examples of specific topics in the first session include the kinetics of ripening cheese, microbial liquefaction of lignite, and wheat as a feedstock for fuel ethanol. Typical topics in the second session were synergism studies of bacterial and fungal celluloses, conversion of inulin from jerusalem artichokes to sorbitol and ethanol by saccharomyces cerevisiae, and microbial conversion of high rank coals to methane. The third session entertained topics such as hydrodynamic modeling of a liquid fluidized bed bioreactor for coal biosolubilization, aqueous biphasic systems for biological particle partitioning, and arabinose utilization by xylose-fermenting yeast and fungi. The fourth session included such topics as silage processing of forage biomass to alcohol fuels, economics of molasses to ethanol in India, and production of lactic acid from renewable resources. the final session contained papers on such subjects as bioluminescent detection of contaminants in soils, characterization of petroleum contaminated soils in coral atolls in the south Pacific, and landfill management for methane generation and emission control. MODELING SHOCK INITIATION IN COMPOSITION B
M. J. Murphy, E. L. Lee, A. M. Weston (KMI Energy, Livermore, CA.), and A. E. Williams (Naval Research Lab., Washington, DC.) May 1993 8 p Presented at the 10th Detonation Symposium, Boston, MA, 12-16 Jul. 1993
(Contract W-7405-eng-48)
(DE93-016544; UCRL-JC-111975; CONF-930713-19) Avail: CASI HC A02/MF A01

A hydrodynamic modeling study of the shock initiation behavior of the Composition B explosive was performed using the 'Ignition and Growth of Reaction in High Explosive' model developed at the Lawrence Livermore National Laboratory. The HE (heterogeneous explosives) responses were computed using the CALE and DYNA2D hydrocodes and then compared to experimental results. The data from several standard shock initiation and HE performance experiments were used to determine the parameters required for the model. Simulations of the wedge tests (pop plots) and failure diameter tests were found to be sufficient for defining the ignition and growth parameters used in the two term version of the computational model. These coefficients were then applied in the response analysis of several Composition B impact initiation experiments. A description of the methodology used to determine the coefficients and the resulting range of useful application of the ignition and growth of reaction model is described. DOE

SOME PROBLEMS IN THE RHEOLOGICAL CHARACTERISATION OF COMPOSITE ROCKET PROPELLANTS
R. C. Warren Jun. 1993 25 p
(AD-A268806; MRL-TN-642; DODA-AR-008-271) Avail: CASI HC A03/MF A01

Apparent viscosities of a composite propellant analogue were measured with both rotary and extrusion instruments. A Haake Viscometer in the Couette configuration was used with 2 gap widths and also with a profiled cup and rotor. An extrusion rheometer was fitted with a slit die and measurements were made at 2 slit thicknesses. The flow was found to be time dependent, and there was apparent slip at the wall. It is suggested that the cause of this behaviour is filler particle migration in the non-uniform stress fields. The filler migration is assumed to cause a layer of binder to develop at the walls confining the flow, and this layer would lubricate the flow of the bulk of the material causing an apparent slip. The effect of the

slip is to reduce the apparent viscosity of the material, which also appears to be affected by ageing of the samples under ambient conditions for several days. Particle sizes of the solid ingredients were also measured.

ANALYSIS OF DEPOSIT PRECURSORS IN JET FUELS USING FOURIER TRANSFORM INFRARED SPECTROSCOPY Interim Report, Apr. - Aug. 1991
William Schulz and David B. Shehee Jan. 1993 53 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F33615-87-C-2714)
(AD-A269035; WL-TR-93-2015) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Thermal oxidation products from jet fuels will be formed in the presence of fuel and oxygen at elevated temperatures. Development of fuels that will not form solid residues depends on the development of a method to analyze the rate of oxidation of fuels. Gravimetric determination of fuel residues was imprecise and time consuming. Gas Chromatography-Mass Spectrometry (GC-MS) of oxidation products yields a great deal of fundamental information but is too specific to be used as a rapid method for determining the rate of oxidation. Fourier Transform Infrared (FTIR) Spectrometry is non-specific and gives integrated signals for classes of oxidation products that will give rapid analytical results for rates of oxidation as well as the ability to study the effectiveness of chemical additives.

STRAINED RING ENERGETIC BINDERS Final Report, Nov. 1990 - Aug. 1993
L. F. Cannizzo, R. H. Grubbs, M. A. Hillmyer, and J. P. Schaller 27 Aug. 1993 35 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-90-C-0263)
(AD-A269056) Avail: CASI HC A03

The use of thermoplastic elastomers (TPE's) containing strained hydrocarbon rings as energetic propellant binders is an attractive approach to increasing the performance of highly oxidized propellant formulations which currently use HTPB as a binder. The recently reported strained-ring elastomeric polymer polybenzvalene (PBV), produced by ring-opening metathesis polymerization (ROMP), is an example of a strained ring polymer. However, PBV is thermally unstable (T(sub onset) = 77 C, T(sub max)= 137 C) and deflagrates under severe mechanical stretching. In this program several areas were investigated. First, studies to attempt the thermal stabilization of PBV were undertaken. One approach was the partial reduction of the double bonds present in PBV which gave only small increases in thermal stability (Delta T(sub max) = 9 C). The second approach was the addition of radical traps to PBV which, again, gave only small increases in thermal stability (delta T(sub max) = 8 C). The second area investigated a different strained ring polymer, polyhomobenzvalene (PHBV). PHBV was not found to have the mechanical instability problems of PBV, but was still thermally unstable (T(sub onset) = 66 C, T(sub max) = 109 C). The last area studied was the application of acyclic olefins as chain-transfer agents during polymer formation which produced difunctional hydroxytelechelic polymers of cyclooctene and cyclooctadiene (as model systems) with good control of molecular weight.

EVALUATION OF AFTERMARKET LPG CONVERSION KITS IN LIGHT-DUTY VEHICLE APPLICATIONS
E. A. Bass (Southwest Research Inst., San Antonio, TX.) Jun. 1993 155 p
(Contract DE-AC02-83CH-10093)
(DE93-010035; NREL/TP-421-5462) Avail: CASI HC A08/MF A02

SwRI was contracted by NREL to evaluate three LPG conversion kits on a Chevrolet Lumina. The objective of the project was to measure the Federal Test Procedure (FTP) emissions and fuel economy of these kits, and compare their performance to gasoline-fueled operation and to each other. Varying LPG fuel blends allowed a preliminary look at the potential for fuel system disturbance. The project required kit installation and adjustment according to manufacturer's instructions. A limited amount of trouble diagnosis was also performed on the fuel systems. A simultaneous contract from the Texas Railroad Commission, in cooperation with NREL, provided funds for additional testing with market fuels (HD5 propane and industry average gasoline) and hydrocarbon (HC) emissions speciation to determine the ozone-forming potential of LPG HC emissions. This report documents the procurement, installation, and testing of these LPG conversion kits.

MOLECULAR STRUCTURE OF LOW TEMPERATURE FORM OF TRIAMINOGUANIDINIUM NITRATE (TAGN)
A. J. Bracuti Sep. 1993 23 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A270409; ARAED-TR-93012) Avail: CASI HC A03

A rigid-body motion study of triaminoguanidinium nitrate (TAGN) was initiated originally in order to determine if nitrate ion libration might be responsible for the TAGN fast burning rate. A low temperature polymorph of TAGN was discovered by this laboratory during the course of this rigid-body motion study. Continuation of this libration study in the lower temperature regime, however, necessitated understanding the molecular structure of the low temperature form of TAGN. To do this a signal-crystal x-ray diffraction structure determination of the low temperature form was undertaken. The crystal structure was determined including space group, lattice parameters, atomic coordinates and temperature factors, hydrogen bonding, and density.

NEW TEST METHOD TO DETERMINE MODULUS OF ELASTICITY OF ROCKET GRAIN MATERIAL Technical Report
Dick J. Chang, Rolf W. Gross, and Farzad Baban 15 Jan. 1993 20 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F04701-88-C-0089)
(AD-A269758; TR-93(3935)-5) Avail: CASI HC A03

A new testing technique was demonstrated for measuring the modulus of elasticity of low-modulus materials such as rocket propellant grains. The technique described herein offers substantial advantages over the dog bone testing method. The testing procedure is less complicated, and data reduction is simpler. More importantly, a biaxial stress field can be established in the test specimen to simulate conditions encountered during pressurization of a nonlinear and viscoelastic material (e.g., propellant used in solid rocket motors). For metals or linearly elastic materials, dog bone testing may be considered a viable technique through which material properties such as the modulus of elasticity can be extracted accurately. However, for highly filled materials or propellants that exhibit nonlinear and viscoelastic behavior, results obtained through the uniaxial stress data of dog bone tests do not provide material characteristics under biaxial strain conditions. Lack of such material properties will be detrimental to the ability in evaluating and predicting the integrity of the components.

LX-17 CHEMICAL KINETIC MATERIAL MODEL FOR CHEMICAL TOPAZ2D
J. T. Hendricks Feb. 1993 51 p
(Contract W-7405-eng-48)
(DE93-014363; UCRL-ID-113563) Avail: CASI HC A04/MF A01 (US Sales Only)

A chemical reaction kinetic material model for Chemical TOPAZ2D has been developed for modeling burning of LX-17 high explosive. The model was developed to predict warhead thermal response when subjected to fuel and/or propellant fires. Prior to this work, material models have been unavailable for Chemical TOPAZ2D to accurately predict the thermal response of burning LX-17. Numerical results compared to George Bloom's experimental test in 1983 indicate that the burn rate and burn temperature can be simulated with excellent correlation when using, the present LX-17 material model. Numerical modeling, also have insight to the shape of the burn front and the thermal propagation. Observations indicate that a higher burn rate resulted from the experimental test over the adiabatic burn rate of LX-17. This effect was due to the thermal diffusion down the outer stainless steel can wall resulting in LX-17 preignition. The burn rate of LX-17 from George Bloom's experiment was recorded as 3.7-3.9 mm/min. Using the LX-17 material model, a one-dimensional numerical simulation indicates that the adiabatic burn rate is 2.2 mm/min. Since the burning of LX-17 within a weapon is closer to an adiabatic burn, the lower estimate for burn rate shows an enhancement in thermal protection. DOE

DATA COLLECTION PLAN FOR PHASE 2 ALTERNATIVE FUELS BUS DATA COLLECTION PROGRAM
T. Krenelka Jul. 1993 34 p Prepared for Midwest Research Inst., Golden, CO
(Contract DE-AC02-83CH-10093)
(DE93-010047; NREL/TP-421-5264) Avail: CASI HC A03/MF A01

This document constitutes the plan for collecting and reporting data associated with a special set of transit bus demonstrations to be conducted under the Urban Bus Program of the Alternative Motor Fuels Act (AMFA) of 1988. This program, called the Phase 2 Bus Data Collection Program, serves as an adjunct to the Phase 1 Bus Data Collection Program, collecting detailed data on just a few buses to augment and enhance the Phase 1 data in fulfilling the urban bus requirements of AMFA. Demonstrations will be conducted at a few transit system locations throughout the US and will use alternative fuels and associated technologies to reduce undesirable transit bus exhaust emissions. Several organizations will be involved in the data collection; NREL will manage the program, analyze and store vehicle data, and make these data available through the Alternative Fuels Data Center. This information will enable transit agencies, equipment manufacturers, fuel suppliers, and government policy makers to make informed decisions about buying and using alternative fuels. DOE

THE USE OF POST DETONATION ANALYSIS OF STABLE ISOTOPE RATIOS TO DETERMINE THE TYPE AND PRODUCTION PROCESS OF THE EXPLOSIVE INVOLVED
R. R. McGuire, C. A. Velsko, C. G. Lee, and E. Raber Mar. 1993 18 p
(Contract W-7405-eng-48)
(DE93-018497; UCRL-ID-113275) Avail: CASI HC A03/MF A01

The detonation of a series of explosives was performed in a controlled manner to collect the resulting, solid residue or soot. This residue was examined to determine the ratios of the stable carbon, hydrogen, and nitrogen isotopes. The goal of the experiment was to determine if these ratios could be used to indicate, from the post detonation residues, the type and origin of the detonated explosive. The ratios of the stated stable isotopes in the undetonated explosive were also determined. Despite some reservations in the quality of the data resulting from contamination by nonexplosive components, certain trends can be discerned. (1) Carbon isotopes allow aromatic explosives to be distinguished from nonaromatic explosives. This trend seems to carry through the detonation so that the distinction might be made after the fact. (2) The amination process for TATB can be detected through the hydrogen and, to some extent, the nitrogen isotope ratios. Unfortunately, the data are not sufficiently good to determine if this differential carries through the detonation. (3) The relative magnitude and sign of the nitrogen isotope ratio seems to carry through the detonation: some exchange with atmospheric nitrogen is probable. Even though this set of experiments must also be viewed as preliminary, there is a definite indication that certain qualitative characteristics of explosives can be detected after the detonation. This 'signature' could have application to both intelligence and counter terrorism. DOE

ROUND ROBIN EXPERIMENTS ON THE EXPLOSIVE COMPONENTS WATER GAP TEST (ECWGT) Final Report
E. G. deJong Jan. 1993 26 p Sponsored by DMKL, The Hague, Netherlands
(Contract A84/KL/147)
(PML-1992-69; TD92-2413; ETN-93-94934) Copyright Avail: Issuing Activity (TNO Prins Maurits Laboratory, P.O. Box 45, 2280 AA Rijswijk, Netherlands)

Experiments carried out on the explosive components water gap test are reported. This is an accurate test to establish the sensitivity of explosive components and boosters meant for uninterrupted use in explosive trains. The explosive component (acceptor) is glued on the witness rod. The witness rod slides through the locating plug which has an extra hole of 2 mm diameter for water filling purposes. The donor charge is glued in the other end of the tube. To ensure a watertight closure, and to allow a secure fit for the detonator, another locating plug is glued under the donor charge and the tube. The distance between the top of the donor charge and the bottom of the explosive component is filled with demineralized water. The length of the water gap is inversely proportional to the pressure applied on the component. A number 8 detonator is placed just before firing, and the entire test set-up is placed on an assembly holder covered with a cardboard plate with a hole to allow a close fit on the detonator holder. Detailed drawings of the items are given. The results obtained with the leads immersed approximately 2 mm in the water give a higher 'NO GO' level than when the water surface just touches the bottom of the lead. ESA

MATERIALS CHARACTERIZATION OF PROPELLANTS USING ULTRASONICS Final Report
Gary L. Workman and David Jones 31 Oct. 1993 17 p
(Contract NAS8-38609)
(NASA-CR-193877; NAS 1.26:193877) Avail: CASI HC A03/MF A01

Propellant characteristics for solid rocket motors were not completely determined for its use as a processing variable in today's production facilities. A major effort to determine propellant characteristics obtainable through ultrasonic measurement techniques was performed in this task. The information obtained was then used to determine the uniformity of manufacturing methods and/or the ability to determine non-uniformity in processes. Author (revised)

MECHANICAL RESPONSE COMPARISON OF GUN PROPELLANTS EVALUATED UNDER EQUIVALENT TIME-TEMPERATURE CONDITIONS Final Report, Sep. - Nov. 1992
Robert J. Lieb and Michael G. Leadore Sep. 1993 24 p
(DA Proj. 1L1-61102-AH-43)
(AD-A270479; ARL-TR-228) Avail: CASI HC A03/MF A01

Compressive stress relaxation measurements were performed for single- (M14), double- (JA2), and triple-base (M30) propellants, as well as a nitramine composite (M43) gun propellant. This was done to evaluate the response of gun propellants at higher rates than can be easily reached within the laboratory by calculating time-temperature shift factors from these relaxation curves. However, in order to apply these shift parameters to high rate events to predict propellant mechanical response and damage, a link must be established between predicted equivalent response and the actual mechanical and failure behavior observed for these propellants. The mechanical response of these four propellants was characterized at strain rates, which spanned four orders of magnitude, and at the corresponding shifted temperatures. Test results show that the mechanical response for a given propellant type under each of these temperature-rate conditions was the same in the strain domain for which the relaxation shift factors were measured. In addition, the failure response for a given propellant type also proved to be nearly identical at strain levels outside the domain of the stress relaxation tests. These observations permit greater confidence to be placed in the prediction of mechanical and failure response for gun propellants undergoing deformation in strain rate regime the current range of laboratory measurement. MODELING AND NEW EQUIPMENT DEFINITION FOR THE VIBRATION ISOLATION BOX EQUIPMENT SYSTEM Progress Report
Robert L. Sani 1993 11 p
(Grant NAG3-1410)
(NASA-CR-193185; NAS 1.26:193185; CU-153-6505) Avail: CASI HC A03/MF A01

Our MSAD-funded research project is to provide numerical modeling support for the VIBES (Vibration Isolation Box Experiment System) which is an IML2 flight experiment being built by the Japanese research team of Dr. H. Azuma of the Japanese National Aerospace Laboratory. During this reporting period, the following have been accomplished: A semi-consistent mass finite element projection algorithm for 2D and 3D Boussinesq flows has been implemented on Sun, HP And Cray Platforms. The algorithm has better phase speed accuracy than similar finite difference or lumped mass finite element algorithms, an attribute which is essential for addressing realistic g-jitter effects as well as convectively-dominated transient systems. The projection algorithm has been benchmarked against solutions generated via the commercial code FIDAP. The algorithm appears to be accurate as well as computationally efficient. Optimization and potential parallelization studies are underway. Our implementation to date has focused on execution of the basic algorithm with at most a concern for vectorization. The initial time-varying gravity Boussinesq flow simulation is being set up. The mesh is being designed and the input file is being generated. Some preliminary 'small mesh' cases will be attempted on our HP9000/735 while our request to MSAD for supercomputing resources is being addressed. The Japanese research team for VIBES was visited, the current set up and status of the physical experiment was obtained and ongoing E-Mail communication link was established. Derived from text

AXIAL RESPONSE OF DIFFERENTLY EXCITED ANCHORED VISCOUS LIQUID BRIDGES IN ZERO-GRAVITY
Helmut F. Bauer 1990 59 p
(LRT-WE-9-FB-1-1992; ETN-93-95087) Avail: CASI HC A04/MF A01

A cylindrical liquid column with anchored edges at the rim of circular upper and lower discs and consisting of incompressible and viscous liquid, is subjected to different axial excitations, such as one sided or counter directional excitations. The response of the free liquid surface and the velocity and pressure distribution were determined. The response of the free liquid surface was evaluated numerically. ESA

TRANSIENT RESPONSE OF A VISCOUS AND ANCHORED LIQUID BRIDGE TO AN AXIAL PULSE
Helmut F. Bauer 1992 35 p
(LRT-WE-9-FB-7-1992; ETN-93-95092) Avail: CASI HC A03/MF A01

The response of a liquid column to an axial pulse disturbance of the form z(bar)(sub zero) e(exp -alpha x t), exhibiting a sudden rise at the time t = 0 and decaying from there on, was investigated for a viscous anchored-edge liquid column of finite length. The increasing decay magnitude of the pulse shows a strong decay response, that is shorter response times, and increasing free surface displacements. The increase of the surface tension parameter (sigma x a)/(rho x nu(exp 2)) yields to heavily decreasing free surface response. It was found that the response is larger for larger aspect ratios of the liquid bridge. ESA

Malone refrigeration is the use of a liquid near its critical points without evaporations as working fluid in a regenerative or recuperative refrigeration cycle such as the Stirling and Brayton cycles. It's potential advantages include compactness, efficiency, an environmentally benign working fluid, and reasonable cost. One Malone refrigerator has been built and studied; two more are under construction. Malone refrigeration is such a new, relatively unexplored technology that the potential for inventions leading to improvements in efficiency and simplicity is very high. DOE

AEROSOL FILTRATION WITH STEEL FIBER FILTERS
W. Bergman, K. Wilson, G. Larsen, and R. Lopez Apr. 1993 9 p Presented at the American Filtration Society Seminar and Expo Annual Meeting, Chicago, IL, 3-6 May 1993
(Contract W-7405-eng-48)
(DE93-016990; UCRL-JC-113854; CONF-9305166-3) Avail: CASI HC A02/MF A01

An experimental study has been conducted of aerosol penetration through a new high efficiency steel fiber filter and filter media that was developed in cooperation with Pall Corporation. Previous studies have shown that sintered steel fiber media have significant improvements in higher filter efficiency and lower pressure drop than the previous steel filter technology based on sintered powder metal media. In the present study, measurements were made of the penetration of dioctyl sebacate (DOS) aerosols through flat sheet samples, pleated cartridge filters, and a 1000 cfm filter having 64 cartridges housed in a 2 x 2 x 1 ft. frame. The steel fiber media used in our study consists of 2 micron diameter stainless steel (316 L) fibers sintered together into sheets.

REGENERATOR OPTIMIZATION FOR STIRLING CYCLE REFRIGERATION
S. A. Colgate and A. G. Petschek (New Mexico Inst. of Mining and Technology, Socorro.) 1993 47 p Presented at the International Cryogenic Engineering and Material Conference, Albuquerque, NM, 12-16 Jul. 1993
(Contract W-7405-eng-36)
(DE93-018468; LA-UR-93-2656; CONF-930703-15) Avail: CASI HC A03/MF A01

A cryogenic regenerator for a Stirling cycle is designed using fractional loss or entropy gain as the criterion of performance. The gas losses are treated separately from heat storage medium losses. For the optimum channel flow nonturbulent design, the maximization of heat transfer from the gas to the wall and the minimization of entropy production by friction leads to a gas flow velocity criterion of sound speed times loss fraction. This velocity with a given frequency leads to a Stirling cycle dead volume ratio and consequently a channel of specified length and width. The thermal properties of the channel wall must then accommodate this cyclic heat flow without substantially increasing the loss fraction. It is found that stainless steel or plastics are adequate for 30 to 300 K, but that the lower temperature stages of 4 to 30 K require either a special lead alloy of moderate conductivity or a segmented anisotropic construction of alternate highly conducting lead layers and alternate insulating glass or epoxy fiber glass spacers. An overall efficiency of (congruent) 50% of Carnot is predicted at a frequency of 30 Hz and a pressure of one atmosphere.

THE FIRE RESISTANCE OF PROFILED THIN STEEL SHEET STRUCTURES [OHUTLEVYRAKENTEIDEN PALONKESTO: RAKENTEIDEN ANALYSOINTI TIETOKONEELLA. OHJELMAT JA MENETELMAET]
Tapio Leino, Pekka Salmi, and Jukki Myllymaeki Jan. 1992 116 p In FINNISH
(VTT-TIED-1320; ISBN-951-38-4053-0; ETN-93-94469) Copyright Avail: CASI HC A06/MF A02

Research to compare different methods of calculating the fire resistance of thin profiled metal sheet structures and to find out about any possible computer programs developed for this purpose is presented. The fire-technical material properties of thin profiled metal sheets and some special fire-technical features concerning the structures made with the thin profiled metal sheets are presented. The loads and their combinations which should be considered in case of the fire are also explained. Some analysis results are presented to give an idea about the changes of stresses and the support reactions acting at the connections of the thin metal sheet structures in the fire situation. All the analysis results were compared (when possible) with the fire test results. Some analysis tools (computer programs) were developed for calculating the fire resistance of structures. The accuracy of the analysis results depend greatly on the available material property values used in the models. The analysis tools are utilized at the design phase of the structure (or new products) to minimize the number of fire tests needed.

MELT SPINNING STUDY Final Report
Gary L. Workman and Thomas Rathz 19 Apr. 1993 15 p
(Contract NAS8-38609)
(NASA-CR-193823; NAS 1.26:193823) Avail: CASI HC A03/MF A01

Containerless processing of materials provides an excellent opportunity to study nucleation phenomena and produce unique materials, primarily through the formation of metastable phases and deep undercoolings. Deep undercoolings can be readily achieved in falling drops of molten material. Extended solute solubilities and greatly refined microstructures can also be obtained in containerless processing experiments. The Drop Tube Facility at Marshall Space Flight Center has played an important role in enhancing that area of research. Previous experiments performed in the Drop Tube with refractory metals has shown very interesting microstructural changes associated with deep undercoolings. It is apparent also that the microstructure of the deep undercooled species may be changing due to the release of the latent heat of fusion during recalescence. For scientific purposes, it is important to be able to differentiate between the microstructures of the two types of metallic species. A review of the literature shows that although significant advances have been made with respect to the engineering aspects of rapid solidification phenomena, there is still much to be learned in terms of understanding the basic phenomena.

The two major ways in which rapid solidification processing provides improved structures and hence improved properties are: (1) production of refined structures such as fine dendrites and eutectics, and (2) production of new alloy compositions, microstructures, and phases through extended solid solubility, new phase reaction sequences, and the formation of metallic-glass microstructures. The objective of this work has been to determine the optimal methodology required to extract this excess energy without affecting the thermo-physical parameters of the under-cooled melt. In normal containerless processing experiments recalescence occurs as the melt returns toward the melting point in order to solidify. A new type of experiment is sought in which the resultant microstructure of the undercooled species is frozen in without going through the melting point regime and subsequent near equilibrium solidification of the remaining liquid. This experimental approach entails the design of an appropriate melt spinning system which is compatible with Drop Tube operations and processing constraints. That work is the goal of this study. DESIGN VERIFICATION AND ACCEPTANCE TESTS OF THE ASST-A HELIUM REFRIGERATION SYSTEM
V. Ganni and T. V. V. R. Apparao Jul. 1993 12 p Presented at the International Cryogenic Engineering and Material Conference, Albuquerque, NM, 12-16 Jul. 1993
(Contract DE-AC35-89ER-40486)
(DE93-019746; SSCL-Preprint-488; CONF-930703-27) Avail: CASI HC A03/MF A01

Three similar helium refrigerator systems have been installed at the Superconducting Super Collider Laboratory (SSCL) N15 site: the ASST-A system, which will be used for the accelerator system's full cell string test; the N15-B system, which will be used for string testing in the tunnel; and a third plant, dedicated to magnet testing at the Magnet Testing Laboratory. The ASST-A and N15-B systems will ultimately be a part of the collider's N15 sector station equipment. Each of these three systems has many subsystems, but the design basis for the main refrigerator is the same. Each system has a guaranteed capacity of 2000 W of refrigeration and 20 g/s liquefaction at 4.5 K. The testing and design verification of the ASST-A refrigeration system consisted of parametric tests on the compressors and the total system. A summary of the initial performance test data is given in this paper. The tests were conducted for two cases: (1) all four compressors were operating; and (2) only one compressor in each stage was operating. In each case, tests were conducted in three modes of operation described later on. The process design basis supplied by the manufacturers and used in the design of the main components--the compressor and expanders and heat exchangers for the coldbox--were used to reduce the actual test data using process simulation methodology. In addition, the test results and the process design submitted by the manufacturer were analyzed using exergy analysis. This paper presents both the process and the exergy analyses of the manufacturer's design and the actual test data for Case 1. The process analyses are presented in the form of T-S diagrams. The results of the energy analyses comparing the exergy losses of each component and the total system for the manufacturer's design and the test data are presented. DOE

PRECISION MACHINING AND POLISHING OF SCINTILLATING CRYSTALS FOR LARGE CALORIMETERS AND HODOSCOPES
C. R. Wuest and B. A. Fuchs May 1993 6 p Presented at the 5th Annual International Industrial Symposium on the Super Collider and Exhibition, San Francisco, CA, 6-8 May 1993
(Contract W-7405-eng-48)
(DE93-018663; UCRL-JC-114014; CONF-930537-94) Avail: CASI HC A02/MF A01

New machining and polishing techniques have been developed for large barium fluoride scintillating crystals that provide crystalline surfaces without sub-surface damage or deformation as verified by Atomic Force Microscopy (AFM) and Rutherford Back-Scattering (RBS) analyses. Surface roughness of about 10-20 angstroms and sub-micron mechanical tolerances have been demonstrated on large crystal samples. Mass production techniques have also been developed for machining and polishing up to five 50 cm long crystals at one time. We present this technology along with surface studies of barium fluoride crystals polished with this technique. This technology is applicable for a number of new crystal detectors including the Barium Fluoride Electromagnetic Calorimeter at SSC, the Crystal Clear Collaboration's cerium fluoride calorimeter at LHC, and the KTeV and PHENIX scintillating hodoscopes at Fermilab and RHIC, respectively. Lawrence Livermore National Laboratory (LLNL) has an active program of study on barium fluoride scintillating crystals for the Barium Fluoride Electromagnetic Calorimeter Collaboration and cerium fluoride and lead fluoride for the Crystal Clear Collaboration. This program has resulted in a number of significant improvements in the mechanical processing, polishing, and coating of fluoride crystals. Techniques have been developed using diamond-loaded pitch lapping that can produce 15 A RMS surface finishes over large areas. Also, special polishing fixtures have been designed based on mounting technology developed for the 1.1 m diameter optics used in LLNL's Nova Laser. These fixtures allow as many as five 25-50 cm long crystals to be polished and lapped at the same time with tolerances satisfying the stringent requirements of crystal calorimeters. We also discuss results on coating barium fluoride with UV reflective layers of magnesium fluoride and aluminum. DOE

MEASURING METHODS FOR EVALUATION OF DYNAMIC TYRE PROPERTIES Ph.D. Thesis [MESSTECHNISCHE METHODEN ZUR BEWERTUNG DYNAMISCHER REIFENEIGENSCHAFTEN]
Klaus Kmoch 1992 288 p In GERMAN
(ETN-93-95054) Avail: CASI HC A13/MF A03

Extensive measuring methods for macroscopic assessment of tire properties, based on classical mechanics and dynamics, are presented. Theoretical results and measurements were included in an expert system, where the pneumatic tire is represented as a wheel with particular elastic properties. For geometry measurement of the tire surface, a laser scanner test bed was used. The tire was excited with a shaker in order to obtain acceleration signals and for estimating global parameters such as stiffness, damping, and nonlinearity influence, which is found to increase with excitation force. Tire dynamic behavior was examined by low velocities with microscopy and infrared thermography, in order to quantify temperature augmentation and tangential and normal forces in the contact area; the slip stick oscillations were recorded on microphones. A drum test bed was used for studying tire behavior at high velocities and the tire vehicle interaction was established with acceleration measurements; nonuniformity influence on rolling stability was ascertained. The results were compared with data from theoretical models, which are pinpoint mass systems or multiple bodies problems. ESA

ARC DETECTION AND PROTECTION IN HIGH-POWER ANTENNA SYSTEMS
J. B. O. Caughman and D. J. Hoffman 1993 5 p Presented at the 10th Topical Conference on Radio Frequency Power in Plasmas, Boston, MA, 1-3 Apr. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-AC05-84OR-21400)
(DE93-013272; CONF-9304112-6) Avail: CASI HC A01

In an effort to establish a criteria for determining the presence of an arc in an antenna system, the change in the input reflection coefficient caused by an arc of arbitrary impedance and location has been calculated for two representative antenna systems. The antenna systems that have been studied are a resonant double loop antenna system (Tore Supra, TFTR) and a coupled four-strap antenna system (D3-D). The amount of power that is coupled into an arc as a function of the reflection coefficient and arc impedance has been calculated. Results of the calculation have shown that up to fifty percent of the forward power can be coupled to an arc, when the measured reflection coefficient is 0.5 and up to ten percent of the forward power can be coupled to an arc when the reflection coefficient is 0.1, depending on the impedance and location of the arc and the particular antenna system. The calculations have shown that changes in the magnitude of the reflection coefficient caused by an arc are often accompanied by changes in voltage ratios on the same current strap or between different straps and by changes in the phase angles of the voltages and/or the reflection coefficient. Recommendations for the use of voltage magnitude and phase detectors as a diagnostic for arc detection and protection are made. DOE

PVDF MEASUREMENT OF SOFT X RAY INDUCED SHOCK AND FILTER DEBRIS IMPULSE
D. E. Johnson (Ktech Corp., Albuquerque, NM.), L. M. Lee (Ktech Corp., Albuquerque, NM.), M. A. Hedemann, and F. Bauer (Institut Franco-Allemand de Recherches, Saint-Louis, France.) 1993 4 p Presented at the 14th International Conference of the International Association for the Advancement of High Pressure Science and Technology, Colorado Springs, CO, 27 Jun. - 2 Jul. 1993
(Contract DE-AC04-76DP-00789)
(DE93-017633; SAND-93-1539C; CONF-930676-4) Avail: CASI HC A01/MF A01

PVDF piezoelectric polymer shock stress sensors have been used to measure the shock and impulse generated by soft X-rays and by filter debris in the SATURN Plasma Radiation Source at Sandia National Laboratories, NM. SATURN was used to generate 30 to 40 kJ, 20-ns duration, line radiation at 2 to 3 keV. Fluence on samples was nominally 40, 200, and 400 kJ/m(sup 2) (1, 5, and 10 cal/cm(sup 2)). Measurements of X-ray induced material shock response exposing both aluminum and PMMA acrylic samples agree well with companion measurements made with single crystal X-cut quartz gauges. Time-of-flight, stress, and impulse produced by Kimfol (polycarbonate/aluminum) filter debris were also measured with the PVDF gauges. DOE

RADIO WAVE PROPAGATION IN STRUCTURED IONIZATION FOR SATELLITE AND RADAR APPLICATIONS
Leon A. Wittwer 1 Aug. 1993 83 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A268457; DNA-IR-93-35) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

This report is an extension to DNA 5304D and DNA-IR-82-02 which presented the radio propagation algorithms recommended for use by DNA to calculate the properties of scintillated signals. This report covers effects related to antennas and extends the formalism to cover two component power spectra of plasma fluctuations. In addition, an improved representation of the total electron content power spectrum is included to support space radar and similar applications. Appendix E contains SUBROUTINE PROP which implements the radio propagation models. DTIC

FLIGHT DEMONSTRATION OF IMAGE FIX-TAKING WITH SAR
Richard Gibbs (Draper, Charles Stark Lab., Inc., Cambridge, MA.), Matthew Bottkol (Draper, Charles Stark Lab., Inc., Cambridge, MA.), and Todd Owen 11 Jun. 1993 6 p Presented at the 49th Inst. of Navigation Annual Meeting, Cambridge, MA, 21-23 Jun. 1993
(Contract DE-AC04-76DP-00789)
(DE93-016499; SAND-93-0779C; CONF-9306185-1) Avail: CASI HC A02/MF A01

Airborne synthetic aperture radar (SAR) uses coherent radar processing techniques to image ground reflectors. After processing, range and Doppler can be associated with any feature of interest in the final image. The location of any imaged feature can be estimated using a Kalman filter to combine these data with GPS and INS navigation data. This paper reports on the results of a flight demonstration of such a system, using an airborne SAR developed at Sandia. Collected data consisted of multiple SAR images containing surveyed reflectors, GPS/INS output taken aboard the aircraft, and GPS output recorded at surveyed ground stations. These data were post-processed at Sandia and at Draper Laboratory to obtain a navigation solution based on differential GPS and to demonstrate SAR fix-taking performance. This study successfully demonstrates accuracy of about one meter for fixing the position of a point imaged with SAR from an airborne platform. Because differential GPS was used, the navigation error was of about the same magnitude as the SAR range measurement error. Consequently, the measurements served primarily to fix the SAR image rather than to update the navigator. DOE

SUPPRESSION OF BACKSCATTER AND STRAY REFLECTION INDUCED PHASE NOISE IN MICHELSON INTERFEROMETERS Patent Application
Alan D. Kersey, inventor (to Navy), M. J. Marrone, inventor (to Navy), C. A. Villarruel, inventor (to Navy), Clay Kirkendall, inventor (to Navy), and Anthony Dandridge, inventor (to Navy) 30 Apr. 1993 28 p
(AD-D015809; US-Patent-Appl-SN-056019) Avail: CASI HC A03/MF A01

An optical system, including a reflectometric interferometer such as of the Michelson type, and method of reducing phase noise in such systems uses an uni-directional optical isolator in at least one of two optical links, such as optical fibers, to prevent propagation of backscattered radiation or radiation which may be backscattered in respective ones of the two optical links in order to limit the introduction of phase noise when the optical lengths and/or illumination coherence length is made long. The uni-directional isolation is preferably done with polarization independent isolators comprising a Faraday rotator between two prisms. If the uni-directional isolators are placed adjacent the interferometer, the length of optical leads or links to and from the interferometer can be increased up to several kilometers in length without any significant increase in phase noise over the noise levels present in the interferometer alone. VARIABLE TIME-STEP INTEGRATION FOR INTENSE FIELD EFFECTS
C. Cerjan and R. Kosloff (Hebrew Univ., Jerusalem, Israel.) Oct. 1992 7 p Presented at the NATO Advanced Research Workshop on Time Dependent Quantum Molecular Dynamics; Experiments and Theory, Snowbird, UT, 30 Mar. - 3 Apr. 1992
(Contract W-7405-eng-48)
(DE93-013296; UCRL-JC-112157; CONF-9203238-3) Avail: CASI HC A02/MF A01

In many physically interesting problems with explicit time dependence, it is advantageous to directly solve the time-dependent Schroedinger equation. For example, the interaction of a particle with a time-dependent dissipative bath, such as a solid, would find its most natural interpretation with an explicit solution, compared to say a high order perturbative decomposition. Furthermore, the time-dependent formulation more closely resembles most experimental investigations which typically prepare an initial wavepacket with a specified temporal and spatial spread. Given the desirability of using a time-dependent formulation, the question of numerical efficiency will inevitably arise when detailed calculations are attempted. Strictly numerical attempts to solve the Schroedinger equation can be broadly classified as either time-independent or time-dependant methods. The former category typically expands the solution in an appropriate set of convenient basis functions and then solves the associated energy characteristic value problem. The difficult part of these calculations is usually the evaluation of potential matrix elements over the chosen basis set. The second category typically uses a spatial grid and an approximation to the temporal evolution operator to generate a pointwise solution to the Hamiltonian operator. This class of methods does not require potential matrix evaluations, but defers the difficulties to the representation of the Laplacian operator. It is not possible in general to simultaneously have diagonal matrix representations for both the kinetic and potential energy contributions to the Hamiltonian operator. Thus any numerical method must confront a more or less difficult calculational problem for either contribution. DOE

AUTOMATIC TUNING OF AN INTEGRAL FUZZY CONTROLLER

Riccardo Scattolini and Nicola Schiavoni 1993 18 p Sponsored in part by Ministry of University and Scientific Research and Technology, Italy, and CNR

(Rept-93-006; ETN-93-94513) Avail: Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy

An empirical method for the automatic tuning of integral type fuzzy controller, where the regulator 'gain' is made to depend on the actual values of the error and the error variation, both appropriately normalized, is presented. The design technique is based upon the assumption that an approximate first order plus delay plant model, derived from the open loop step response, is available. The input membership functions as well as the values of the members of the output fuzzy set depend on the model characteristics. A number of simulation results are reported to witness the potentialities of the proposed approach. Some implementation considerations and comparisons with standard PI control are given. ESA

NEURAL NETWORKS TO CLASSIFY SPEAKER INDEPENDENT ISOLATED WORDS RECORDED IN RADIO CAR ENVIRONMENTS

C. Alippi (University Coll., London, England.), M. Simeoni, and V. Torri Feb. 1993 21 p

(Rept-93-013; ETN-93-94517) Avail: Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy

Many applications, in particular the ones requiring nonlinear signal processing, have proved Artificial Neural Networks (ANN's) to be invaluable tools for model free estimation. The classifying abilities of ANN's are addressed by testing their performance in a speaker independent word recognition application. A real world case requiring implementation of compact integrated devices is taken into account: the classification of isolated words in radio car environment. A multispeaker database of isolated words was recorded in different environments. Data were first processed to determinate the boundaries of each word and then to extract speech features, the latter accomplished by using cepstral coefficient representation, log area ratios and filters bank techniques. Multilayered perceptron and adaptive vector quantization neural paradigms were tested to find a reasonable compromise between performances and network simplicity, fundamental requirement for the implementation of compact real time running neural devices. SECURING ELECTRONIC MAIL: THE RISKS AND FUTURE OF ELECTRONIC MAIL

S. A. Weeber Mar. 1993 16 p Presented at the 15th Computer Security Group Training Conference: Mission Possible - Connected and Protected, Albuquerque, NM, 3-6 May 1993

(Contract W-7405-eng-48)

(DE93-017187; UCRL-JC-113355; CONF-9305151-8) Avail: CASI HC A03/MF A01

The network explosion of the past decade has significantly affected how many of us conduct our day to day work. We increasingly rely on network services such as electronic mail, file transfer, and network newsgroups to collect and distribute information. Unfortunately, few of the network services in use today were designed with the security issues of large heterogeneous networks in mind. In particular, electronic mail, although heavily relied upon, is notoriously insecure. Messages can be forged, snooped, and even altered by users with only a moderate level of system proficiency. The level of trust that can be assigned at present to these services needs to be carefully considered. In the past few years, standards and tools have begun to appear addressing the security concerns of electronic mail. Principal among these are RFC's 1421, 1422, 1423, and 1424, which propose Internet standards in the areas of message encipherment, key management, and algorithms for privacy enhanced mail (PEM). Additionally, three PEM systems, offering varying levels of compliance with the PEM RFC's, have also recently emerged: PGP, RIPEM, and TIS/PEM. This paper addresses the motivations and requirements for more secure electronic mail, and evaluates the suitability of the currently available PEM systems. DOE

ADVANCES AND APPLICATIONS OF ABCI

Y. H. Chin May 1993 3 p Presented at the International Particle Accelerator Conference, Washington, DC, 17-20 May 1993

(Contract DE-AC03-76SF-00098)

(DE93-016971; LBL-33268; ESG-220; CONF-930511-222) Avail: CASI HC A01/MF A01

ABCI (Azimuthal Beam Cavity Interaction) is a computer program which solves the Maxwell equations directly in the time domain when a Gaussian beam goes through an axi-symmetrical structure on or off axis. Many new features have been implemented in the new version of ABCI (presently version 6.6), including the 'moving mesh' and Napoly's method of calculation of wake potentials. The mesh is now generated only for the part of the structure inside a window and moves together with the window frame. This moving mesh option reduces the number of mesh points considerably, and very fine meshes can be used. Napoly's integration method makes it possible to compute wake potentials in a structure such as a collimator, where parts of the cavity material are at smaller radii than that of the beam pipes, in such a way that the contribution from the beam pipes vanishes. For the monopole wake potential, ABCI can be applied even to structures with unequal beam pipe radii. Furthermore, the radial mesh size can be varied over the structure, permitting use a fine mesh only where actually needed. With these improvements, the program allows computation of wake fields for structures far too complicated for older codes. Plots of a cavity shape and wake potentials can be obtained in the form of a Top Drawer file. The program can also calculate and plot the impedance of a structure and/or the distribution of the deposited energy as a function of the frequency from Fourier transforms of wake potentials. Its usefulness is illustrated by showing some numerical examples. DOE

THE ACCURACY OF MONOSTATIC AND BISTATIC RADAR IMAGING BY RANGE-DOPPLER-PROCESSING WITH AND WITHOUT MOTION COMPENSATION Ph.D. Thesis - Wuppertal Univ. [ZUR FOKUSSIERTEN ZWEIDIMENSIONALEN ABBILDUNG AUS MONOSTATISCHEN UND BISTATISCHEN RANGE-DOPPLER-MESSUNGEN MIT EINEM KOHAERENTEN KURZPULSRADAR MIT FEST EINSTELLBAREN RANGE-GATES IM ZENTIMETER-WELLENBEREICH]

Michael Kleintz Feb. 1993 208 p In GERMAN Original contains color illustrations

(DLR-FB-93-07; ETN-93-94876) Avail: CASI HC A10/MF A03

Two dimensional range Doppler imaging of flat rotating targets is discussed. The theory of imaging was extended to an arbitrary bistatic geometry by means of a linear transform of the far field focused range and doppler shift to the horizontal cartesian coordinates of the turntable. From the properties of the unfocused point spread function the algorithms of focusing in Doppler and were derived. The boundaries of validity of the point scatter model were shown by a simple example of wandering glint points. Simulations (mono and bistatic) as well as measurements (monostatic) in order to confirm theoretical results are shown. ESA

WAVEGUIDE AND RESONATOR PERTURBATION TECHNIQUES FOR MEASURING CHIRALITY AND NON-RECIPROCITY OF BIISOTROPIC MATERIALS

S. A. Tretyakov and A. J. Viitanen Feb. 1993 13 p

(PB93-187243; ISBN-951-22-1411-3) Avail: CASI HC A03/MF A01

Waveguide and resonator measurement techniques for determining electromagnetic parameters of general biisotropic, or non-reciprocal chiral, materials are considered. The biisotropic materials are the most general linear isotropic media. The constitutive relations of these materials are governed by four complex material parameters. The perturbation techniques for measuring the materials through the change in the propagation constant of waveguide modes and the shift in resonance frequency for resonators are considered. To measure these parameters a method using waveguides or cavity resonators with two degenerated modes is proposed. NTIS

TOMOGRAPHIC MATHEMATICAL IDEAS APPLIED TO RADAR DETECTION Final Report, 1 Sep. 1989 - 31 Oct. 1992

F. A. Grunbaum 31 Oct. 1992 4 p

(Contract F49620-89-C-0107)

(AD-A268789; AFOSR-93-0624TR) Avail: CASI HC A01/MF A01

The researchers undertook an examination of many of the mathematical issues that are well understood in the case of the medical application of these tomographic ideas (i.e. x-ray scanners) but have not yet been explored in the arena of radar imaging. Among the issues concentrated on were the following: (1) an understanding of the way in which data might be collected in radar; (2) the proper interpretation of these data as projections of a two dimensional distribution in range-Doppler space; (3) a careful study of the effect that 'ellipsoidal integrals' or even simpler 'strip integrals' will have on an algorithm that is supposed to work with 'line integrals;' and (4) a study of the effect that an increase of 'lateral sampling per one dimensional projection' will have on the final reconstructions. This issue is well understood in the medical application and it serves to determine the number of detectors to be used, but has to be reexamined and reinterpreted in the radar context, a study of the competing methods to obtain range-Doppler images. These include Synthetic Aperture Radar and are based on the relative motion of the object vis-a-vis the radar. DTIC

WIDEBAND ELECTROMAGNETIC SCATTERING/ANALYSIS PROGRAM: FAR ZONE ELECTROMAGNETIC SCATTERING FROM COMPLEX SHAPES USING GEOMETRICAL THEORY OF DIFFRACTION Interim Report, 1 May 1991 - 31 Dec. 1992

N. Akhter and R. J. Marhefka Dec. 1992 193 p

(AF Proj. 7622)

(AD-A268790; Rept-724733-1; WL-TR-93-1030) Avail: CASI HC A09/MF A03

Backscatter and bistatic scattering in the far zone using the uniform theory of diffraction (UTD) from shapes which require second and higher order interactions to get an accurate solution over a wide range of angles is considered. One of the simplest of these shapes is the two-dimensional dihedral. The solution contains interactions of up to third order, which provide excellent results for the dihedrals of 60 deg or greater and for sizes larger than one wavelength in extent. The dihedral solution is modified for curvature and caustic corrections to get results for the top-hat, bruderhedral, and bi-cone. Another extension to the dihedral is the parallel plate cavity and the circular cavity. First and second order caustic corrections for the donut are included. Also, the result of the dihedral is modified to get results for the multi-joined cylinders made of PVC pipes filled with absorber. Analytical results are validated against method of moments or measurements. DTIC

RESPONSE OF TRANSMISSION LINE SYSTEMS TO PULSE EXCITATION BY RADIATION AND INJECTION METHODS

J. SooHoo and M. Bland Jul. 1992 6 p Presented at the 1993 HEART Conference, Orlando, FL, 1-5 Feb. 1993

(Contract W-7405-eng-48)

(DE93-015112; UCRL-JC-111481; CONF-9302120-2) Avail: CASI HC A02/MF A01

Calculated currents and voltages in a transmission line system induced by two different methods of pulse excitation are presented and compared. The two methods under consideration are the radiation and injection methods. Calculations indicate that, for a given set of transmission line parameters and a pulse waveform, these methods generally induce significantly different current and voltage distributions. It also suggests that in general the response of transmission line systems to pulse excitation is sensitive to the incident and polarization angles of the radiation, as well as to the point of injection on the line. While response of transmission line systems to monochromatic-wave excitation is fairly well understood, response to pulse excitation by either the radiation or the injection method had not been sufficiently analyzed and compared in the past. The purpose here is to present a comparison of the currents and voltages that the two methods of excitation would induce in a transmission line system. Mathematically, such a system can be characterized by a set of transmission line equations with source terms proportional to the source pulse of excitation. The currents and voltages then can be calculated by solving the system of equations numerically. In what follows we present calculations for two source pulses, one of which is about 5 nanoseconds in duration and the other about 250 nanoseconds. Both pulses are of the double-exponential form. These two particular pulses were so used in the calculations because they are good approximations to the type of electromagnetic pulses of current interest. DOE

INTENTIONALLY SHORT RANGE COMMUNICATIONS (ISRC) Final Report

J. Yen, P. Poirier, M. E. OBrien, and L. Gibeson May 1993 115 p

(AD-A268788; NRAD-TR-1600) Avail: CASI HC A06/MF A02

This document details the feasibility studies conducted for the Intentionally Short Range Communications (ISRC) project. The short-range limitation arises from the need for low probability of intercept (LPI), low probability of detection (LPD) communication links. The detection of an undecipherable transmission would still provide an enemy with information regarding transmitter location. The technologies being studied are ultraviolet (UV) lamps, UV lasers, infrared (IR) lasers, millimeter waves (MMW), and direct sequence spread spectrum. DTIC

AN/APS-137 FORWARD LOOKING AIRBORNE RADAR (FLAR) EVALUATION SPRING 1992 EXPERIMENT Interim Report, May 1991 - Jan. 1993

R. Q. Robe, K. OBrien, and D. L. Raunig Jan. 1993 65 p

(AD-A268899; CGR/DC-08/93) Avail: CASI HC A04/MF A01

During Apr. 1992, the U.S. Coast Guard R&D Center conducted an experiment to determine the sweep width for the AN/APS-137 Forward Looking Airborne Radar (FLAR) when searching for 4-, 6-, and 10-person life rafts. A total of 507 target detection opportunities were generated for life-raft targets. The experiment was conducted in the coastal waters off the west coast of Florida from Wacussa Bay to Gasparilla Island. Radar searches to collect data used unalerted sensor operators and standard search patterns. Aircraft and target positions were recorded using a Differential Global Positioning System (DGPS). Target detections were recorded by observers on board the aircraft, and environmental conditions were recorded by observers on the workboats. In addition, two MINIMET (TM) environmental buoys recorded the sea and wind conditions in the search area. Environmental conditions represented in the data set included 1.6 to 3.6 foot significant wave heights and 2.9 to 13.0 knot winds. DTIC

THE SPATIAL VARIANCE OF IONOSPHERICALLY-INDUCED PHASE ERRORS IN SAR IMAGERY
W. D. Brown and G. D. Cable 1993 9 p Presented at the 7th International Ionospheric Effects Symposium, Alexandria, VA, 4-6 May 1993
(Contract DE-AC04-76DP-00789)
(DE93-015643; SAND-93-0976C; CONF-9305217-1) Avail: CASI HC A02/MF A01

Images taken with a synthetic aperture radar (SAR) on an airplane were distorted with phase errors generated by a computer program that simulates the propagation of radar waves through the disturbed ionosphere. The simulation is for an orbiting SAR imaging a scene on the ground. Both the spatially-invariant (decorrelation length projected onto the ground much larger than the scene size) and spatially-variant (decorrelation length much smaller than the scene size) cases are described. The spatially-invariant phase errors can be removed using several different algorithms. Problems and strategies in restoring SAR images distorted with spatially-variant phase errors are discussed. RADARC HF IONOSPHERIC PREDICTION PROGRAM FOR OTH RADAR Memorandum Report
D. L. Lucas, G. S. Prinson, J. M. Headrick, and J. F. Thomason 3 Sep. 1993 235 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A269557; NRL/MR/5309-93-7316) Avail: CASI HC A11

A model for predicting the performance of an over-the-horizon high frequency (HF) radar is described. The program can also be used for management of an existing radar or for HF broadcasting assessment. When the radar parameters, such as power, antenna, and frequency are given, the program predicts the signal-to-noise, ground clutter-to-noise, ionospheric spread Doppler clutter-to-noise, and received power as a function of range from the radar site. The report is intended to provide the reader with a general description of the prediction model and to show those mathematics and procedures which are upgraded from NRL Report 2226. The procedures should provide the OTH radar engineers with information to execute the program for studies or evaluation of existing or planned radars. DTIC

A RFI MEASUREMENT SYSTEM FOR FIELD SITES
R. B. Dybdal, G. M. Shaw, and T. T. Mori 1 Sep. 1993 35 p
(Contract F04701-88-C-0089)
(AD-A269340; TR-92(2930)-5; SMC-TR-93-46) Avail: CASI HC A03/MF A01

A compact system has been developed for performing RFI measurements at remote sites. This system covers a 0.5- to 18-GHz frequency range. The system's sensitivity meets or exceeds the sensitivity of a ground terminal when the interfering signals arrive through its wide-angle sidelobes. This sensitivity is achieved with a commercial spectrum analyzer and a specially designed preamplifier system. In addition, a combination of passive bandpass filtering and tuned band-reject filtering preserves the system's linearity when operating, in the presence of strong signals. Example measurements illustrate the operation of this RFI measurement system. DTIC

THE ASYMPTOTIC THEORY OF THE REFLECTION AND TRANSMISSION OF A PULSED ELECTROMAGNETIC BEAM FIELD AT A PLANAR INTERFACE SEPARATING TWO DISPERSIVE MEDIA Final Report, 1 Apr. 1992 - 31 Mar. 1993
Kurt Oughston 21 Mar. 1993 3 p
(Contract F49620-92-J-0206)
(AD-A269033; AFOSR-93-0623TR) Avail: CASI HC A01/MF A01

The long term research goal is to develop a rigorous analytic formulation and, based upon this, a uniform asymptotic description of pulsed electromagnetic beam-field propagation, reflection, and transmission phenomena in causally dispersive dielectric and conducting media. Emphasis has been placed first on a formulation that is rigorously derived from the macroscopic Maxwell's equations with constitutive relations that are appropriate for a homogeneous, isotropic, nonhysteretic, locally linear, and temporally dispersive medium, followed by the development and application of the required uniform asymptotic expansion techniques necessary to yield a completely continuous description of the space-time evolution of the pulsed beam-field at large propagation distances from the input plane. DTIC

N94-18449 Naval Postgraduate School, Monterey, CA.
SPECIFICATION AND ANALYSIS OF A HIGH SPEED TRANSPORT PROTOCOL M.S. Thesis
Huseyin A. Tipici Jun. 1993 95 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A268941) Avail: CASI HC A05

While networks have been getting faster, perceived throughput at the application has not always increased accordingly and the bottleneck has moved to the communications processing part of the system. The issues that cause the performance bottlenecks in the current transport protocols are discussed in this thesis, and a further study on a high speed transport protocol which tries to overcome these difficulties with some unique features is presented. By using the Systems of Communicating Machines (SCM) model as a framework, a refined and improved version of the formal protocol specification is built over the previous work, and it is analyzed to verify that the protocol is free from logical errors such as deadlock, unspecified reception, unexecuted transitions and blocking loops. The analysis is conducted in two phases which consists of the application of the associated system state analysis and the simulation of the protocol using the programming language ADA. The thesis also presents the difficulties encountered during the course of the analysis, and suggests possible solutions to some of the problems. DTIC

DISPERSION EFFECTS ON MILLIMETER WAVELENGTH ATTENUATION EFFICIENCIES FOR A VARIETY OF FIBERS Final Report
C. W. Bruce, A. V. Jelinek, E. Crosby, R. Haloren, and J. Hale Aug. 1993 23 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A268992; ARL-TR-58) Avail: CASI HC A03

Results of several field experiments have been used to determine extinction efficiencies primarily of graphitic fibers and to relate these efficiencies to length distributions. Of the three dispersion techniques employed, two were driven by constant air pressure and the third dispersed fibers by explosive force. Generally, the latter significantly altered the distribution. When a significant proportion of the fibers was fragmented to lengths shorter than a half wavelength, the efficiency decreased notably. Extinction efficiencies for almost all the explosively dispersed clouds were in this category. For frequencies of 35 GHz and lower, efficiencies for explosive dissemination typically were reduced by factors of 2 to 4. Efficiencies at 94 GHz were much less affected because the ratio of particle length to wavelength remained, on the average, higher than one-half. In contrast, length distributions for fibers cut from spools and immediately disseminated by constant air flow almost always sharply peaked near the cut length and had efficiencies near to that calculated for the cut length. Calculations and measurements are in agreement on this issue. DTIC

THEORY OF ELECTROMAGNETIC WAVES PROPAGATING IN NONLINEAR ANISOTROPIC OPTICAL MATERIALS Final Technical Report, 15 Mar. 1991 - 30 Jun. 1993
David S. Moroi 30 Jun. 1993 60 p
(Grant AF-AFOSR-0202-91)
(AD-A269305; AFOSR-93-0678TR) Avail: CASI HC A04/MF A01

Method of multiple scales is used to calculate the electromagnetic fields for first and second harmonics, in first two orders of small parameter expansion, which satisfy the nonlinear coupled wave equations in a chi(2) medium. The results contain no secular terms nor ill-behaved terms. The fields obtained in lowest order calculations are the same as those in slowly varying amplitude approximation. The secular terms and ill-behaved terms resulted in the previous calculations are carefully removed in consistent with this method. We have shown that the first order correction to the electromagnetic field in each harmonic in slowly varying amplitude approximation is down by a factor of 10(exp -5) compared with the leading term. In other words, slowly varying amplitude approximation itself is proven to be a very good approximation. We have estimated the angular deviation of light propagation direction from a straight line in a chi(2) medium which is roughly in a range of 0.2 - 0.6 for an incident laser of intensity 6kW/sq cm. We have obtained the exact coupled differential equations for the amplitudes of the lth confined TE and TM modes for both first and second harmonics in a nonlinear slab waveguide. They become slightly simplified in slowly varying amplitude approximation but still too complicated to be tractable. For a special case of a nonlinear slab waveguide made of material with bar-42m crystalline symmetry, these equations are further simplified. For the case of perfect phase matching or very small phase mismatch and of other specific conditions being met, the equations are reduced to the well-known coupled differential equations which have the solutions given by Jacobian elliptic functions. COMPILATION OF 1992 ANNUAL REPORTS OF THE NAVY ELF COMMUNICATIONS SYSTEM ECOLOGICAL MONITORING PROGRAM, VOLUME 1 Annual Report, Jan. - Dec. 1992
J. E. Zapotosky Aug. 1993 428 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00039-93-C-0001)
(AD-A269569; IITRI-D06205-2-Vol-1) Avail: CASI HC A19

During 1992, the U.S. Navy continued to conduct a program to monitor flora, fauna, and their ecological relationships for possible effects from electromagnetic (EM) fields produced by the Navy's Extremely Low Frequency (ELF) Communications System. Physiological, developmental, behavioral, and ecological variables for dominant biota in upland and riverine habitats near the Naval Radio Transmitting Facility at Republic, Michigan (NRTF-Republic) have been monitored since 1982. The NRTF-Republic was intermittently energized at low amperages beginning in early 1986. Electric current and periods of energization were then gradually increased until 1989, when the transmitter became a fully operational facility. A split-plot or blocked strategy was used to examine biological variables for possible effects from EM exposure. Reports compiled in this document present the progress of these studies through 1992. It is anticipated that data will continue to be collected through 1993. Final results and conclusions are expected after all data have been analyzed in 1994. Investigators for similar studies completed in Wisconsin concluded that there were no EM bioeffects from intermittent or full operation of the transmitter in that state. DTIC

VHF AIR/GROUND COMMUNICATIONS FOR AIR TRAFFIC CONTROL: A DECISION TREE APPROACH TO SYSTEM INNOVATIONS, VOLUME 2
Cheng-Hong Chen, James W. Howland, Robert I. Millar, Brian E. White, and Warren J. Wilson Jul. 1993 275 p
(Contract DTFA01-93-C-0001)
(AD-A268632; MTR-M-93B0000096-Vol-2) Avail: CASI HC A12/MF A03

Improvements to VHF air/ground communications for civil aviation in the 188-137 MHz aeronautical mobile frequency band are systematically explored by means of a decision tree approach. Seven individual papers analyze in detail the operational anitechnical factors involved in making these improvements. Basic tradeoffs between analog and digital modulation are discussed to frame the problem. Near-term improvements utilizing various analog modulations with closer channel spacing are first reviewed. Then far-term improvements employing a wide range of digital modulation and coding techniques are considered. Multiplexing methods - frequency, time, and code division - are discussed in detail. Methods for random access to a shared communications channel are compared, with emphasis upon real-time operation for air traffic control. Volume 1 provides an executive summary of this work, while Volume 2 presents the technical details. DTIC

SIMULATION OF EMITTANCE DILUTION IN ELECTRON STORAGE RING FROM COMPTON BACKSCATTERING
L. N. Blumberg and E. Blum 1993 3 p Presented at the International Particle Accelerator Conference, Washington, DC, 17-20 May 1993
(Contract DE-AC02-76CH-00016)
(DE93-017611; BNL-49166; CONF-930511-302) Avail: CASI HC A01/MF A01

A Monte-Carlo simulation of Compton backscattered kappa(sub L) = 3.2-micron photons from an IR-FEL on 75-MeV electrons in a storage ring yields an RMS electron energy spread of delta(sub E) = 11.9-keV for a sample of 10(exp 7) single scattering events. Electrons are sampled from a beam of natural energy spread sigma(sub E) = 5.6-keV and damped transverse angle spreads sigma(sub x)(prime) = .041-mrad and sigma(sub y)(prime) = .052-mrad (100%) coupling, scaled from the 200-MeV BNL

XLS compact storage ring. The Compton-scattered x-rays are generated from an integral of the CM Klein-Nishina cross-section transformed to the lab. A tracking calculation has also been performed in 6-dimensional phase space. Initial electron coordinates are selected randomly from a Gaussian distribution of RMS spreads sigma(sub xo) = .102-mm, sigma(sub x(prime)o) = .041-mrad, sigma(sub yo) = .018-mm, sigma(sub y(prime)o) = .052-mrad, sigma(sub (phi)o) = 22-mrad and sigma(sub Eo) = 6-keV. A sample of 10000 electrons were each following for 40000 turns around the ring through an RF cavity of f(sub RF) = 211.54-MHz and peak voltage V(sub m)=300-keV. Preliminary results indicate that the resulting energy distribution is quite broad with an RMS width of delta(sub E) = 124-keV. The transverse widths are only slightly increased from their original values, i.e. delta(sub x) = .106-mm and delta(sub x)(prime) = .043 mrad. The scaled energy spread of delta(sub E) approximately = 360-keV for approximately 350,000 turns desired in a 10-msec x-ray angiography exposure is well within the RF bucket used here; even V(sub m) less than 50-kV is adequate. Further, the electron energy spread adds a negligible RMS x-ray energy spread of delta(sub Ex) = .32-keV. The electron energy damping time of tau(sub E) = 379-msec at 75-MeV in an XLS-type ring allows for damping this induced spread and top-off of the ring between heart cycles. DOE

LASER IMAGING RADAR SYSTEM Final Report, Aug. 1989 - Apr. 1993
Steven P. Yun and Robert A. Olson Sep. 1993 63 p
(Contract F08635-90-C-0050)
(AD-A270436; WL-TR-93-7032) Avail: CASI HC A04/MF A01

The simplicity, compactness, and reasonable cost of direct detection diode-laser range finders provide incentive for their use in laser imaging radar systems (LIRS). Efforts have been made to increase range performance of a diode-laser range finder by means of narrow bandwidth operation. This involved narrowing the line width of the diode laser via a narrow bandwidth filter in an external cavity so that it was compatible with a 5 A receiver filter. The narrow bandwidth of the receiver filter limited the amount of solar background radiation incident upon the receiver, thereby increasing the signal-to-noise ratio and thus maximizing the range capability. The study comprised the development and testing of a line-narrowed single-element diode-laser range finder, an analysis of multi-element diode-laser ranger finder, an analysis of multi-element diode-laser geometries, and an experimental evaluation of diode-laser collimation by means of a cylindrical microlens. APPLICATION OF FOURIER-BASED FEATURES FOR CLASSIFICATION OF SYNTHETIC APERTURE RADAR IMAGERY M.S. Thesis
David G. Ehrhard 14 Sep. 1992 95 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A270450; AFIT/CI/CIA-93-108) Avail: CASI HC A05

A method for segmenting synthetic aperture radar (SAR) images has been developed to operate primarily in the frequency domain. It is based on and was tested against a similar method which involves isolating information of the frequency-domain image that defines unique textural features within a class. The comparison involved classifying four simple vegetation SAR scenes with both segmentation methods. A statistical test was then performed against the null hypothesis that the new textural segmentation method is as accurate or more accurate than the original method based on random pixel classification results. All tests concluded that the texture extraction methods are not statistically different. Both methods were implemented on a mainframe computer and are computationally intensive, but the new method may be implemented optically more easily. DTIC

The RF Technology Section of WL/MNGS is developing an in-house capability for modeling and measurement of target scattering and material characteristics at millimeter wave (MMW) frequencies. The goal of the modeling effort is to understand the basic mechanisms that contribute to the target scattering (coated and uncoated) at MMW frequencies. The measurement effort is two-fold: verify theoretical models (target and materials); and assess the effectiveness of actualcountermeasures. The MMW Reflectivity Measurement System (MRMS) is capable of bistatic swept frequency measurements for copolarized (COPOL) transmit and receive signals, and it gives a quick-look capability useful in evaluating countermeasures. The primary goal is the understanding of the various mechanisms that contribute to the scattering in order to develop the algorithms and technology necessary to exploit these effects and improve seeker guidance techniques. This paper discusses the current hardware configuration and planned upgrades and outlines the modeling effort. Examples of the MRMS measurements are compared to theoretical predictions. DTIC

STATISTICAL DESCRIPTION OF THE BISTATIC RADAR CROSS SECTION DISTRIBUTIONS FOR A RIGHT CIRCULAR CYLINDER Report, Jan. 1991 - Apr. 1992
Richard L. Wittschen Jun. 1993 47 p
(AF Proj. 4600)
(AD-A270001; RL-TR-92-159) Avail: CASI HC A03/MF A01

Detection probabilities for monostatic and bistatic radars are compared by computer simulation. The computer generated radar cross section (RCS) of a long thin cylinder is utilized in the computation of detection probabilities for both the monostatic and bistatic configurations. The statistics of the RCS distributions are used to determine the best characterizing function for the cylinder data. It is shown that the beta distribution provides the most accurate description of the cylinder RCS for both configurations. The beta distribution is used as the fluctuation model for the RCS of the cylinder and in the determination of the probability of detection. Comparison of detection probabilities shows that the detection probabilities for large angle bistatic cases are greater than for the monostatic case. DTIC

The CCITT has standardized Group 4 facsimile, and has reached agreement on adding higher resolutions to 400 pels per inch to Group 3 facsimile. In order to measure and verify the quality of transmission for Group 4 apparatus and the advanced resolution Group 3 apparatus, it is necessary to have a standard test chart. The purpose of this project was to complete and obtain reproducible masters and evaluation prints of the printed color chart, and to define the layout and content of the photographically reproduced chart. This report is comprised of four sections. Section 1 provides a brief description of the objective of the study and an outline of the contents of this report. Section 2 discusses the steps taken to produce the final version of the color chart. Section 3 contains the description of the color chart and a guide to its use. Section 4 is a summary of the work performed. DTIC

MORPHOLOGY AND CHARACTERISTICS OF DISTURBED HF SKYWAVE CHANNELS Interim Report
Leonard S. Wagner 3 Sep. 1993 15 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A269755; NRL/MR/5554-93-7389) Avail: CASI HC A03

The normal HF skywave channel is one in which propagation via ionospheric reflection predominates. A disturbed HF skywave channel is defined to be one in which ionospheric scatter plays a significant, often dominant, role in point-to-point radiowave propagation. From a communications perspective, a disturbed channel is one which exhibits reduced signal level in combination with the extensive delay and Doppler spread. Channels which are regularly disturbed include the trans-equatorial, trans-polar and trans-auroral channels. This report covers a number of topics including: (1) measurements that have contributed to our knowledge about the structure and behavior of disturbed channels, (2) solar-terrestrial control factors (e.g., diurnal, seasonal, solar cycle, and geomagnetic), (3) irregularity source regions and current theories of irregularity generation processes, and (4) sample data, available from channel probes, for each of the disturbed channels. EFFECTS OF HARMONICS ON EMI/RFI FILTERS OPERATING UNDER NONLINEAR LOADING CONDITIONS Final Report
Steve J. Briggs, Michael S. Kim, and Franklin H. Holcomb May 1993 41 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A269559; CERL-TR-FE-93/22) Avail: CASI HC A03

Electromagnetic interference/radio frequency interference (EMI/RFI) power-line filters are widely used in the Army for filtering unwanted signals on power lines serving sensitive equipment, particularly computers and communication gear. Typically, these loads are highly nonlinear and cause severe harmonic loading on the filters. Harmonics cause filter failure and shortened filter lifetimes. The objective of this research was to quantify the effects of harmonics and nonlinear loads on EMI/RFI filters and to recommend a derating factor for EMI/RFI filters in nonlinear load applications. EMI/RFI filters were purchased and placed in an experimental apparatus with a known source of harmonics. The filters were instrumented and temperature data was recorded. A mathematical model of the filters was developed and simulations were performed to predict filter failure. The results of the research indicate that filter ampacity should be derated by 50 percent for filters that are being specified for nonlinear loading applications. DTIC

ENVIRONMENTAL CHARACTERIZATION FOR TARGET ACQUISITION. REPORT 3: NEW CONCEPTS FOR EVALUATING LOW-GRAZING ANGLE RADAR MEASUREMENTS
John O. Curtis and Bruce M. Sabol Jun. 1993 249 p
(AD-A269956; WES/TR/EL-93-9) Avail: CASI HC A11/MF A03

In an attempt to develop a scene characterization methodology for long-range (2 to 7 km), low-grazing angle (less than 10 deg or .17 radians) active millimeter wave radar systems, a two-fold approach is taken. First, slant range versus azimuth maps of radar backscatter measurements are filtered to collect statistics on the occurrence of target-like features and to relate those signatures to natural terrain conditions. Second, a prediction of radar return from the terrain is modeled by a point light source at the radar location and the assumption of Lambertian scattering from the terrain facets. Model predictions are combined with overlays of vegetation at each test site and compared qualitatively with the measured data to assess the impact of terrain conditions on backscatter response. These approaches are applied to a set of test site K(a)-band radar measurements made at Fort Hunter Liggett during the winter of 1988. DTIC

NUMERICAL MODELLING OF FRINGING FIELDS AND THEIR USE FOR COMPLEX PERMITTIVITY MEASUREMENTS AT HIGH FREQUENCIES Final Report, Feb. 1992 - Jan. 1993
Camelia Gabriel Mar. 1993 28 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0122-91)
(AD-A270198; AFOSR-93-0706TR) Avail: CASI HC A03

A technique was developed to measure the complex permittivity of materials using an open-ended coaxial probe in contact with a semi-infinite sample. It is based on a rigorous theoretical formulation of the admittance of the probe and was tested by measurements on standard solutions at frequencies of up to 20 GHz. The technique was further used to perform measurements on aqueous ionic solutions. The data were analyzed and used to develop models to predict the dielectric parameters of NaCl and KCl solutions at a given temperature as a function of concentration with the concentration range extending from pure water to saturated salt solutions. The theoretical study and techniques were adapted to the measurement of thin samples in contact with the probe provided they are backed by a metallic plane. The success and range of applicability of the thin sample technique was tested with measurements on standard solutions. Expressions were derived for the electric field in the medium terminating the probe. These expressions were used to determine the pattern of power deposition in the medium terminating the probe. Examples are given to illustrate this statement. DTIC

INTRODUCTION TO WAVELETS
Pankaj N. Topiwala and David Colella Jul. 1993 100 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A268465; M93B0000076) Avail: CASI HC A05

This half-day course on wavelets is intended to be a general introduction to this exciting new topic in signal processing. Wavelets have been proven effective for a number of signal processing tasks, including compression and edge and transient detection. The computational complexity of a wavelet decomposition is O(N), versus O(N log N) for the FFT, making it very competitive. In addition, it has several specific advantages over the FFT in many applications. Two of these applications will be discussed in this course: transient detection and image compression. Wavelets have been applied for a wide variety of tasks, and MITRE has been involved in wavelet research for a number of years, leading to over thirty publications. This course was developed in conjunction with W090 and W096 staff (who ran a successful 3-day wavelet course in Washington), and taught in Bedford by P. Topiwala. This introductory course will be followed by a second course covering the wavelet research and applications currently being developed at MITRE. DTIC

A PARALLEL AND PIPELINED ARCHITECTURE FOR ESTIMATION OF DIRECTION OF ARRIVAL USING A BILINEAR TRANSFORMATION METHOD, VOLUME 3 Final Report
M. M. Jamali, S. C. Kwatra, and Ravindranath Suria Aug. 1993 161 p
(Contract N00014-91-J-1011)
(AD-A270137; DSPH-3-Vol-3) Avail: CASI HC A08/MF A02

High resolution direction-of-arrival (DOA) estimation is important in many sensor systems. It is based on the processing of the received signal and extracting the desired parameters of the DOA of plane waves. The estimation of angle of arrivals of multiple broadband sources has been carried out in a variety of ways over the past few years. In this research an algorithm for broadband DOA estimation using a simple bilinear transformation matrix is investigated and a parallel and pipelined architecture is developed. When compared to other coherent approaches, this algorithm has the advantages of being non-iterative and does not require any initial estimates of the angles of arrival and all angles are computed from a single step of coherent subspace calculations. Hence it is a very suitable algorithm for computation of DOA using dedicated hardware. The advances in the area of Very Large Scale Integration (VLSI) have made it possible to design special purpose hardware which has the advantage of very high speed and overall lower system cost when compared to a system which runs off a general purpose computer. SOLUTION OF THE POISSON EQUATION WITH APPLICATION TO RADAR IMAGING
L. E. Andersson, T. Elfving, and R. Karlsson Nov. 1992 35 p See also PB93-168094
(PB93-195865; FOA-C-30683-3.3) Avail: CASI HC A03/MF A01

In a radar imaging process (the so called CARABAS project) using broad-band, low-frequency waves, the authors encounter the problem of solving Poisson's equation over a very large rectangular grid, typically 5000 x 20000 pixels. In addition, no information about boundary values is available. In order to select suitable solutions the authors solve the Poisson equation under the side condition that some criterion function, usually a Sobolev norm, should be minimized. In some cases this problem may be reformulated as a boundary value problem for the biharmonic equation. Numerical techniques are investigated for this problem. The authors also include the results of some numerical experiments. NTIS

POLARIMETRIC STATISTICS OF ELECTROMAGNETIC WAVES SCATTERED BY DISTRIBUTED TARGETS
S. Axelsson Jan. 1993 132 p See also AD-A193667
(PB93-195907; FOA-C-30656-3.3) Avail: CASI HC A07/MF A02

The variances and correlation coefficients of the instantaneous scattering matrix of the target and the scattered wave are studied first. The probability density functions of the envelopes and the phase difference of the polarization components are analyzed as well. Then the corresponding statistical analysis is applied to the Stokes vector, which can be expressed in terms of the rotation angle and the ellipticity angle of the polarization ellipse. These angles also describe the projection of the Stokes vector on the Poincare sphere. Analytical expressions are derived for the probability density functions of these angles and the mapping of the Stokes vector on the Poincare sphere. Methods of classifying polarimetric radar data and the estimation of optimal polarizations in order to maximize the received power or contrast ratio are also discussed. In the last part of the report, scatter models are analyzed for rough surfaces, clouds of chaff, and man-made targets such as bridges, ships, and vehicles. The target model includes both one-bounce and two-bounce scattering. Finally, a Monte-Carlo model is studied for predictions of the polarization components of the scattered wave when the correlation matrix of the target is known and can be used as input data to the model. APPLICATION OF WAVELET TRANSFORM TECHNIQUES TO SPREAD SPECTRUM DEMODULATION AND JAMMING Final Technical Report, 1 Nov. 1990 - 31 Dec. 1992
Douglas Cochran 26 Feb. 1993 33 p
(Grant AF-AFOSR-0081-91)
(AD-A267389; AFOSR-93-0562TR) Avail: CASI HC A03/MF A01

This project has investigated the application of wavelet methods in spread spectrum communications. Use of the wavelet transform as an alternative to the short-time Fourier and quadratic time-frequency transforms for measuring critical parameters of intercepted slow frequency hopping communication signals has been explored. Direct application of the wavelet transform was found to not offer performance advantages over the Fourieer transform in this application. However, use of the wavelet transform in conjunction with Fourier methods provided an efficient hybrid framework for precise measurement of hopping times and frequencies. A new approach to multiple-access spread spectrum communications was also developed in this project. This approach employs orthogonal wavelets as symbols for encoding digital communication signals. Several users can transmit simultaneously in the same medium using channels defined by wavelet scale in much the same way that channels are defined by frequency in traditional frequency division multiple access. Appropriate choices of wavelet symbols make the transmitted signals robust with respect to detection and jamming. DTIC

THREE DIMENSIONAL MULTIPOLE DECOMPOSITION OF FIELDS
K. Hahn May 1993 5 p Presented at the International Particle Accelerator Conference, Washington, DC, 17-20 May 1993
(Contract DE-AC03-76SF-00098)
(DE93-018530; LBL-33286; HIFAN-571; CONF-930511-322) Avail: CASI HC A01/MF A01

A new method to generate the general multipole representation of the three dimensional static field, electric or magnetic, is obtained via a scalar potential evaluated from the arbitrary specified source. As an application of this formulation, a previously described 3-D electric field decomposition method has been further generalized to the magnetic field. DOE

MOMENTS OF AMBIENT DOPPLER SPECTRA
S. K. Lehman 23 Mar. 1993 17 p
(Contract W-7405-eng-48)
(DE93-017948; UCRL-ID-113761) Avail: CASI HC A03/MF A01

The author studied the first four moments (center of mass, standard deviation, skew, and kurtosis) of the Doppler spectra in ambient regions of LLNL-Hughes real aperture radar data collected during WCSEX91-92. The goal was to correlate trends in the moments with wind velocity and direction. Although the center of mass appears to increase when the wind is blowing into the radar antenna, no other conclusions have been drawn from the higher order moments. DOE

A HIGHLY CONCURRENT MEDIUM ACCESS CONTROL STRATEGY FOR HIGH SPEED MULTIWAVELENGTH NETWORKS USING TRANSCEIVERS WITH LIMITED TUNABILITY
J. H. Laarhuis and A. M. J. Koonen 1993 10 p
(Memo-INF-93-07; TIOS-93-04; ETN-93-94681) Copyright Avail: CASI HC A02/MF A01

High speed multichannel interconnection MAN's (Metropolitan Area Networks) with medium access control mechanisms based on a fixed assignment are considered. A medium access control strategy which accounts for the limited tunability of lasers and filters is proposed. Network performance is achieved by creating disjunct subnetworks in a wavelengtth basis, and reconfiguring them on a time basis. ESA

SPECIFYING AND PROVING COMMUNICATION CLOSEDNESS IN PROTOCOLS
Wil Janssen and Job Zwiers Apr. 1993 31 p Presented at the 13th IFIP Symposium on Protocol Specification, Testing and Verification, Liege, Belgium, 25-28 May 1993 Sponsored in part by Commission of the European Communities
(Memo-INF-93-23; ETN-93-94695) Copyright Avail: CASI HC A03/MF A01

The principle of communication closed layers by Elrad and Francez was shown to be very useful in the design of distributed protocols and algorithms. An investigation of the communication closed layers principle as an 'algebraic law' with 'syntactic' side conditions is presented. Although these side conditions seem to put limits to the applicability, it is shown that by means of multiplexing and data refinement techniques the scope of the law can be enlarged to numerous examples, including the derivation of a Two Phase Commit protocol and the Gallagher, Humblet, and Spira algorithm for minimum weight spanning trees. The relation to more general formulations of the principle of communication closed layers by means of temporal logics and the relation between partial order temporal logics and our process language are also discussed. A PROGRAM FOR PASSIVELY TRACKING A TARGET USING AN ARRAY OF SENSORS
M. R. Buhl Jan. 1993 73 p
(Contract W-7405-eng-48)
(DE93-019554; UCRL-ID-114259) Avail: CASI HC A04/MF A01

The problem of passively tracking a moving signal source has importance in a variety of applications such as radar, sonar, seismology, and radio astronomy. In many applications, only limited information is available about the signal source. It will be assumed here that only the signals which are detected by the sensors and the velocity of the source signal are known. The objective of this document is to present a program which passively tracks a target using an array of sensors. This program is available in MATLAB, version 3.5. The algorithm which is implemented consists of three main parts: time delay estimation, passive localization, and data post processing. Each of these parts are discussed, and the mathematical foundation for their solution given. Following this, the organization of the program is presented, and an example of its usage is given. DOE

BROADBAND IF MATCHING FOR QUASIOPTICAL MIXERS
A. I. Harris, K. F. Schuster, and L. J. Tacconi Jan. 1993 17 p
Submitted for publication
(MPE-Preprint-240; ETN-93-94920) Copyright Avail: Issuing Activity (Max-Planck-Institut fuer Physik und Astrophysik, Giessenbachstrasse, 8046 Garching, Munich, Germany)

The need to drive symmetric quasioptical antennas in a symmetric way to maintain clean antenna patterns recognized by all is discussed. The advantages of bringing out the IF in a symmetric (balanced) way as well are reported. The main difference in IF circuits between waveguide and open structure mixers is that the quasioptical mixers are usually also open at IF wavelengths, so IF currents can flow on the outside of the mixer mounting structures. These surface currents and their associated resonances were measured on a scale model of our mixer block for a 690 GHz SIS mixer. Bringing the IF off the mixer with a balanced circuit solves the surface current problems, yielding a broad bandwidth with predictable impedances. An octave bandwidth IF matching circuit for open structure mixers that incorporates a commercial 180 degree hybrid at cryogenic temperatures was tested. It was found that surface currents are not significant for corner cube mixers because they generate their own balancing currents. ESA

THE SPLIT-STEP ALGORITHM FOR MICROWAVE PROPAGATION MODELING ABOVE A CONDUCTING SURFACE Final Report
M. H. Vogel Feb. 1993 31 p Sponsored by Royal Netherlands Navy, The Hague, Netherlands
(Contract A92/KM/662)
(FEL-92-A430; TD-92-3675; ETN-93-94945) Copyright Avail: Issuing Activity (TNO Physics and Electronics Laboratory, P.O. Box 96864, 2509 JG The Hague, Netherlands)

Microwave propagation in the troposphere is largely dependent on the variation of the air's refractive index with altitude. For a radar system, this strongly affects the probability of detection of a given target. Relevant equations for microwave propagation in a maritime environment are derived and their implementation in a computer code is outlined. Some results of the code are presented. In the implementation of the equation in the computer code, it is assumed that the sea surface is a good conductor and is not very rough. A critical factor in the code is the construction of an absorbing boundary. When the absorption is either too strong or too weak, the results will be in error. A comparison of the results of the code with the PCPEM (personal computer parabolic equation method) microwave propagation calculation program shows good agreement. For higher evaporation ducts there may be discrepancies between the codes. The propagation factor at a certain distance may vary strongly with altitude, and deep nulls may exist, which makes the results of the codes extremely sensitive to the exact receiver height that is chosen. ESA

N94-19449 Physics and Electronics Lab. TNO, The Hague (Netherlands).
A COMPARISON BETWEEN SEVERAL COMPUTER CODES FOR CALCULATIONS ON MICROWAVE PROPAGATION Final Report
M. H. Vogel Mar. 1993 19 p Sponsored by Royal Netherlands Navy, The Hague, Netherlands
(Contract A90/KM/666)
(FEL-92-A435; TD-92-3677; ETN-93-94946) Copyright Avail: Issuing Activity (TNO Physics and Electronics Laboratory, P.O. Box 96864, 2509 JG The Hague, Netherlands)

Microwave propagation in the troposphere is largely dependent on the variation of the air's refractive index with altitude. For a radar system, this strongly affects the probability of detection of a given target. Six computer codes for calculations on microwave propagation are compared. The advantages and disadvantages of each code when used in a maritime environment are discussed. The analyzed codes are: PCPEM (Personal Computer Parabolic Equation Method), EMPE (Electromagnetic Parabolic Equation), RPO (Radio Physical Optics), IREPS (Integrated-Refractive Effects Prediction System), EREPS (Engineers' Refraction Effects Prediction System), and MPPM (Microwave Propagation Prediction Model). EARTH PENETRATION RADAR IMAGING SYSTEM (EPRIS)
Aug. 1993 83 p
(Contract DE-AI01-92EW-50616)
(DE93-019890; DOE/EW-50616/T13) Avail: CASI HC A05/MF A01
(US Sales Only)

The Earth Penetration Radar Imaging System (EPRIS) has been developed and has the capability to detect and locate buried mines, buried ordnance delivered by precision munitions, buried drums, buried waste/contaminants, and geological structures/features. The detected objects or features are mapped in three dimensions with high resolution. This information is then available for integration into a site characterization study. The EPRIS is a significant improvement in non-intrusive sensing and imaging capability. This phase of the EPRIS development has been extremely successful. Coleman Research Corporation (CRC) has implemented significant advances in technology into the EPRIS equipment. The frequency stepped radar sensor design has a very wide dynamic signal range and improved sensitivity over currently available equipment. The two- and three-dimensional image processing algorithms allow high-resolution placement and sizing of buried objects and/or features. The discussions related to the analog-to-digital converter and the spiral antenna, define the source of the dynamic range capability realized by EPRIS. The processing for this new radar makes use of unique synthetic aperature imaging (SAI) algorithms developed by CRC for frequency stepped radar systems. The SAI algorithms are necessary to obtain excellent spatial resolution on objects buried up to seven meters. The sensor signal processing represents a significant improvement in imaging systems. The CRC test facility permitted tests on objects buried up to 2.44 meters. DOE

TRACKING WITH TIME-DELAYED DATA IN MULTISENSOR SYSTEMS Final Report
Richard D. Hilton, David A. Martin, and William D. Blair Aug. 1993 56 p
(AD-A271334; NSWCDD/TR-93/351) Avail: CASI HC A04/MF A01

When techniques for target tracking are expanded to make use of multiple sensors in a multiplatform system, the possibility of time delayed data becomes a reality. When a discrete-time Kalman filter is applied and some of the data entering the filter are delayed, proper processing of these late data is a necessity for obtaining an optimal estimate of a target's state. If this problem is not given special care, the quality of the state estimates can be degraded relative to that quality provided by a single sensor. A negative-time update technique is developed using the criteria of minimum mean-square error (MMSE) under the constraint that only the results of the most recent update are saved. The performance of the MMSE technique is compared to that of the ad hoc approach employed in the Cooperative Engagement Capabilities (CEC) system for processing data from multiple platforms. It was discovered that the MMSE technique is a stable solution to the negative-time update problem, while the CEC technique was found to be less than desirable when used with filters designed for tracking highly maneuvering targets at relatively low data rates. The MMSE negative-time update technique was found to be a superior alternative to the existing CEC negative-time update technique. DTIC

GENERALIZED MULTICHANNEL SIGNAL DETECTION Final Report, Nov. 1992 - Nov. 1993
Robert L. Vienneau, David Dekkers, and Sue Eilers Jul. 1993 41 p
(Contract F30602-92-C-0033)
(AD-A271385; RL-TR-93-154) Avail: CASI HC A03/MF A01

The Multichannel Signal Processing Simulation System (MSPSS) provides the following: a synthesis procedure for simulating multichannel Autoregressive (AR) processes in which intertemporal and interchannel correlations are controlled by specifying signal characteristics such as the one-lag temporal and cross-channel correlation parameters; a capability for analyzing the performance of various multichannel estimation algorithms; and a multichannel signal detection algorithm, based on a generalized likelihood ratio using an innovations approach. Under this effort the MSPSS was enhanced to provide synthesis and analysis of more general processes including multipath and feedback processes, non-Gaussian Spherically Invariant Random Processes, and processes with non-constrained quadrature components. EXPERIMENTAL AND THEORETICAL INVESTIGATION OF BROADBAND HIGH-POWER WINDOWS FOR MILLIMETER WAVES Thesis - Karlsruhe Univ. [EXPERIMENTELLE UND THEORETISCHE UNTERSUCHUNG BREITBANDIGER HOCHLEISTUNGSFENSTER FUER MILLIMETERWELLEN]
U. Ambrosy Feb. 1993 85 p In GERMAN
(KfK-5157; ETN-93-95079) Copyright Avail: CASI HC A05/MF A01

Transmission windows guaranteeing a reliable vacuum air seal for extraction of high power millimeter waves from a vacuum tube oscillator (for example a gyrotron) and for coupling of the wave into an applicator vessel (for example a nuclear fusion reactor) are addressed. The windows used so far usually consist of plane disks of low loss dielectric material mounted perpendicularly to the direction of wave propagation. Since only waves in a narrow frequency range can penetrate this type of window this is only useful for monofrequent systems. For frequency variable systems, using for example step tunable gyrotrons, cyclotron autoresonance masers, or free electron masers as a source, special windows are required, that can transmit a relatively large frequency range (greater than or equal to +/- 5). Different broadband window types are developed and further investigated. The main point of the work is the realization of the required frequency dependences. For the construction of the different test windows materials are used that are suitable for transmission of high power waves. ESA

TRANSIENT SKIN EFFECT IN A MASSIVE CYLINDER BY ECCENTRIC LOCATION OF EXCITING CONDUCTION BANDS Ph.D. Thesis [TRANSIENTER SKINEFFEKT IN EINEM MASSIVEN ZYLINDER BEI EXZENTRISCHER LAGE DER ERREGENDEN LEITERSCHLEIFE]
Ulrich Goelz 1993 98 p In GERMAN Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ETN-93-95048) Avail: CASI HC A05

The transient skin effect in a massive conductive cylinder, located in the field of an eccentrically layered, thin conduction band, is calculated. It was assumed, that field distribution, for any profile of the excitation current, can be calculated provided the solution of the switching process in the folding integral is known. Since the vectorial field equation of the vector potential A cannot be separated in cylindrical coordinates because of the eccentricity, it was necessary to use a superordered vector potential P for the solution of the three dimensional boundary value problem; the vectorial skin effect equation of the vector potential A was reduced to two scalar skin effect equations for two potentials P(w1) and P(w2) so that the field in the cylinder was decomposed into two components. The magnetic field in nonconducting, current free, outspace was described by the superordered scalar potential P(wa). The boundary conditions at the cylinder wall were written as two independent eigenvalues equations. For validation of the calculation, the method was successfully applied to the particular case of a rotation symmetric conduction band. ESA

SYSTEMS ENGINEERING FOR AIR FORCE C3I SYSTEMS
John H. Monahan 1993 212 p
(AD-A270482; M-93-B0000032) Avail: CASI HC A10/MF A03

Each day, sophisticated information systems provide the U.S. with crucial capabilities both to understand the world situation and to react effectively as required by our nation's decision makers. These systems attest to the success of the cooperative efforts of government and industry. Over the last 35 years, to help provide those capabilities, The MITRE Corporation has been privileged to fulfill the role of systems engineer on more than 100 different command, control, communications, and intelligence (C3I) systems for the Air Force and other elements of the Department of Defense (DOD). A long history of successful performance in this broad role provides MITRE with detailed knowledge of the systems' operational capabilities and needs, proficiency in their systems engineering, and a C3I-related corporate memory unmatched by any other organization. That background is the foundation of this book on systems engineering at MITRE. DTIC

SYSTOLIC DESIGN WITH ASYNCHRONOUS CONTROLS FOR DIGITAL-SIGNAL PROCESSING Final Report, 8 Aug. 1991 - 15 Jul. 1993

Kamran Reihani 15 Jul. 1993 34 p
(Contract DAAL03-90-G-0211)
(AD-A270976; PSL-93/49; ARO-28176.9-MA-SAH) Avail: CASI HC A03/MF A01

The research sponsored by this grant is focused on the development of a theoretical and technological basis for designing efficient systolic arrays for digital-signal processing algorithms. The major contributions of the research are the following: data reduction techniques via the utilization of algorithm properties; conversion of sequential input signal into input blocks by means of a spiral systolic mesh that is suitable for parallel processing and that is flexible for enabling various array dimensions; and devising a hybrid of SA and data-flow approach, making data streams independent of computations executed in each processor, thus reducing waiting time. The communication (PE) protocols resolve the data-flow conflicts created by the merging of the spiral and asynchronous systolic array architecture. DTIC

COMPARATIVE EVALUATION OF KIRCHHOFF, PERTURBATION, AND FULL WAVE METHODS FOR ROUGH SURFACE SCATTERING Final Report, May 1990 - Jun. 1993

R. E. Collin 13 Aug. 1993 16 p
(Contract DAAL03-90-G-0122)
(AD-A271198; ARO-27911.4-GS) Avail: CASI HC A03/MF A01

This report summarizes the principal results in three areas of investigation. The first is a new full wave method that takes two dimensional surface roughness into account and does not use the telegraphist's equations. The second study concerns scattering from a rough surface when the incident field is a Gaussian beam. The third is a summary of the difficulties inherent in Bahar's extended full wave theory on which the prediction of enhanced backscatter was based. It was found that enhanced backscatter occurred only because of the invalid assumption that the heights and slopes were uncorrelated. DTIC

SIGNAL PROCESSING ALGORITHMS FOR HETEROGENEOUS ARCHITECTURES Final Report, 1 Jan. 1987 - 31 Oct. 1991

Mary J. Irwin and Robert M. Owens 1 Aug. 1993 34 p
(Contract DAAL03-87-K-0118)
(AD-A271248; ARO-23908.24-EL) Avail: CASI HC A03/MF A01

As stated in our proposal, our research goal was to derive architectures which preserve the VLSI implementation advantages of regular meshes while still obtaining sufficient increases in performance and/or decreases in size and cost. Our problem domain was signal and image processing applications which require either significant computational resources or which must be solved in real time. Our research has been successful in that we have derived a number of such architectures for important problem areas in image and signal processing. These architectures are outlined in more detail in the final report. We even successfully prototyped one of our architectures, the Arithmetic Cube, which involved both VLSI chip and PCB board design and fabrication. The Arithmetic Cube directly solves both the discrete Fourier transform and cyclic convolution. In parallel with our architecture work, we also investigated algorithms which map efficiently onto the various derived architectures and which take advantage of their particular architectural aspects. DTIC

ALGORITHMS AND ARCHITECTURES FOR HIGH SPEED SIGNAL PROCESSING Final Report, 1 May 1990 - 30 Apr. 1993

Thomas Kailath and Arogyaswami Paulraj 31 Jul. 1993 18 p
(Contract DAAL03-90-G-0108)
(AD-A271000; ARO-28060.25-MA) Avail: CASI HC A03/MF A01

This document discusses issues related to designing configurable and fault-tolerant processor arrays such that even if some processors are faulty, a fault free array can be constructed using the healthy processors. The general models that have been explored consist of a set of identical processors embedded in a flexible interconnection structure that is configured in the form of a rectangular grid. In particular, models were studied that use multiple tracks along every grid line. Efficient scheduling algorithms were also developed for such processor arrays in the presence of communication delays. Also discussed are aspects of antenna array processing relating to methods for dealing with unknown or partially known noise field and the array manifold. DTIC

CONGESTION/FLOW CONTROL AND ROUTING IN DATA NETWORKS: A CONTROL-THEORETIC APPROACH Final Report, 1 Apr. 1990 - 31 Mar. 1993

Semyon M. Meerkov and Lotfi Benmohamed 25 Jun. 1993 75 p
(Contract DAAL03-90-G-0094)
(AD-A271121; ARO-27834.1-EL) Avail: CASI HC A04/MF A01

In this project, a novel architecture for congestion control in store-and-forward networks has been developed and design techniques for congestion controllers have been derived. In the framework of this architecture, each switching node is equipped with a congestion controller which calculates the throttled source admission rates using only local information available at the node. Each source receives the throttled admission rates and responds by transmitting with the lowest one. The design methodology developed in this project leads to the choice of the controller gains that ensure a stable congestion-free behavior of the network. No similar results are available in the current literature. DTIC

TEMPLATE BASED LOW DATA RATE SPEECH ENCODER Interim Report

Lawrence Fransen 30 Sep. 1993 15 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A270900; NRL/MR/5531-93-7371) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The 2400-b/s linear predictive coder (LPC) is currently being widely deployed to support tactical voice communication over narrowband channels. However, there is a need for lower-data-rate voice encoders for special applications: improved performance in high bit-error conditions, low-probability-of-intercept (LPI) voice communication, and narrowband integrated voice/data systems. An 800-b/s voice encoding algorithm is presented which is an extension of the 2400-b/s LPC. To construct template tables, speech samples of 420 speakers uttering 8 sentences each were excerpted from the Texas Instrument - Massachusetts Institute of Technology (TIMIT) Acoustic-Phonetic Speech Data Base. Speech intelligibility of the 800-b/s voice encoding algorithm measured by the diagnostic rhyme test (DRT) is 91.5 for three male speakers. This score compares favorably with the 2400-b/s LPC of a few years ago. DTIC

In this report we develop reduced-load approximation techniques based on the stochastic knapsack and the Pascal distribution, which enable the computationally efficient and accurate evaluation of the probability of voice blocking, the probability of data queueing, and the average data delay in integrated voice/data multi-hop radio networks. Monte-Carlo summation techniques are also used to verify the accuracy of the approximations. The reduced-load approximations exhibit excellent to very satisfactory accuracy for the entire range of network and traffic parameters of interest, while the computational effort necessary for their evaluation is substantially lower than that of the exact expressions (which is prohibitive for multi-hop radio networks of even moderate size). They are also used successfully to approximate the derivatives (sensitivities) of the above performance measures with respect to network and traffic parameters. These approximations are applicable to single-rate and multi-rate voice models, as well as to models with voice activity and silence periods. Besides the accurate and time-efficient performance evaluation of integrated voice/data multi-hop radio networks, the computational efficiency and the accuracy of these approximations enables their use for control and optimization purposes. METEOR BURST COMMUNICATIONS IMPROVEMENT STUDY Final Report, Jan. 1989 - Oct. 1992
David Peterson Jul. 1993 158 p
(Contract F30602-89-C-0024)
(AD-A270866; ITT-A/CD-33433A007; RL-TR-93-134) Avail: CASI HC A08/MF A02

Two identical Meteor Burst Radio Terminals were developed, fabricated, and delivered to the Air Force. Each is controlled by a PC computer in a menu driven manner. The mode of operation is full duplex. The RF frequency range is 40 to 60 MHz with tuning increments of 25 KHz. Data rates are 4, 8, 16, 32, 64, 128, 256, and 512 kbps. Modulation is coherent Binary Phase Shift Keying (BPSK) and incoherent Differential Phase Shift Keying (DPSK). Protocol includes Automatic Repeat Request (ARQ) with source and destination addressing, message number, start of message, and end of message. Messages are packetized, and Reed Solomon (R-S) coding is an option. The ARQ is under the control of a Cyclic Redundancy Check Code (CRCC) which detects binary errors within each packet. The terminal is intended to increase meteor trail availability and data throughput by several orders of magnitude--by operating with new antennas that provide much higher gains without sacrificing meteor trail acquisition performance. The automated support during the drafting of outgoing messages and the processing of incoming messages formatted according to the military message system ADatP-3 was studied in order to increase the quality of the information service by an upgrading of message processing capabilities. The ADatP-3 message structure was analyzed. The advantages and disadvantages of ADatP-3 are discussed. The problems are not insurmountable. The message processing functionality, some existing message handling systems, and an automated message handling system are being developed. ESA

PRECISION DIGITALLY-CONTROLLED VARIABLE ATTENUATION CIRCUIT Patent
Kenneth L. Atwood, inventor (to Navy), Hyun S. Kim, inventor (to Navy), and Kang M. Lee, inventor (to Navy) 4 May 1993 9 p Filed 1 Nov. 1991
(AD-D015862; US-Patent-5,208,842; US-Patent-Appl-SN-786665) Avail: CASI HC A02/MF A01

A precise digitally-controlled variable attenuation circuit for adjusting the attenuation of a signal in an external circuit includes a signal magnitude detector, a resistance adjustment control, and a resistance divider network. The signal magnitude detector has lower and upper threshold limits representing a desired range of attenuation and is operable to receive and compare a control signal with the lower and upper threshold limits, and, in response thereto, produce either a first signal if the control signal is less than the lower threshold limit or a second signal if the control signal is greater than the upper threshold limit. The adjustment control is capable of receiving the first and second signals and is operable to produce either a digital count-down signal in response to the first signal or a digital count-up signal in response to the second signal. The resistance divider network has a fixed resistance and a digitally-adjustable device with a variable resistance. DTIC

EXTENDING BANDWIDTH OF OPTICAL EMITTERS USING ACTIVE MATCHING TECHNIQUE Patent
Vladimir Gershman, inventor (to Navy), Afshin S. Daryoush, inventor (to Navy), and Warren A. Rosen, inventor (to Navy) 25 May 1993 14 p Filed 13 Sep. 1991
(AD-D015875; US-Patent-5,214,525; US-Patent-Appl-SN-759296; US-Patent-Class-359-180) Avail: CASI HC A02/MF A01

An optical transmitter particularly suited for high frequency applications is disclosed. The optical transmitter successfully operates in harsh environments such as those found in avionic applications. The optical transmitter employs an LED as a light source which cooperates with an active bandpass amplifier to provide a relatively wide bandwidth from about 250 MHz to about at least 1.35 GHz. The bandpass amplifier is selected to have a slope characteristic which is complementary to a roll-off characteristic of the LED and compensates for the high frequency loss of the LED. The slope characteristic of the bandpass amplifier predominates at the high frequencies of the response of the optical transmitter, whereas the frequency response of the LED dominates at the lower frequencies of the response. THE ANL ELECTRIC VEHICLE BATTERY R&D PROGRAM FOR DOE-EHP
15 Jun. 1993 10 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract W-31-109-eng-38)
(DE93-017414; ANL/CMT/RP-80217) Avail: CASI HC A02

The Electrochemical Technology Program at Argonne National Laboratory (ANL) provides technical and programmatic support to DOE's Electric and Hybrid Propulsion Division (DOE-EHP). The goal of DOE-EHP is to advance promising electric-vehicle (EV) propulsion technologies to levels where industry will continue their commercial development and thereby significantly reduce air pollution and petroleum consumption due to the transportation sector of the economy. In support of this goal, ANL provides research, development, testing/evaluation, post-test analysis, modeling, and project management on advanced battery technologies for DOE-EHP. The battery-related activities undertaken during the period of 1 Jan. 1993 through 31 Mar. 1993 are summarized. The objective, background, technical progress, and status are described for each task. The work is organized into the following task areas: Project Management; Sodium/Metal Chloride R&D; and Microreference Electrodes for Lithium/Polymer Batteries. DOE

DESIGN AND TEST OF A LOW JITTER METAL TO METAL CONTACT SOLID DIELECTRIC SWITCH Ph.D. Thesis
E. E. Domning 1 Mar. 1993 81 p
(Contract W-7405-eng-48)
(DE93-016957; UCRL-LR-112757) Avail: CASI HC A05/MF A01

A low jitter metal to metal contact solid dielectric switch was designed and tested. A metal to metal contact solid dielectric switch with a jitter of less than 25 ns is required for the 150 kJ experiment. Since this is one fourth the 100 ns jitter reported using exploding bridge foil (EBF) triggers, experiments to optimize this trigger were performed. A jitter of 25 ns was achieved using the EBF trigger and it was also achieved using a new type of trigger called the magnetic push trigger. This trigger uses the magnetic force between the two plates of a parallel plate transmission line to push the dielectric. It was found to be better than the EBF trigger because it was easier to design, easier to implement, and did less damage to switch components. DOE

MECHANICALLY REFUELABLE ZINC/AIR ELECTRIC VEHICLE CELLS
J. Noring, S. Gordon, A. Maimoni, M. Spragge, and J. F. Cooper Dec. 1992 4 p Presented at the 183rd Electromechanical Society Meeting, Honolulu, HI, 16-21 May 1993
(Contract W-7405-eng-48)
(DE93-016446; UCRL-JC-112422; CONF-930571-22) Avail: CASI HC A01/MF A01

Refuelable zinc/air batteries have long been considered for motive as well as stationary power because of a combination of high specific energy, low initial cost, and the possibility of mechanical recharge by electrolyte exchange and additions of metallic zinc. In this context, advanced slurry batteries, stationary packed bed cells, and batteries offering replaceable cassettes have been reported recently. The authors are developing self-feeding, particulate-zinc/air batteries for electric vehicle applications. Emissionless vehicle legislation in California motivated efforts to consider a new approach to providing an electric vehicle with long range (400 km), rapid refueling (10 minutes) and highway safe acceleration - factors which define the essential functions of common automobiles. Such an electric vehicle would not compete with emerging secondary battery vehicles in specialized applications (commuting vehicles, delivery trucks). Rather, different markets would be sought where long range or rapid range extension are important. Examples are: taxis, continuous-duty fork-lift trucks and shuttle busses, and general purpose automobiles having modest acceleration capabilities. In the long range, a mature fleet would best use regional plants to efficiently recover zinc from battery reaction products. One option would be to use chemical/thermal reduction to recover the zinc. The work described focuses on development of battery configurations which efficiently and completely consume zinc particles, without clogging or changing discharge characteristics. DOE

A RADIAL TRANSMISSION LINE MATERIAL MEASUREMENT APPARATUS
L. K. Warne, R. D. Moyer, T. E. Koontz, and M. E. Morris May 1993 186 p
(Contract DE-AC04-76DP-00789)
(DE93-018508; SAND-92-2788) Avail: CASI HC A09/MF A02

A radial transmission line material measurement sample apparatus (sample holder, offset short standards, measurement software, and instrumentation) is described which has been proposed, analyzed, designed, constructed, and tested. The purpose of the apparatus is to obtain accurate surface impedance measurements of lossy, possibly anisotropic, samples at low and intermediate frequencies (vhf and low uhf). The samples typically take the form of sections of the material coatings on conducting objects. Such measurements provide the key input data for predictive numerical scattering codes. Prediction of the sample surface impedance from the coaxial input impedance measurement is carried out by two techniques. The first is an analytical model for the coaxial-to-radial transmission line junction. The second is an empirical determination of the bilinear transformation model of the junction by the measurement of three full standards. The standards take the form of three offset shorts (and an additional lossy Salisbury load), which have also been constructed. The accuracy achievable with the device appears to be near one percent. DOE

ANALYSIS OF HIGH CONTACT RESISTANCES ASSOCIATED WITH HERMETIC AND LIGHTNING ARRESTOR CONNECTORS

M. J. Craig Apr. 1993 33 p
(Contract DE-AC04-76DP-00789)
(DE93-014850; SAND-92-2259) Avail: CASI HC A03/MF A01

Contact resistances of greater than 40 milliohms have been associated with hermetic connectors and lightning arrestor connectors (LAC) during routine testing. Empirical analysis demonstrated that the platings could be damaged within several mating cycles. The oxides that formed upon the exposed copper alloy had no significant impact upon contact resistance when the mated contacts were stationary, but effectively disrupted continuity when the mating interfaces were translated. The stiffness of the pin contact was determined to be about five times greater than the socket contact. As the pin contact engages the socket, therefore, the socket spring member deflects and the pin does not deflect. Hence, the pin contact could easily remain centered within the socket cavity in a mated condition, contacting the hemispherical spring at a localized point. Thus the only avenue for electrical conduction is between two contacting curved surfaces -- the pin surface and the socket contact dimple surface. This scenario, coupled with the presence of corrosion products at the contacting interface, presents the opportunity for high contact resistances. DOE

THE AEROCAPACITOR: A CARBON AEROGEL BASED SUPERCAPACITOR

S. T. Mayer, R. W. Pekala, and J. L. Kaschmitter Dec. 1992 22 p
Presented at the 2nd International Seminar on Double Layer-Capacitors and Similar Energy Storage Devices, Deerfield, FL, 7-9 Dec. 1992
(Contract W-7405-eng-48)
(DE93-016537; UCRL-JC-112652; CONF-921232-2) Avail: CASI HC A03/MF A01

During the 1980's, a wide variety of carbon foams, formed by the pyrolysis of polymeric foams, were developed at several Department of Energy Laboratories. These foams are known for their monolithic structure and the ability to tailor their critical parameters (e.g. porosity, density). Lawrence Livermore National Laboratory (LLNL) exclusively developed a unique type of carbon foam, known as carbon aerogels. Carbon aerogels are a special class of open-cell foams with (1) homogeneous ultrafine particle and pore size, (2) very large useful surface area per unit volume, and (3) monolithic structure, that yields (4) excellent electrical conductivity due to the intimate connection of the particles. We have applied carbon aerogels to make an 'Aerocapacitor'; a high power- and energy-density electrochemical double layer capacitor (EDLC) that uses carbon aerogels as electrodes. Carbon aerogel surface areas range from about 100 to 700 m(sup 2)/cc (as measured by BET analysis), with bulk densities of 0.05 to 1.0 g/cm(sup 3) and their morphology allows stored energy to be released rapidly, resulting in high power-densities. DOE

HEAT LOAD ANALYSIS ON THE CABLE-IN-CONDUIT WITH CENTRAL CORE CONDUCTOR FOR THE TF COIL REBUT LAYER DESIGN

A. E. Long (Massachusetts Inst. of Tech., Cambridge.) 23 Sep. 1992 37 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract W-7405-eng-48)
(DE93-013783; UCRL-ID-111589) Avail: CASI HC A03

The current Rebut Layer Design for the ITER TF coil calls for a cable-in-conduit with central core conductor, representing a break from the conventional configuration. In an effort to find the maximum heat load which this conductor can sustain without instigating quench, a model was developed to characterize the heat transfer behavior of the core. This model approximates the superconducting strands as double-sided fins exposed to two separate, parallel liquid helium flows. The model successfully predicts a reasonable value of maximum heat load, and yields results that compare well with a preliminary, computational analysis. The double-sided fin model also provides information on how such geometric parameters as core-to-cable space area ratio and strand winding angle can be adjusted to improve the heat transfer performance of the conductor. Experimental verification of the model is needed to insure compatibility with actual designs. DOE

N94-17882 Lawrence Livermore National Lab., CA.

AEROGELS FOR MICROELECTRONIC APPLICATIONS: FAST, INEXPENSIVE, AND LIGHT AS AIR

R. J. Contolini, L. W. Hrubesh, and A. F. Bernhardt 25 Mar. 1993 4 p
Presented at the NCAIM Workshop, Albuquerque, NM, 30-31 Mar. 1993
Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract W-7405-eng-48)
(DE93-017170; UCRL-JC-113650; CONF-9303198-3) Avail: CASI HC A01

Silica aerogel consists of bonded silicon and oxygen joined into log strands, which are randomly linked together with pockets of air between them. Discovered in the 1930s, the material was thought to have little use outside of theoretical science. However, with the advent of greatly improved processing techniques, such as those developed at Lawrence Livermore National Laboratory, aerogels are on the verge of commercialization. This document describes the need for aerogels in the high-speed microelectronics industry, and state of the art processing techniques. Collaboration is welcomed in the endeavor. DOE

(DLR-Mitt-92-11; ETN-93-94865) Avail: CASI HC A03/MF A01; DLR, Wissenschaftliches Berichtswesen, Postfach 90 60 58, 5000 Cologne 90, Germany, HC

A fast, high resolution, electronic processing and readout unit for phase shifted optical signals, especially from two beam interferometers is described. Over two decades of amplitude and from DC up to several MHz, it produces digital pulses and analog linearized signals between these pulses. The phase difference between the signals was also measured with high resolution. Half automatic signal offset adjustment was done with the first signals received. ESA

N94-17991# Lawrence Livermore National Lab., CA.
LIMITATIONS ON THE FIDELITY OF 100 fs PULSES PRODUCED BY CHIRPED PULSE AMPLIFICATION
W. E. White, F. G. Patterson, L. D. VanWoerkom, D. F. Price, and R. L. Shepherd May 1993 6 p Presented at the Society of Photo-Optical Instrumentational Engineers Meeting, Las Vegas, NV, 6-23 Jan. 1993
(Contract W-7405-eng-48)
(DE93-017167; UCRL-JC-113138; CONF-930192-2) Avail: CASI HC A02/MF A01

A system for continuously variable independent tuning of the higher order frequency dependent phase of ultrashort laser pulses was developed. This technique relies on geometric aberrations that arise from adjustments to the relative alignment of the elements of an air spaced doublet lens in systems such as a diffraction grating stretcher in which the spectral components of the optical pulses are spatially dispersed. Modeling results are compared to experimental measurements for a nonoptimized pulse stretcher/compressor combination showing the higher order phase aberrations that limit the performance of a chirped pulse amplification system. Numerical results are presented indicating these higher order phase terms can be compensated by a properly adjusted air spaced doublet design within the pulse stretcher. DOE

N94-18062 Department of the Navy, Washington, DC.
OPTICALLY CONTROLLED ACTIVE IMPEDANCE ELEMENT AND FILTERS EMPLOYING THE SAME Patent
William D. Jemison, inventor (to Navy) and Peter R. Herczfeld, inventor (to Navy) 20 Jul. 1993 11 p Filed 11 Dec. 1992
(AD-D015863; US-Patent-5,229,665; US-Patent-Appl-SN-989295) Avail: CASI HC A02/MF A01

An optically controlled active impedance element particularly suited to serve as a tuneable inductive element for a microwave oscillator is disclosed. The optically controlled active inductive element is comprised of a circuit arrangement, preferably consisting of MESFET devices which exhibit a composite inductive characteristic, and whose inductance may be determined and controlled by direct illumination impinging on the MESFET's. The optically controlled active inductive element lends itself to being adapted to monolithic microwave integrated circuit (MMIC) applications and may find use in a wide variety of microwave circuits. Also disclosed is an embodiment which uses the optical controlled active impedance element, in a prescribed manner, to serve as a tuneable capacitor for use in various microwave circuits. DTIC

PERFORMANCE EVALUATIONS OF DEMOUNTABLE ELECTRICAL CONNECTIONS
R. C. Niemann, Y. S. Cha, J. R. Hull, W. E. Buckles (Superconductivity, Inc., Madison, WI.), and M. A. Daugherty (Superconductivity, Inc., Madison, WI.) 1993 9 p Presented at the International Cryogenic Engineering Conference and International Cryogenic Materials Conference, Albuquerque, NM, 12-16 Jul. 1993 Limited Reproducibility: More than 20% of this document may be affected by poor print
(Contract W-31-109-eng-38)
(DE93-017399; ANL/ET/CP-78473; CONF-930703-6) Avail: Issuing Activity (Department of Energy (DOE))

Electrical conductors operating in cryogenic environments can require demountable connections along their lengths. The connections must have low resistance and high reliability and should allow ready assembly and disassembly. In this work, the performance of two types of connections has been evaluated. The first connection type is a clamped surface-to-surface joint. The second connection type is a screwed joint that incorporates male and female machine-thread components. The connections for copper conductors have been evaluated experimentally at 77 K. Experimental variables included thread surface treatment and assembly methods. The results of the evaluations are presented. DOE

OPTIMAL DESIGN OF BINARY PHASE-ONLY FILTERS USING GENETIC ALGORITHMS Final Report, Feb. 1992 - Feb. 1993
Kalyanmoy Deb Aug. 1993 55 p
(Contract F08630-92-K-0017)
(AD-A268737; WL-TR-93-7017) Avail: CASI HC A04/MF A01

The genetic algorithm is a mathematical optimization technique which has generally been applied to one-dimensional problems. In this work, the genetic algorithm was applied to a two-dimensional problem--the construction of binary phase-only spatial filters for optical pattern recognition. Spatial filters that are invariant to range and aspect changes are required for robust pattern recognition. Construction of invariant filters is an optimization problem where the correlation is the objective function for the genetic algorithm. Results are presented for correlation of a genetic algorithm-constructed filter with a multiple aspect angle target set. Filters using a hill-climber algorithm were also constructed and tested. DTIC

RF VACUUM MICROELECTRONICS Quarterly Technical Report, 1 Apr. - 30 Jun. 1993
David S. Komm 30 Jun. 1993 8 p
(Contract MDA972-92-C-0034)
(AD-A269454) Avail: CASI HC A02/MF A01

Both masks have been procured and used to fabricate devices. There was no design and procurement activity during this period. Processing was completed in this quarter. One lot of four wafers was processed, two of the wafers in the lot were of sufficient quality to test in vacuum. Test results were mixed, and the devices operated to higher breakdown potentials but emission current levels were not greatly increased. A number of in-situ gas and plasma exposure measurements were performed. A complete description of the test results is given. The first two wafers of a 4 wafer matrix were completed in this quarter. This experiment was basically designed to test and verify some of the early conclusions. The variables under consideration were the following: the dielectric thickness at two levels (5000 A and 10,000 A); the thickness of the gate meal (at two levels); and the aperture size of the emitters. DTIC

WORKSHOP ON MULTIFACTOR AGING MECHANISMS AND MODELS Final Report
V. K. Agarwal 22 Oct. 1992 31 p Workshop held in Victoria, BC, Canada, 22 Oct. 1992
(Contract N00014-92-J-1922)
(AD-A268668) Avail: CASI HC A03/MF A01

There have been considerable efforts to understand the aging and failure mechanisms of insulation in electrical systems. However, progress has been slow because of the complex nature of the subject particularly when dealing with multiple stresses e.g. electrical, thermal, mechanical, radiation, humidity and other environmental factors. When an insulating material is exposed to just one stress factor e.g. electric field, one must devise test(s) which are not only economically efficient and practical but which take into account the nature of electric field (ac, dc and pulsed), duration and level or field strength, and field configurations. Any additional stress factor(s) make the matrix of measurements and the understanding of resulting degradation processes more complex, time consuming and expensive. DTIC

SUPERCONDUCTING/SEMICONDUCTING HYBRIDS AND ADVANCE MEMORY CONCEPTS FOR SUPERCONDUCTING ELECTRONICS Technical Performance Report
M. R. Beasley and M. Horowitz 30 Jul. 1993 5 p
(Contract N00014-92-J-1886)
(AD-A268679) Avail: CASI HC A01/MF A01

The goal of this program is to explore advanced alternatives to the standard approaches to memory in Josephson junction digital electronics. The work includes the physics, circuits and systems aspects of the problem. It is widely recognized that memory is the weak suit of digital superconductive electronics. There are several problems. They are hard to build, particularly at high densities. Their speed is being challenged by leading edge semiconductor memories, albeit at the expense of high power dissipation. They are susceptible to trapped flux, which is both random in space and likely varying in time. All the current approaches to memory are based on the concept of storage of magnetic flux in a superconducting ring first proposed over 25 years ago by Anacker. Basically, there have been no new ideas in superconductive memory since that time. DTIC

(AD-A268844; AFOSR-93-0661TR) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

This is the final technical report for AFOSR Grant No. 91-0260, that began in May 1991 and concluded two years later on 15 May 1993. The first objective of this project was to study the electrical breakdown, due to microwaves, which occurs on the surface of vacuum/atmosphere interfaces. This part of the contract was continuing work started on AFOSR Grant No. 88-102. The second objective of the project was to begin the development of a coaxial vircator. Most of the breakdown results were reported in the previous annual technical report and will only be mentioned briefly. One particular window was tested during the last year of the contract and its results will be detailed in this report. Extensive simulations have been conducted on the coaxial vircator geometry with surprising results. AH of the results from the coaxial vircator simulations are given in this report. DTIC

THE 1991 3RD NASA SYMPOSIUM ON VLSI DESIGN
Gary K. Maki 1991 492 p Symposium held in Moscow, ID, 30-31 Oct. 1991 Sponsored in part by IEEE
(Grant NAGw-3293)
(NASA-CR-194589; NAS 1.26:194589) Avail: CASI HC A21/MF A04

Papers from the symposium are presented from the following sessions: (1) featured presentations 1; (2) very large scale integration (VLSI) circuit design; (3) VLSI architecture 1; (4) featured presentations 2; (5) neural networks; (6) VLSI architectures 2; (7) featured presentations 3; (8) verification 1; (9) analog design; (10) verification 2; (11) design innovations 1; (12) asynchronous design; and (13) design innovations 2. For individual titles, see N94-18338 through N94-18381.

EXPERIENCE WITH CUSTOM PROCESSORS IN SPACE FLIGHT APPLICATIONS c19
M. E. Fraeman, J. R. Hayes, D. A. Lohr, B. W. Ballard, R. L. Williams, and R. M. Henshaw *In* Idaho Univ., The 1991 3rd NASA Symposium on VLSI Design 1991 13 p (For primary document see N94-18337 04-33)
Avail: CASI HC A03/MF A04

The Applied Physics Laboratory (APL) has developed a magnetometer instrument for a swedish satellite named Freja with launch scheduled for August 1992 on a Chinese Long March rocket. The magnetometer controller utilized a custom microprocessor designed at APL with the Genesil silicon compiler. The processor evolved from our experience with an older bit-slice design and two prior single chip efforts. The architecture of our microprocessor greatly lowered software development costs because it was optimized to provide an interactive and extensible programming environment hosted by the target hardware. Radiation tolerance of the microprocessor was also tested and was adequate for Freja's mission – 20 kRad(Si) total dose and very infrequent latch-up and single event upset events. Author (revised)

NEW DYNAMIC FET LOGIC AND SERIAL MEMORY CIRCUITS FOR VLSI GaAs TECHNOLOGY
A. G. Eldin *In* Idaho Univ., The 1991 3rd NASA Symposium on VLSI Design 1991 9 p (For primary document see N94-18337 04-33)
Avail: CASI HC A02/MF A04

The complexity of GaAs field effect transistor (FET) very large scale integration (VLSI) circuits is limited by the maximum power dissipation while the uniformity of the device parameters determines the functional yield. In this work, digital GaAs FET circuits are presented that eliminate the DC power dissipation and reduce the area to 50% of that of the conventional static circuits. Its larger tolerance to device parameter variations results in higher functional yield. Author (revised)

AUTOMATED ILA DESIGN FOR SYNCHRONOUS SEQUENTIAL CIRCUITS
M. N. Liu, K. Z. Liu, G. K. Maki, and S. R. Whitaker *In its* The 1991 3rd NASA Symposium on VLSI Design 1991 12 p (For primary document see N94-18337 04-33)
Avail: CASI HC A03/MF A04

An iterative logic array (ILA) architecture for synchronous sequential circuits is presented. This technique utilizes linear algebra to produce the design equations. The ILA realization of synchronous sequential logic can be fully automated with a computer program. A programmable design procedure is proposed to fullfill the design task and layout generation. A software algorithm in the C language has been developed and tested to generate 1 micron CMOS layouts using the Hewlett-Packard FUNGEN module generator shell. Author (revised)

SINGLE PHASE DYNAMIC CMOS PLA USING CHARGE SHARING TECHNIQUE
Y. B. Dhong and C. P. Tsang *In* Idaho Univ., The 1991 3rd NASA Symposium on VLSI Design 1991 12 p (For primary document see N94-18337 04-33)
Avail: CASI HC A03/MF A04

A single phase dynamic CMOS NOR-NOR programmable logic array (PLA) using triggered decoders and charge sharing techniques for high speed and low power is presented. By using the triggered decoder technique, the ground switches are eliminated, thereby, making this new design much faster and lower power dissipation than conventional PLA's. By using the charge-sharing technique in a dynamic CMOS NOR structure, a cascading AND gate can be implemented. The proposed PLA's are presented with a delay-time of 15.95 and 18.05 nsec, respectively, which compare with a conventional single phase PLA with 35.5 nsec delay-time. For a typical example of PLA like the Signetics 82S100 with 16 inputs, 48 input minterms (m) and 8 output minterms (n), the 2-SOP PLA using the triggered 2-bit decoder is 2.23 times faster and has 2.1 times less power dissipation than the conventional PLA. These results are simulated using maximum drain current of 600 micro-A, gate length of 2.0 micron, V sub DD of 5 V, the capacitance of an input miniterm of 1600 fF, and the capacitance of an output minterm of 1500 fF. AN SEU IMMUNE LOGIC FAMILY
J. Canaris *In its* The 1991 3rd NASA Symposium on VLSI Design 1991 11 p (For primary document see N94-18337 04-33)
(Grant NAGw-1406)
Avail: CASI HC A03/MF A04

A new logic family, which is immune to single event upsets, is described. Members of the logic family are capable of recovery, regardless of the shape of the upsetting event. Glitch propagation from an upset node is also blocked. Logic diagrams for an Inverter, Nor, Nand, and Complex Gates are provided. The logic family can be implemented in a standard, commercial CMOS process with no additional masks. DC, transient, static power, upset recovery and layout characteristics of the new family, based on a commercial 1 micron CMOS N-Well process, are described. Author (revised)

CELLULAR LOGIC ARRAY FOR COMPUTATION OF SQUARES
M. Shamanna, S. Whitaker, and J. Canaris *In its* The 1991 3rd NASA Symposium on VLSI Design 1991 7 p (For primary document see N94-18337 04-33)
(Grant NAGw-1406)
Avail: CASI HC A02/MF A04

A cellular logic array is described for squaring binary numbers. This array offers a significant increase in speed, with a relatively small hardware overhead. This improvement is a result of novel implementation of the formula (x + y)exp 2 = x(exp 2) + y(exp 2) + 2(x)(y). These results can also be incorporated in the existing arrays achieving considerable hardware reduction. Author (revised)

FAULT TOLERANT SEQUENTIAL CIRCUITS USING SEQUENCE INVARIANT STATE MACHINES
M. Alahmad and S. Whitaker *In its* The 1991 3rd NASA Symposium on VLSI Design 1991 12 p (For primary document see N94-18337 04-33)
Avail: CASI HC A03/MF A04

The idea of introducing redundancy to improve the reliability of digital systems originates from papers published in the 1950's. Since then, redundancy has been recognized as a realistic means for constructing reliable systems. A method using redundancy to reconfigure the Sequency Invariant State Machine (SISM) to achieve fault tolerance is introduced. This new architecture is most useful in space applications, where recovery rather than replacement of faulty modules is the only means of maintenance. Author (revised)

VLSI ARCHITECTURES FOR GEOMETRICAL MAPPING PROBLEMS IN HIGH-DEFINITION IMAGE PROCESSING
K. Kim and J. Lee (Houston Univ., TX.) *In* Idaho Univ., The 1991 3rd NASA Symposium on VLSI Design 1991 8 p (For primary document see N94-18337 04-33)
Avail: CASI HC A02/MF A04

This paper explores a VLSI architecture for geometrical mapping address computation. The geometric transformation is discussed in the context of plane projective geometry, which invokes a set of basic transformations to be implemented for the general image processing. The homogeneous and 2-dimensional cartesian coordinates are employed to represent the transformations, each of which is implemented via an augmented CORDIC as a processing element. A specific scheme for a processor, which utilizes full-pipelining at the macro-level and parallel constant-factor-redundant arithmetic and full-pipelining at the micro-level, is assessed to produce a single VLSI chip for HDTV applications using state-of-art MOS technology. PERFORMANCE OF DEFECT-TOLERANT SET-ASSOCIATIVE CACHE MEMORIES
J. F. Frenzel *In its* The 1991 3rd NASA Symposium on VLSI Design 1991 9 p (For primary document see N94-18337 04-33)
(Grant NAGw-1406)
Avail: CASI HC A02/MF A04

The increased use of on-chip cache memories has led researchers to investigate their performance in the presence of manufacturing defects. Several techniques for yield improvement are discussed and results are presented which indicate that set-associativity may be used to provide defect tolerance as well as improve the cache performance. Tradeoffs between several cache organizations and replacement strategies are investigated and it is shown that token-based replacement may be a suitable alternative to the widely-used LRU strategy. SPROC: A MULTIPLE-PROCESSOR DSP IC
R. Davis *In* Idaho Univ., The 1991 3rd NASA Symposium on VLSI Design 1991 10 p (For primary document see N94-18337 04-33)
Avail: CASI HC A02/MF A04

A large, single-chip, multiple-processor, digital signal processing (DSP) integrated circuit (IC) fabricated in HP-Cmos34 is presented. The innovative architecture is best suited for analog and real-time systems characterized by both parallel signal data flows and concurrent logic processing. The IC is supported by a powerful development system that transforms graphical signal flow graphs into production-ready systems in minutes. Automatic compiler partitioning of tasks among four on-chip processors gives the IC the signal processing power of several conventional DSP chips. Author (revised)

AN EXTENDED REED SOLOMON DECODER DESIGN
J. Chen, P. Owsley (Advanced Hardware Architectures, Moscow, ID.), and J. Purviance *In its* The 1991 3rd NASA Symposium on VLSI Design 1991 9 p (For primary document see N94-18337 04-33)
Avail: CASI HC A02/MF A04

It has previously been shown that the Reed-Solomon (RS) codes can correct errors beyond the Singleton and Rieger Bounds with an arbitrarily small probability of a miscorrect. That is, an (n,k) RS code can correct more than (n-k)/2 errors. An implementation of such an RS decoder is presented in this paper. An existing RS decoder, the AHA4010, is utilized in this work. This decoder is especially useful for errors which are patterned with a long burst plus some random errors. Author (revised)

AN IMPROVED DISTRIBUTED ARITHMETIC ARCHITECTURE
X. Guo and D. W. Lynn *In its* The 1991 3rd NASA Symposium on VLSI Design 1991 13 p (For primary document see N94-18337 04-33)
(Grant NAGw-1406)
Avail: CASI HC A03/MF A04

Speed requirements have been, and will continue to be, a major consideration in the design of hardware to implement digital signal processing functions like digital filters and transforms like the DFT and DCT. The conventional approach is to increase speed by adding hardware and increasing chip area. The real challenge is to save chip area while still maintaining high speed performance. The approach we propose is based on the distributed arithmetic implementation (DA) of digital filters. The improvement is based on two observations. Firstly, a single memory element can replace several identical memory elements in a fully parallel DA implementation. Secondly, truncation or rounding may be introduced into the computation at strategic points without increasing error unduly. Both of these approaches can be used to attain area savings without impairing speed of operation. Author (revised)

AN ANALOG RETINA MODEL FOR DETECTING DIM MOVING OBJECTS AGAINST A BRIGHT MOVING BACKGROUND **c61**
R. M. Searfus, M. E. Colvin, F. H. Eeckman, J. L. Teeters, and T. S. Axelrod *In* Idaho Univ., The 1991 3rd NASA Symposium on VLSI Design 1991 12 p (For primary document see N94-18337 04-33)
(Contract W-7405-eng-48)
Avail: CASI HC A03/MF A04

We are interested in applications that require the ability to track a dim target against a bright, moving background. Since the target signal will be less than or comparable to the variations in the background signal intensity, sophisticated techniques must be employed to detect the target. We present an analog retina model that adapts to the motion of the background in order to enhance targets that have a velocity difference with respect to the background. Computer simulation results and our preliminary concept of an analog 'Z' focal plane implementation are also presented. Author (revised)

PULSE-FIRING WINNER-TAKE-ALL NETWORKS **c63**
Jack L. Meador *In* Idaho Univ., The 1991 3rd NASA Symposium on VLSI Design 1991 10 p (For primary document see N94-18337 04-33)
Avail: CASI HC A02/MF A04

Winner-take-all (WTA) neural networks using pulse-firing processing elements are introduced. In the pulse-firing WTA (PWTA) networks described, input and activation signal shunting is controlled by one shared lateral inhibition signal. This organization yields an O(n) area complexity that is convenient for integrated circuit implementation. Appropriately specified network parameters allow for the accurate continuous evaluation of inputs using a signal representation compatible with established pulse-firing neural network implementations. TRAINING PRODUCT UNIT NEURAL NETWORKS WITH GENETIC ALGORITHMS **c63**
D. J. Janson, J. F. Frenzel, and D. C. Thelen *In its* The 1991 3rd NASA Symposium on VLSI Design 1991 8 p (For primary document see N94-18337 04-33)
Avail: CASI HC A02/MF A04

The training of product neural networks using genetic algorithms is discussed. Two unusual neural network techniques are combined; product units are employed instead of the traditional summing units and genetic algorithms train the network rather than backpropagation. As an example, a neural netork is trained to calculate the optimum width of transistors in a CMOS switch. It is shown how local minima affect the performance of a genetic algorithm, and one method of overcoming this is presented. Author (revised)

SYSTOLIC ARRAY IC FOR GENETIC COMPUTATION
D. Anderson *In* Idaho Univ., The 1991 3rd NASA Symposium on VLSI Design 1991 5 p (For primary document see N94-18337 04-33)
Avail: CASI HC A01/MF A04

Measuring similarities between large sequences of genetic information is a formidable task requiring enormous amounts of computer time. Geneticists claim that nearly two months of CRAY-2 time are required to run a single comparison of the known database against the new bases that will be found this year, and more than a CRAY-2 year for next year's genetic discoveries, and so on. The DNA IC, designed at HP-ICBD in cooperation with the California Institute of Technology and the Jet Propulsion Laboratory, is being implemented in order to move the task of genetic comparison onto workstations and personal computers, while vastly improving performance. The chip is a systolic (pumped) array comprised of 16 processors, control logic, and global RAM, totaling 400,000 FETS. At 12 MHz, each chip performs 2.7 billion 16 bit operations per second. Using 35 of these chips in series on one PC board (performing nearly 100 billion operations per second), a sequence of 560 bases can be compared against the eventual total genome of 3 billion bases, in minutes--on a personal computer. While the designed purpose of the DNA chip is for genetic research, other disciplines requiring similarity measurements between strings of 7 bit encoded data could make use of this chip as well. Cryptography and speech recognition are two examples. A mix of full custom design and standard cells, in CMOS34, were used to achieve these goals. Innovative test methods were developed to enhance controllability and observability in the array. This paper describes these techniques as well as the chip's functionality. This chip was designed in the 1989-90 timeframe. Derived from text

HIGH-PERFORMANCE MULTIPROCESSOR ARCHITECTURE FOR A 3-D LATTICE GAS MODEL c60
F. Lee, M. Flynn, and M. Morf *In* Idaho Univ., The 1991 3rd NASA Symposium on VLSI Design 1991 14 p (For primary document see N94-18337 04-33)
(Grant NAGw-419)
Avail: CASI HC A03/MF A04

The lattice gas method has recently emerged as a promising discrete particle simulation method in areas such as fluid dynamics. We present a very high-performance scalable multiprocessor architecture, called ALGE, proposed for the simulation of a realistic 3-D lattice gas model, Henon's 24-bit FCHC isometric model. Each of these VLSI processors is as powerful as a CRAY-2 for this application. ALGE is scalable in the sense that it achieves linear speedup for both fixed and increasing problem sizes with more processors. The core computation of a lattice gas model consists of many repetitions of two alternating phases: particle collision and propagation. Functional decomposition by symmetry group and virtual move are the respective keys to efficient implementation of collision and propagation. Author

CONTROLLING STATE EXPLOSION DURING AUTOMATIC VERIFICATION OF DELAY-INSENSITIVE AND DELAY-CONSTRAINED VLSI SYSTEMS USING THE POM VERIFIER
D. Probst and L. Jensen *In* Idaho Univ., The 1991 3rd NASA Symposium on VLSI Design 1991 8 p (For primary document see N94-18337 04-33)
(Grants A3363; MEF0040121)
Avail: CASI HC A02/MF A04

Delay-insensitive VLSI systems have a certain appeal on the ground due to difficulties with clocks; they are even more attractive in space. We answer the question, is it possible to control state explosion arising from various sources during automatic verification (model checking) of delay-insensitive systems? State explosion due to concurrency is handled by introducing a partial-order representation for systems, and defining system correctness as a simple relation between two partial orders on the same set of system events (a graph problem). State explosion due to nondeterminism (chiefly arbitration) is handled when the system to be verified has a clean, finite recurrence structure. Backwards branching is a further optimization. The heart of this approach is the ability, during model checking, to discover a compact finite presentation of the verified system without prior composition of system components. The fully-implemented POM verification system has polynomial space and time performance on traditional asynchronous-circuit benchmarks that are exponential in space and time for other verification systems. We also sketch the generalization of this approach to handle delay-constrained VLSI systems. Author

HIGH ACCURACY SWITCHED-CURRENT CIRCUITS USING AN IMPROVED DYNAMIC MIRROR

G. Zweigle and T. Fiez *In* Idaho Univ., The 1991 3rd NASA Symposium on VLSI Design 1991 10 p Sponsored in part by NSF (For primary document see N94-18337 04-33)

Avail: CASI HC A02/MF A04

The switched-current technique, a recently developed circuit approach to analog signal processing, has emerged as an alternative/compliment to the well established switched-capacitor circuit technique. High speed switched-current circuits offer potential cost and power savings over slower switched-capacitor circuits. Accuracy improvements are a primary concern at this stage in the development of the switched-current technique. Use of the dynamic current mirror has produced circuits that are insensitive to transistor matching errors. The dynamic current mirror has been limited by other sources of error including clock-feedthrough and voltage transient errors. In this paper we present an improved switched-current building block using the dynamic current mirror. Utilizing current feedback the errors due to current imbalance in the dynamic current mirror are reduced. Simulations indicate that this feedback can reduce total harmonic distortion by as much as 9 dB. Additionally, we have developed a clock-feedthrough reduction scheme for which simulations reveal a potential 10 dB total harmonic distortion improvement. The clock-feedthrough reduction scheme also significantly reduces offset errors and allows for cancellation with a constant current source. Experimental results confirm the simulated improvements. A TUNABLE CMOS CONSTANT CURRENT SOURCE

D. Thelen *In its* The 1991 3rd NASA Symposium on VLSI Design 1991 9 p (For primary document see N94-18337 04-33)

Avail: CASI HC A02/MF A04

A constant current source has been designed which makes use of on chip electrically erasable memory to adjust the magnitude and temperature coefficient of the output current. The current source includes a voltage reference based on the difference between enhancement and depletion transistor threshold voltages. Accuracy is +/- 3% over the full range of power supply, process variations, and temperature using eight bits for tuning. Author

There is recently an increased interest in logic synthesis using EXOR gates. The paper introduces the fundamental concept of Orthogonal Expansion, which generalizes the ring form of the Shannon expansion to the logic with multiple-valued (mv) inputs. Based on this concept we are able to define a family of canonical tree circuits. Such circuits can be considered for binary and multiple-valued input cases. They can be multi-level (trees and DAG's) or flattened to two-level AND-EXOR circuits. Input decoders similar to those used in Sum of Products (SOP) PLA's are used in realizations of multiple-valued input functions. In the case of the binary logic the family of flattened AND-EXOR circuits includes several forms discussed by Davio and Green. For the case of the logic with multiple-valued inputs, the family of the flattened mv AND-EXOR circuits includes three expansions known from literature and two new expansions. Author

ASYNCHRONOUS SEQUENTIAL CIRCUIT DESIGN USING PASS TRANSISTOR ITERATIVE LOGIC ARRAYS

M. N. Liu, G. K. Maki, and S. R. Whitaker *In its* The 1991 3rd NASA Symposium on VLSI Design 1991 14 p (For primary document see N94-18337 04-33)

Avail: CASI HC A03/MF A04

The iterative logic array (ILA) is introduced as a new architecture for asynchronous sequential circuits. This is the first ILA architecture for sequential circuits reported in the literature. The ILA architecture produces a very regular circuit structure. Moreover, it is immune to both 1-1 and 0-0 crossovers and is free of hazards. This paper also presents a new critical race free STT state assignment which produces a simple form of design equations that greatly simplifies the ILA realizations. Author

PULSE MODE VLSI ASYNCHRONOUS CIRCUITS

Q. Chen and G. Maki *In its* The 1991 3rd NASA Symposium on VLSI Design 1991 11 p (For primary document see N94-18337 04-33)

Avail: CASI HC A03/MF A04

A new basic VLSI circuit element is presented that can be used to realize pulse mode asynchronous sequential circuits. A synthesis procedure is developed along with an unconventional state assignment procedure. Level input asynchronous sequential circuits can be realized by converting a regular flow table into a differential mode flow table, thereby allowing the new synthesis technique to be general. The new circuits tolerate 1-1 crossovers. This circuit also provides a means for state sequence detection and real time fault detection. Author

N94-18378*# Idaho Univ., Moscow. NASA Space Engineering Research Center.

IMPROVED SELF ARBITRATED VLSI ASYNCHRONOUS CIRCUITS

P. Winterrowd *In its* The 1991 3rd NASA Symposium on VLSI Design 1991 10 p (For primary document see N94-18337 04-33)

Avail: CASI HC A02/MF A04

This paper introduces an improved method for designing the class of CMOS VLSI asynchronous sequential circuits introduced in the paper by Sterling R. Whitaker and Gary K. Maki, 'Self Arbitrated VLSI Asynchronous Circuits.' Of main interest here is the simple design by inspection rules that arise from these circuits. This paper presents a variation on these circuits which reduces the number of transistors required.

A SPECIAL PURPOSE SILICON COMPILER FOR DESIGNING SUPERCOMPUTING VLSI SYSTEMS **c60**

N. Venkateswaran, P. Murugavel, V. Kamakoti, M. J. ShankarRaman, S. Rangarajan, M. Mallikarjun, B. Karthikeyan, T. S. Prabhakar, V. Satish, and P. R. Venkatasubramaniam et al *In* Idaho Univ., The 1991 3rd NASA Symposium on VLSI Design 1991 15 p (For primary document see N94-18337 04-33)

Avail: CASI HC A03/MF A04

Design of general/special purpose supercomputing VLSI systems for numeric algorithm execution involves tackling two important aspects, namely their computational and communication complexities. Development of software tools for designing such systems itself becomes complex. Hence a novel design methodology has to be developed. For designing such complex systems a special purpose silicon compiler is needed in which: the computational and communicational structures of different numeric algorithms should be taken into account to simplify the silicon compiler design, the approach is macrocell based, and the software tools at different levels (algorithm down to the VLSI circuit layout) should get integrated. In this paper a special purpose silicon (SPS) compiler based on PACUBE macrocell VLSI arrays for designing supercomputing VLSI systems is presented. It is shown that turn-around time and silicon real estate get reduced over the silicon compilers based on PLA's, SLA's, and gate arrays. The first two silicon compiler characteristics mentioned above enable the SPS compiler to perform systolic mapping (at the macrocell level) of algorithms whose computational structures are of GIPOP (generalized inner product outer product) form. Direct systolic mapping on PLA's, SLA's, and gate arrays is very difficult as they are micro-cell based. A novel GIPOP processor is under development using this special purpose silicon compiler. A FAST ADAPTIVE CONVEX HULL ALGORITHM ON TWO-DIMENSIONAL PROCESSOR ARRAYS WITH A RECONFIGURABLE BUS SYSTEM **c61**

S. Olariu, J. Schwing, and J. Zhang *In* Idaho Univ., The 1991 3rd NASA Symposium on VLSI Design 1991 9 p (For primary document see N94-18337 04-33)

(Contract NCC1-99; NSF CCR-89-09996)

Avail: CASI HC A02/MF A04

A bus system that can change dynamically to suit computational needs is referred to as reconfigurable. We present a fast adaptive convex hull algorithm on a two-dimensional processor array with a reconfigurable bus system (2-D PARBS, for short). Specifically, we show that computing the convex hull of a planar set of n points taken O(log n/log m) time on a 2-D PARBS of size mn x n with 3 less than or equal to m less than or equal to n. Our result implies that the convex hull of n points in the plane can be computed in O(1) time in a 2-D PARBS of size n(exp 1.5) x n.

VHDL SIMULATION WITH ACCESS TO TRANSISTOR MODELS

J. Gibson *In its* The 1991 3rd NASA Symposium on VLSI Design 1991 5 p (For primary document see N94-18337 04-33)

Avail: CASI HC A01/MF A04

Hardware description languages such as VHDL have evolved to aid in the design of systems with large numbers of elements and a wide range of electronic and logical abstractions. For high performance circuits, behavioral models may not be able to efficiently include enough detail to give designers confidence in a simulation's accuracy. One option is to provide a link between the VHDL environment and a transistor level simulation environment. The coupling of the Vantage Analysis Systems VHDL simulator and the NOVA simulator provides the combination of VHDL modeling and transistor modeling. Author

SYNTHESIS AND STUDY OF HIGH-T(SUB c) SUPERCONDUCTING ELECTRONIC MATERIALS Final Technical Report, 1 Apr. 1989 - 31 Dec. 1992

Paul M. Tedrow 30 Jul. 1993 11 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(Grant AF-AFOSR-0130-90)

(AD-A268851; AFOSR-93-0658TR) Avail: CASI HC A03

The research program described here was designed to contribute to the evaluation of high T(sub c) superconducting materials for usefulness in electronic circuitry. The experimental techniques emphasized in this plan included electron tunneling and the use of intense magnetic fields to obtain information about the electronic properties of thin films of these materials. The superconductors studied included BiSrCaCuO, NdCeCuO, and BaKBiO. Thin films were formed by pulsed laser ablation, magnetron sputtering, and molecular beam epitaxy. In addition to obtaining electronic transport and tunneling data on these materials, a technique was found to make high-quality superconductor-insulator-superconductor tunnel junctions using artificial grain boundaries. This technique is the only one thus far discovered for making all-thin-film quasiparticle tunnel junctions reliably from high T(sub c) materials. DTIC

ON TIMING FAULTS IN DIGITAL LOGIC CIRCUITS Final Report

Sudhakar M. Reddy 9 Aug. 1993 12 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-90-J-1793)
(AD-A268714) Avail: CASI HC A03

To insure correct operation of digital logic circuits one must ascertain that the circuits perform functionally correct operations, at desired speeds or clock rates. Extensive research has been expended to derive procedures to ascertain the correct functional behavior of logic circuits. For example, procedures to detect line stuck-at faults and other logic faults help identify faulty circuits that do not perform correct functional operations. Relatively much less effort has been expended to derive procedures to ascertain correct operations by digital logic circuit at desired clock rates. Circuit failures causing malfunctions while operating at desired clock rates, but may not at other clock rates, are modeled to test logic circuits to detect and locate delay faults and to develop methods to design logic circuits that are easily testable for delay faults. THE GYROTRON BACKWARD-WAVE-OSCILLATOR EXPERIMENT Final Progress Report, Oct. 1991 - Sep. 1992
T. A. Spencer, C. E. Davis, M. J. Arman, and K. J. Hendricks Jul. 1993 47 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AF Proj. 2301)
(AD-A268982; AD-E201588; PL-TR-93-1011) Avail: CASI HC A03

Experimental and theoretical analyses, including particle-in-cell computer code simulations, are presented for the Gyrotron Backward Wave oscillator (Gyro-BWO) highpower microwave device. The Gyro-BWO has been designed, constructed, and initially tested as a frequency tunable device. The design has concentrated on a TE01, 4- to 6- GHz annular beam device. The annular beam is produced by the RAMBO pulser, which has a diode voltage of -300 to -800 kV and diode current of 1 to 20 kA. Initial results have shown that the device is operating in the backward wave mode. Initial results have also demonstrated that the device is magnetically tunable; that is, the frequency is tunable by adjusting the magnetic field. A Vlasov-type antenna is used for the extraction of the microwave signal on the diode end of the experiment, with initial power extraction of up to 2 MW. DTIC

LOW-NOISE OSCILLATORS FOR AIRBORNE RADAR APPLICATIONS, REVISION 1 Technical Report
Raymond L. Filler and John R. Vig Aug. 1993 20 p
(DA Proj. 1L1-62705-AH-94)
(AD-A269372; SLCET-TR-91-26-REV-1) Avail: CASI HC A03/MF A01

Vibration-induced phase noise can change the probability of detection of moving-target indicator (MTI) radar from near-100 percent to zero. Oscillators that are capable of meeting the requirements of MTI radar systems in a quiet environment are readily available. In the vibrating environments of airborne platforms, however, the phase noise of oscillators degrades very significantly. For example, a 10-MHz crystal oscillator may have a phase noise of -140 dBc/Hz, 100 Hz from the carrier. Assuming a typical one part per billion per g acceleration sensitivity, this phase noise degrades to -93 dBc/Hz under a 0.1 sq g/Hz random vibration at 100 Hz away from the carrier. If there is a 1g sinusoidal vibration at 100 Hz, there will be a pair of -86 dBc spectral lines superimposed on the signal. Of course, upon multiplication to 10 GHz, the phase noise increases by at least another 60 dB. This report reviews the causes and effects of acceleration sensitivity of bulkwave quartz crystal resonators, and the methods that reduce or compensate for that sensitivity. Most of what is discussed is equally relevant to surface acoustic wave (SAW), shallow bulk acoustic wave (SBAW), dielectric resonator-oscillators (DRO), and other types of oscillators. DTIC

JOINT SERVICES ELECTRONICS PROGRAM Final Report, 6 Jun. 1990 - 5 Jun. 1993
Jeffrey Bokor and Michael A. Lieberman 31 Jul. 1993 17 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F49620-90-C-0029)
(AD-A269383; UCB/ERL-90/4; AFOSR-93-0676TR) Avail: CASI HC A03

This report summarizes the research activity supported by the Joint Services Electronics Program at the Electronics Research Laboratory for the period June 1990 to June 1993. It includes the Director's overview, a listing of principal investigators, degrees awarded to students, and a list of publications and presentations. The research was organized into three themes during this period: Quantum Electronic Devices, Semiconductor Electronic Devices, and Neural Networks and Applications. Significant advances were made in all three areas. Under Quantum Electronic Devices considerable progress was made in overcoming the difficulties of realizing surface emitting optoelectronic devices. The novel growth technique of phase-locked epitaxy was developed which allowed for the improvement in the control of layer thicknesses and improved performance of lasers. Under Semiconductor Electronic Devices, success was achieved in the deep sub-micron MOSFET program. Careful analysis of the fundamental issues that limit the continuation of the miniaturization of transistors has been an ongoing activity in this program. In the Neural Network and Applications Area, a prominent feature of the program has been the integration between theory and hardware. Revolutionary new architectures and algorithms for neural networks were investigated and tested on real-world applications, with particular attention given to applications of specific DOD interest. FIELD EMISSION CATHODE AND VACUUM MICROELECTRONIC MICROWAVE AMPLIFIER DEVELOPMENT Technical Progress Report, 1 Jul. 1992 - 31 Mar. 1993
Wayne L. Ohlinger and D. N. Hill 31 Mar. 1993 55 p
(Contract MDA972-91-C-0034)
(AD-A269526) Avail: CASI HC A04/MF A01

The objective of this report is to summarize progress, indicate problem areas that have been addressed, outline plans for future work, and to discuss, in a realistic manner, the likelihood that the proposed work will be completed in a reasonable time frame. Although we knew that the growth of the ZrO2 (center dot) Y2O3-W (ZYW) composite was far from an exact science, we felt that we could build on prior work in this area and make rapid progress toward solving some problems. However, a few of these problems, particularly that of banding in the structure (discontinuities in the growth of the tungsten fibers) proved to be more recalcitrant than expected. Nevertheless, an adequate amount of material with continuous fiber growth has now been made to fabricate a sufficient supply of samples to complete the proposed work. The composite growth work is discussed. Etching of the composites also proved more difficult than anticipated. Plasma etching was investigated, which may eventually provide better, and more uniform, pin tip geometries than were ever available with the chemical etches. LVFE structure development is recounted. Most of the work on emission testing has been associated with the set-up of a vacuum test station, design and assembly of a test vehicle, and collection of the associated electrical equipment needed for both the CW and RF electrical tests of the field emission cathodes. The task objective was to provide rapid access to cost effective, state-of-the-art U.S. microelectronics industry fabrication technology for DoD customers and the educational community. This access was provided through the establishment of a prototyping service for use by the DARPA and NSF research communities which offered access to a variety of technologies unobtainable from a single fabrication source. The Defense Advanced Research Projects Agency (DARPA) had the goal of providing state-of-the-art VLSI fabrication services and electronic systems assembly technology to DoD customers and the educational community to ensure that DoD has access to low-cost, advanced electronic assemblies and to ensure that the country's newly emerging engineers will be able to support military needs in the area of electronics. The first task was to provide VLSI fabrication to DoD and DARPA supported contractors who have need of custom chips and assemblies. The second task was to provide this same technology to NSF-sponsored activities, under DARPA guidance. DTIC

DESIGN AND SIMULATION OF A GALLIUM-ARSENIDE SECOND ORDER SIGMA-DELTA ANALOG TO DIGITAL CONVERTER Final Report, 4 Jan. - 16 Aug. 1993

Raymond E. Siferd and Eric W. Mahurin 16 Aug. 1993 64 p
(Contract F33615-92-C-1056)
(AD-A269494; WL-TR-93-5028) Avail: CASI HC A04/MF A01

In this report, the design and simulation of a sigma-delta analog-digital converter is presented. The key to sigma-delta conversion is trading off time resolution for amplitude resolution. In this report, second-order converters are used which allows the amplitude resolution to increase several times faster than the time resolution decreases. The sigma-delta modulator contains two basic components--an analog sigma-delta modulator and a digital low-pass filter. The modulator generates a stream of bits representing the analog input. The low-pass filter takes out the high frequency variations in this bit stream and generates a stream of multi-bit words. The report shows the designs and simulations of two different second-order sigma-delta modulators. Both of these circuits use Gallium-Arsenide MESFET technology to achieve an oversampled clock rate of 512-MHz. The first modulator contains unique integrators based on the square law of field effect transistors (FET's). The second modulator contains integrators using single-stage op-amps, current sources, and current sinks. Both modulators contain a unique clocking scheme that allows the continuous-time integrators to be insensitive to the delay of the quantizers. DTIC

N94-18706 California Univ., Los Angeles.

VLSI FOR HIGH-SPEED DIGITAL SIGNAL PROCESSING Report, 1 Oct. 1992 - 30 Sep. 1993

Alan N. Willson, Jr. 30 Sep. 1993 13 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-91-J-1852)
(AD-A270406) Avail: CASI HC A03

During the past quarter we have completed the testing of our recently fabricated single-processor IC. This is the last preliminary chip we intend to fabricate before fabricating our full five-processor ring IC. Its primary purpose is to verify that all aspects of our ALU, program and coefficient RAM's, and Register Blocks are functioning correctly. The chip provides for 11-bit input and output data with 16-bit internal data and 11-bit coefficients (stored in on-chip memory). The chip also has an 8-bit microprocessor bus interface for loading programs and coefficients. The IC contains 25,000 transistors and occupies an area of 14.8 mm squared (3.7 mm by 4.0 mm including pads) in 1.2 micron CMOS technology. DTIC

N94-18709 California Univ., Los Angeles.

PROGRAMMABLE LINEAR PHASE DIGITAL FILTERS Report, 1 Oct. 1992 - 30 Sep. 1993

THE LEVER OSCILLATOR FOR USE IN HIGH RESISTANCE RESONATOR APPLICATIONS

K. O. Wessendorf 1993 7 p Presented at the 1993 IEEE Frequency Control Symposium, Salt Lake City, UT, 2-4 Jun. 1993
(Contract DE-AC04-76DP-00789)
(DE93-017652; SAND-93-0145C; CONF-9306205-1) Avail: CASI HC A02/MF A01

The Lever oscillator has been specifically designed for use with quartz resonator sensors. The use of quartz resonators as sensors is of particular interest and depending on the sensing environment, e.g., liquid, the oscillator design is both critical and difficult due to the wide dynamic range of resonator resistance possible due to damping of the resonator. Standard oscillator designs do not work well as sensor oscillators. An oscillator design will be presented that allows both frequency and loss (R(sub m)) of the resonator to be determined over a wide dynamic range of resonator loss. The Lever oscillator uses negative feedback in a differential amplifier configuration to actively and variably divide (or leverage) the resonator impedance such that the oscillator can maintain the phase and gain of the loop over a wide range of resonator resistance. DOE

NOVEL ELECTRON BEAM CATHODE Final Report, 20 Jan. 1992 - 20 Apr. 1993

K. J. Hendricks, D. E. Voss, E. Garate, R. McWilliams, and T. A. Spencer Jul. 1993 12 p
(AD-A270106; AD-E201616; PL-TR-93-1024) Avail: CASI HC A03/MF A01

Experiments have been conducted during the past year to develop an electron beam cathode which is capable of producing a moderate perveance beam for several microsecond pulse lengths and is not susceptible to diode closure. The requirements, successfully met by this salt-based cold emission cathode, include operating in modest vacuums of 10-5 Torr, voltages less than or equal 160 kV, and the ability to generate solid or annular cross section space-charge-limited electron beams. Data on the operating performance of this salt cathode and streak photographs showing the uniformity of the emission of the electron beam are presented.

Comparisons of this salt cathode will be made with other electron beam cathode materials. DTIC

ULTRAFAST ELECTRONICS AND OPTOELECTRONICS: SUMMARIES OF PAPERS. TECHNICAL DIGEST CONFERENCE EDITION Final Report

Jarus W. Quinn Jan. 1993 213 p Meeting held in San Francisco, CA, 25-27 Jan. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AF Proj. 2301)
(AD-A269233; AFOSR-93-0640TR) Avail: CASI HC A10

The symposium was held on the following topics: advanced solid state lasers, compact blue-green lasers, integrated photonics research, nonlinear guide-wave optics, optical amplifiers and their applications, optical design for photonics, photonics in switching, quantum optoelectronics, short-wavelength -- physics with intense laser pulses, soft x-ray protection lithography, ultrafast electronics and optoelectronics, optical computing, and spatial light modulators. ENVIRONMENTALLY ASSISTED CRACKING OF NICKEL ANODE SUBSTRATES IN LI/SOCI2 CELLS: AN ENGINEERING APPROACH

W. R. Cieslak, D. E. Weigand, and R. G. Buchheit 1993 2 p Presented at the 184th Meeting of the Electrochemical Society, New Orleans, LA, 10-15 Oct. 1993
(Contract DE-AC04-76DP-00789)
(DE93-015130; SAND-93-1083C; CONF-931024-1) Avail: CASI HC A01/MF A01

Intergranular environmentally assisted cracking (EAC) of Ni anode substrates is likely to occur in a large proportion of Li/SOCl2 cells, but it is not generally detected because in the majority of cases it does not lead to catatrophic failure. However, EAC could become a problem for applications requiring continuous power with high reliability for 10-15 years. In the present work, we determine why simple galvanic couple constant-strain tests do not produce cracking and introduce a constant strain test that does produce cracking. The objective of this investigation is to determine the stress threshold for cracking as a function of Ni composition and microstructure. DOE

INTEGRATED CIRCUITS: RESISTLESS PROCESSING SIMPLIFIES PRODUCTION AND CUTS COSTS

K. Weiner 25 Mar. 1993 4 p Presented at the National Center for Advanced Information Components Manufacturing Workshop, Albuquerque, NM, 30-31 Mar. 1993
(Contract W-7405-eng-48)
(DE93-018069; UCRL-JC-113651; CONF-9303198-4) Avail: CASI HC A01/MF A01

Reducing the complexity and cost of producing deep-submicrometer integrated circuits (IC's) will soon be possible using a revolutionary approach being developed at the Lawrence Livermore National Laboratory (LLNL). Resistless Projection Doping (RPD) will eliminate the need for photoresist processing during the impurity doping step. This single innovation will reduce the doping sequence from 13 steps to 1 and eliminate the need for five pieces of capital equipment costing more than $5 million. The overall cost of high-volume wafer fabrication will be reduced by more than 10 percent. In addition, the LLNL RPD machine is compact and modular, minimizing facilities costs when compared to today's industry-standard doping equipment. These physical characteristics of the machine also allow the RPD process to be easily incorporated into single-wafer, 'cluster' processing tools. When integrated with existing deposition, etching, and annealing steps and developing lithography techniques, the LLNL doping process completes the technology set required to produce a flexible fabrication facility of the future. At one-fifth the cost of current mega-fabrication facilities, the availability of these compact, low-volume, smart factories will give US manufacturers a substantial competitive advantage in the world-wide marketplace for high-value custom and semi-custom integrated circuits. DOE

CONCEPTUAL DESIGN OF A SODIUM SULFUR CELL FOR US ELECTRIC VAN BATTERIES

Peter J. Binden (Beta Power, Inc., Wayne, PA.) May 1993 52 p
(Contract DE-AC04-76DP-00789)
(DE93-018683; SAND-92-7331) Avail: CASI HC A04/MF A01

A conceptual design of an advanced sodium/sulfur cell for US electric-van applications has been completed. The important design factors included specific physical and electrical requirements, service life, manufacturability, thermal management, and safety. The capacity of this cell is approximately the same as that for the PB cell being developed by Silent Power Limited (10 Ah). The new cell offers a 50% improvement in energy capacity and nearly a 100% improvement in peak power over the existing PB cells. A battery constructed with such cells would significantly exceed the USABC's mid-term performance specifications. In addition, a similar cell and battery design effort was completed for an advanced passenger car application. A battery using the van cell would have nearly 3 times the energy compared to lead-acid batteries, yet weigh 40% less; a present-day battery using a cell specifically designed for this car would provide 50% more energy in a package 60% smaller and 50% lighter. DOE

SUPERCONDUCTING FLUX FLOW DEVICES, DIGITAL CIRCUITS AND MEMORIES

J. S. Martens (Conductus, Inc., Sunnyvale, CA.), M. E. Johansson (Conductus, Inc., Sunnyvale, CA.), A. Pance (Conductus, Inc., Sunnyvale, CA.), V. M. Hietalia, J. R. Wendt, G. A. Vawter, T. A. Plut, C. P. Tigges, M. P. Siegal, and S. Y. Hou (Bell Telephone Labs., Inc., Murray Hill, NJ.) 1993 9 p Presented at the 183rd Electrochemical Society Meeting, Honolulu, HI, 16-21 May 1993
(Contracts DE-AC04-76DP-00789; N00014-91-F-0055)
(DE93-019072; SAND-92-2257C; CONF-930571-26) Avail: CASI HC A02/MF A01

Flux flow based devices have advanced to the point where real digital circuits can be considered that have attractive speed and power properties. An ECL-like logic family has been developed with sub-10 ps gate delays with fan-outs of 5 or more. Adders with 25 ps delays and 30 nW static power dissipation have also been demonstrated. These logic families enable a hybrid memory concept with extremely low power needs and access times of a few hundred ps. DOE

SILICON MCM SUBSTRATES FOR INTEGRATION OF 3-5 PHOTONIC DEVICES AND CMOS IC'S

P. Seigal, R. Carson, R. Flores, and B. Rose 1993 10 p Presented at the International Workshop on Optoelectronic Packaging Science, Santa Barbara, CA, 28 Jul. 1993
(Contract DE-AC04-76DP-00789)
(DE93-017894; SAND-93-1773C; CONF-9307112-1-Vugraphs) Avail: CASI HC A02/MF A01

The progress made in advanced packaging development at Sandia National Laboratories for integration of 3-5 photonic devices and CMOS IC's on Silicon MCM substrates for planar aid stacked applications will be reported. Studies to characterize precision alignment techniques using solder attach materials compatible with both silicon IC's and 3-5 devices will be discussed. Examples of the use of back-side alignment and IR through-wafer inspection will be shown along with the extra processing steps that are used. Under bump metallurgy considerations are also addressed. DOE

A PROGRAMMABLE SYSTOLIC TRIGGER PROCESSOR FOR FERA-BUS DATA

G. Appelquist, B. Hovander, B. Sellden, and C. Bohm Sep. 1992 16 p
(USIP-92-04; ETN-93-94847) Avail: CASI HC A03/MF A01

A generic CAMAC based trigger processor module for fast processing of large amounts of Analog to Digital Converter (ADC) data was designed. This module was realized using complex programmable gate arrays. The gate arrays were connected to memories and multipliers in such a way that different gate array configurations can cover a wide range of module applications. Using this module, it is possible to construct complex trigger processors. The module uses both the fast ECL FERA bus and the CAMAC bus for inputs and outputs. The latter is used for set up and control but may also be used for data output. Large numbers of ADC's can be served by a hierarchical arrangement of trigger processor modules which process ADC data with pipeline arithmetics and produce the final result at the apex of the pyramid. The trigger decision is transmitted to the data acquisition system via a logic signal while numeric results may be extracted by the CAMAC controller. The trigger processor was developed for the proposed neutral particle search. It was designed to serve as a second level trigger processor. It was required to correct all ADC raw data for efficiency and pedestal, calculate the total calorimeter energy, obtain the optimal time of flight data, and calculate the particle mass. A suitable mass cut would then deliver the trigger decision. ESA

CONTRIBUTION TO THE STUDY OF THE ADDITIONAL LOSSES IN COIL ELEMENTS USED IN STATIC CONVERTERS Ph.D. Thesis [CONTRIBUTION A L'ETUDE DES PERTES SUPPLEMENTAIRES DANS LES ELEMENTS BOBINES UTILISES DANS LES CONVERTISSEURS STATIQUES]

Mohamed Ould-Khouna 1992 124 p In FRENCH
(ECL-92-60; ETN-93-94892) Avail: CASI HC A06/MF A02

The objective is to explain the physical mechanisms responsible for losses. Theoretical models to be used as base data for optimizing such constraints in static converters are developed. Frequencies from a few Hz to tens of kHz within a power range from a few kVA to tens of kVA are considered. Emphasis is placed on currents induced in conductors, in particular their distribution in the different coils constituting a winding. The study is carried out using flexible electromagnetic models which facilitate the analysis of the influence of main parameters on the secondary losses. They are then subjected to experimental measurements and numerical simulations using finite elements method. ESA

IMPEDENCE CALCULATION WITH RECURSIVE FOLDING Ph.D. Thesis [IMPEDANZBERECHNUNG MIT HILFE DER REKURSIVEN FALTUNG]

Klemens Ahrens 1993 142 p In GERMAN
(ETN-93-95049) Avail: CASI HC A07/MF A02

A method, based on the folding integral for solving the first order differential equation which mathematically describes the short circuit path, is presented. The distance to the short circuit location could be calculated with only two scan values, when no light arc errors and no compensation processes, due to band capacities, occur. It is noticed that the evaluation of input and output quantities always gives the same weight function for a time invariant linear system; this property allows the solution to be not influenced by the overoscillations of the active network. Earth capacities of the short circuited transmission line or light arc faults were taken into account through calculations performed with the error quadratic sum as optimization criterion. This structure of the distance protection algorithm allows the most important perturbation sources on the travelling waves to be considered. The recursive folding was compared with other usual algorithms in terms of secondary lines perturbation, digital processing, calculation time needs and filter properties; it is concluded that the method is fast and evolutive. COMPARATIVE EXAMINATIONS OF SEVERAL FIELD ORIENTED POSITION CONTROL STRUCTURES FOR ASYNCHRONOUS SERVOMOTORS WITH A MULTITRANSPUTER SYSTEM Ph.D. Thesis [VERGLEICHENDE UNTERSUCHUNGEN VON UNTERSCHIEDLICHEN FELDORIENTIERTEN LAGEREGLERSTRUKTUREN FUER ASYNCHRON-SERVOMOTOREN MIT EINEM MULTI-TRANSPUTER-SYSTEM]

Stefan Beierke 1993 153 p In GERMAN
(ETN-93-95051) Avail: CASI HC A08/MF A02

The design and the realization of a universal development platform and the identification and the adaption of the electrical motor parameters are investigated. The asynchronous machine was mathematically described and field oriented model was decoupled and linearized. Short circuit current and transient response of the asynchronous machine were determined. A multitransputer development platform was realized; characterized by high flexibility, good extension possibilities, and high calculation power. Three position regulation structures for field oriented control of squirrel cage asynchronous machines were experimentally confronted: cascade, state, and cascade state controls. Practical examinations of cascade regulation show the influence of control cycle time and scan ratio of control lines on drive behavior of the regulation system. A parameter sensitivity analysis was carried out in order to determine the influence of stator inductivity, inertia momentum, and rotor time constant, which was adapted with an online identification process based on reactive power balance. Simulations of dynamic control behavior show cascade state control as the best. ESA

MODELING AND CHARACTERIZATION OF MECHANOELECTRIC CONVERSION PIEZOELECTRIC GENERATORS THROUGH DYNAMICAL OR QUASI STATIC UNIAXIAL STRESS Ph.D. Thesis [MODELISATION ET CARACTERISATION DES GENERATEURS PIEZOELECTRIQUES DE CONVERSION MECANOELECTRIQUE PAR COMPRESSION UNIAXIALE DYNAMIQUE OU QUASI-STATIQUE]

Christian Garabedian 1992 276 p In FRENCH
(ISAL-92-0097; ETN-93-95013) Avail: CASI HC A13/MF A03

Mechanoelectric conversion is recalled and a means of determining electrical parameters is considered in order to characterize the piezoelectric element under dynamic stress. The incoherence between the values of low level coefficients and those calculated from experiments led to the proposal of a more complex model whose equivalent schema take into account the mechanical and dielectrical losses in the material and the mechanical environment in which the piezoelement is found. This model permitted, with the aid of simulation software, the characterization of ceramic under high level mechanical solicitation, in dynamic stress and to calculate the nonlinearities. The analysis of the slow stress is carried out. The bringing into evidence of the residual field in the piezoelectric element enabled the redefinition of the electric energy value delivered in a line of sparks on a relaxation-stress cycle, and the definition for a given composition, of the optimal interelectrode distance. The two modes of conversion were compared and the formulation to obtain the maximal electric energy is determined. ESA

SILICON COMPILATION: FROM THE CIRCUIT TO THE SYSTEM Ph.D. Thesis [COMPILATION DE SILICIUM: DU CIRCUIT AU SYSTEME]

Keven OBrien 1993 196 p In FRENCH
(ETN-93-95010) Avail: CASI HC A09/MF A03

The methodology used for the compilation of silicon from a behavioral level to a system level is presented. The aim was to link the heretofore unrelated areas of high level synthesis and system level design. This link will play an important role in the development of future design automation tools as it will allow hardware/software co-designs to be synthesized. A design methodology that alllows, through the use of an intermediate representation, SOLAR, a System level Design Language (SDL), to be combined with a Hardware Description Language (VHDL) is presented. Two main steps are required in order to transform this specification into a synthesizable one. Firstly, a system level synthesis step including partitioning and communication synthesis is required in order to split the model into a set of interconnected subsystems, each of which will be processed by a high level synthesis tool. For this latter step AMICAL is used and this allows powerful scheduling techniques to be used, that accept very abstract descriptions of control flow dominated circuits as input, and interconnected RTL blocks that may feed existing logic-level synthesis tools to be generated. QUASI-OPTICAL TRANSPONDER USING FET'S AND PATCH ANTENNAS
Kimin Cha and Tatsuo Itoh 30 Jul. 1993 52 p
(Contract DAAH04-93-G-0068)
(AD-A271339; UCLA-Eng-93-48; ARO-30921.9-EL) Avail: CASI HC A04/MF A01

Quasi-optical planar transponder that integrates a self-oscillating mixer, an IF amplifier and two patch antennas, one for receiving RF signal (14GHz) and another for transmitting amplified IF signal (8GHz) is presented. The prototype circuit is designed in microstrip structure and fabricated on a single substrate. As an active source, GaAs FET is selected. Self-oscillating (6GHz) mixer with patch antenna in receiver front end is developed based on quasi-optical technique. To obtain enough power level of IF signal before it is transmitted, the amplifier is designed with bandpass filter which blocks undesirable mixing products except 8GHz. This prototype of transponder, which is compact and self-contained unit as a single entity has many applications in microwave and millimeter-wave area. DTIC

DESIGN OF POWER ELECTRONICS FOR TVC EMA SYSTEMS Final Report
R. Mark Nelms 30 Aug. 1993 62 p
(Contract NAS8-39131)
(NASA-CR-193839; NAS 1.26:193839) Avail: CASI HC A04/MF A01

The Composite Development Division of the Propulsion Laboratory at Marshall Space Flight Center (MSFC) is currently developing a class of electromechanical actuators (EMA's) for use in space transportation applications such as thrust vector control (TVC) and propellant control valves (PCV). These high power servomechanisms will require rugged, reliable, and compact power electronic modules capable of modulating several hundred amperes of current at up to 270 volts. MSFC has selected the brushless dc motor for implementation in EMA's. This report presents the results of an investigation into the applicability of two new technologies, MOS-controlled thyristors (MCT's) and pulse density modulation (PDM), to the control of brushless dc motors in EMA systems. MCT's are new power semiconductor devices, which combine the high voltage and current capabilities of conventional thyristors and the low gate drive requirements of metal oxide semiconductor field effect transistors (MOSFET's). The commanded signals in a PDM system are synthesized using a series of sinusoidal pulses instead of a series of square pulses as in a pulse width modulation (PWM) system. A resonant dc link inverter is employed to generate the sinusoidal pulses in the PDM system. This inverter permits zero-voltage switching of all semiconductors which reduces switching losses and switching stresses. The objectives of this project are to develop and validate an analytical model of the MCT device when used in high power motor control applications and to design, fabricate, and test a prototype electronic circuit employing both MCT and PDM technology for controlling a brushless dc motor. HIGH TEMPERATURE CO-AXIAL WINDING TRANSFORMERS Final Interim Report, May 1992 - Feb. 1993
Deepakraj M. Divan and Donald W. Novotny 1993 57 p
(Contract NCC3-261)
(NASA-CR-194580; NAS 1.26:194580) Avail: CASI HC A04/MF A01

The analysis and design of co-axial winding transformers is presented. The design equations are derived and the different design approaches are discussed. One of the most important features of co-axial winding transformers is the fact that the leakage inductance is well controlled and can be made low. This is not the case in conventional winding transformers. In addition, the power density of co-axial winding transformers is higher than conventional ones. Hence, using co-axial winding transformers in a certain converter topology improves the power density of the converter. The design methodology used in meeting the proposed specifications of the co-axial winding transformer specifications are presented and discussed. The final transformer design was constructed in the lab. Co-axial winding transformers proved to be a good choice for high power density and high frequency applications. They have a more predictable performance compared with conventional transformers. In addition, the leakage inductance of the transformer can be controlled easily to suit a specific application. For space applications, one major concern is the extraction of heat from power apparatus to prevent excessive heating and hence damaging of these units. Because of the vacuum environment, the only way to extract heat is by using a cold plate. One advantage of co-axial winding transformers is that the surface area available to extract heat from is very large compared to conventional transformers. This stems from the unique structure of the co-axial transformer where the whole core surface area is exposed and can be utilized for cooling effectively. This is a crucial issue here since most of the losses are core losses. Derived from text

MICROTRIBOLOGY OF MAGNETIC MEDIA
Bharat Bhushan, Vilas N. Koinkar, and Ju-Ai Ruan 1 Oct. 1993 46 p Revised
(Contract N00014-93-I-0067)
(AD-A271209) Avail: CASI HC A03/MF A01

Scanning tunneling microscopy (STM), atomic force microscopy (AFM), and the modification of AFM's (such as friction force microscopy (FFM)) are becoming increasingly important in the understanding of fundamental mechanisms of friction, wear and lubrication and in studying the interfacial phenomena in micro- and nanostructures used in magnetic storage devices and micro-electromechanical systems (MEMS). In the paper, we describe modified AFM and FFM techniques and present data microtribological studies of magnetic media-magnetic tapes and disks. Local variation in microscale friction is found to correspond to the local slope suggesting that ratchet mechanism is responsible for this variation. Wear rates for magnetic tapes are approximately constant for various loads and test duration. However, for the magnetic disks, the wear of the diamondlike carbon overcoat is catastrophic. Evolution of the wear has also been studied using AFM. AFM has been modified for nanoindentation hardness measurements. We have shown that hardness of ultra thin films can be measured using AFM. AFM has also shown to be useful for nanofabrication. DTIC

ELECTRO-OPTICS DISPLAY RESEARCH, TEST, AND EVALUATION LABORATORY PROGRAM Final Report, Sep. 1987 - Jun. 1993
Mohammad A. Karim and Donald L. Moon 29 Jun. 1993 61 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DAAL03-87-K-0121)
(AD-A270947; ARO-25557.10-EL) Avail: CASI HC A04

The goal of the research effort is to analyze and develop a model to characterize overall electro-optical display systems of particular interest to U.S. Army Center for Night Vision and Electro-Optics at Ft. Belvoir, Virginia. The main thrust of the research reported herein is to implement accepted standards for evaluating displays, take an active role in forming new measurement standards, and provide unbiased evaluation of displays in use or contemplated for military missions. Measurement parameters include display brightness, contrast, resolution, chromatic range, frequency response, angular field-of-view, reliability, and sensitivity to environment. Another important facet of this research is to determine image dynamics involving the response time between sensor input and the reaction of the observer for influencing what display improvements, such as variable acuity displays, color, contrast, or brightness lead to significant improvement in performance. TRANSCUTANEOUS ANALYTE MEASURING METHODS (TAMM) Quarterly Progress Report No. 7, Apr. - Sep. 1993
Kenneth J. Schlager 4 Oct. 1993 21 p
(Contract N00014-91-C-0190)
(AD-A271387) Avail: CASI HC A03/MF A01

This document contains a comprehensive status report on the TAMM Phase II SBIR project at Biotronics Technologies. It is important to understand at this stage of TAMM development the strengths and weaknesses of current instrumentation and the design approach to overcoming current shortcomings. Optimism of Biotronics remains high. Even though the low signal-to-noise ratio (SNR) of TAMM I instrumentation (the BI-800 Array Analyzer) made signal processing difficult and limited measurement accuracy, encouraging test results were still achieved, especially on the last 73 patients tested in Milwaukee. TRANSDUCERS AND METHOD FOR MAKING SAME Patent Application
Manfred Kahn, inventor (to Navy) and C. Kim, inventor (to Navy) 9 Jun. 1993 28 p
(AD-D015949; US-Patent-Appl-SN-076135; Navy-Case-74904) Avail: CASI HC A03/MF A01

The invention pertains generally to transducers and more particularly to transducers which convert hydrostatic or acoustic pressure into electrical signals. Elongated electrically nonconducting transducer preforms are made from a stiff resin. The preforms have grooves in their upper and lower surfaces. Transducer elements may be formed from staked preforms whereby grooves in their upper and lower surfaces form compartments between adjoining stacked preforms. PZT rods are disposed in the grooves disposed on the upper surface of each stacked preform, and a soft resin surrounds the rods and fills the compartment. The method for making the transducer assembly includes the steps of loading by gravity the rods into the upper grooves of the preforms; stacking the loaded preforms so that upper grooves in the lower preform communicate with lower grooves in the upper preform, thus forming cavities; flowing a soft resin around the rods; and curing the soft resin. POLARIZED OPTICAL EMISSION DUE TO DECAY OR RECOMBINATION OF SPIN-POLARIZED INJECTED CARRIERS Patent Application
Berend T. Jonker, inventor (to Navy) 29 Jun. 1993 16 p
(AD-D015907; US-Patent-Appl-SN-083231; Navy-Case-74741) Avail: CASI HC A03/MF A01

A device for producing circularly polarized optical emission includes a light emitting semiconductor heterostructure, further including at least one semiconducting layer; a ferromagnetic contact having a magnetic moment, in electrical contact with a layer of the semiconductor heterostructure; and a contact electrically connected to a different region of the semiconductor heterostructure. This light emitting semiconductor heterostructure may be a light emitting diode (LED), or some other structure. The ferromagnetic contact injects spin polarized carriers (electrons or holes) into the semiconducting device, which recombine with their opposing carriers to produce circularly polarized light. A process for producing circularly polarized optical emission includes applying a bias across a light emitting semiconductor heterostructure having a contact with a net magnetic moment, thereby injecting spin polarized carriers into the light emitting semiconductor heterostructure. UNDERSTANDING CURVED DETONATION WAVES

B. G. Bukiet (New Jersey Inst. of Tech., Newark.), K. S. Lackner, and R. Menikoff 1993 9 p Presented at the 10th Detonation Symposium, Boston, MA, 12-16 Jul. 1993
(Contract W-7405-eng-36)
(DE93-014581; LA-UR-93-1723; CONF-930713-15) Avail: CASI HC A02/MF A01

The reaction zone of a detonation wave is very small compared to the dynamic length scale for a typical application. Consequently, it is impractical for numerical calculations to fully resolve the reaction zone. A non-zero reaction zone width is critical to describe curved detonation waves because it affects the wave speed. The curvature effect is the result of an interaction between the rate of energy release and geometric source terms within the reaction zone. When the reaction zone width is determined by the computational cell size rather than the physical scale, the numerics introduces an artificial curvature effect which frequently dominates the physical effect and leads to mesh dependence of simulations. Modified Hugoniot jump conditions are derived which characterize the curvature effect. They express the conservation laws and are not sensitive to the detailed reaction dynamics but instead depend only on the reaction zone width, and averages of pressure and of mass, momentum and energy densities. RECIRCULATION IN FORWARD ROLL COATING

P. J. Wicks and J.-M. Buchlin Dec. 1992 35 p
(VKI-TM-48; ETN-93-94840) Avail: CASI HC A03/MF A01

A prediction for the onset of recirculating flow in symmetric forward roll coating, as the capillary number is decreased, is made using an approximate analytic technique based on a model by Pitts and Greiller. Recirculating flow is predicted to exist when the capillary number is below about 0.62. Streamline patterns and contour plots of the pressure distribution predicted by the model are provided. An explanation for the existence of recirculation at low capillary number is suggested. The structure of the recirculating flow on symmetric and asymmetric forward coating is discussed. It is claimed, on grounds of structural stability, that in the asymmetric case there is a wedge of fluid which starts off near one of the cylinders, but then passes backwards between the two recirculation zones before joining the film attached to the other cylinder. FIN-EFFICIENCY CALCULATION FOR CONDENSATION IN THE PRESENCE OF NONCONDENSABLE GASES

C. B. Panchal 1993 11 p Presented at the Condensation and Condenser Design Conference, St. Augustine, FL, 7-12 Mar. 1993
(Contract W-31-109-eng-38)
(DE93-017684; ANL/ES/CP-80354; CONF-9303200-2) Avail: CASI HC A03/MF A01

Plate-fin heat exchangers are being considered for many condenser applications. They are commonly used for the gas-separation process because they can provide a high thermal performance to obtain a low mean-temperature difference, essential for the gas-separation process. Plate-fin heat exchangers are also considered for the heat-pump system using nonazeotropic refrigerant mixtures. The brazed plate-fin condenser was considered to be a leading candidate for the Ocean Thermal Energy Conversion (OTEC) system, where high-performance heat exchangers are essential for maintaining a low mean-temperature difference. Calculation of the fin efficiency is difficult for condensation in the presence of noncondensable gases due to the spatial variation of the interfacial temperature. An analysis was carried out to develop a simplified method to calculate the fin efficiency for condensation of a vapor in the presence of noncondensable gases. The analysis includes the variation in the interfacial temperature along the fin surface. Appropriate assumptions are made to simplify the coupled heat-conduction equation in the fin and the heat/mass fluxes at the interface. The resulting expression for the fin efficiency includes mass-flux parameters, and it is similar to the common expression used for single-phase flow. DOE

INVESTIGATION OF A MATRIX-MODEL FOR THE ARTIFICIAL DISSIPATION IN A CELL VERTEX FINITE VOLUME SCHEME FOR SOLVING THE NAVIER-STOKES EQUATIONS Thesis - Tech. Univ. Brunswick [UNTERSUCHUNG EINER MATRIX-DISSIPATION IN EINEM ZELLENECKPUNKT-FINITE-VOLUMEN-SCHEMA ZUR LOESUNG DER NAVIER-STOKES-GLEICHUNGEN]

Olaf Brodersen Jun. 1992 100 p In GERMAN
(DLR-FB-92-33; ETN-93-94869) Avail: CASI HC A05/MF A02

A matrix dissipation model is evaluated for the numerical solution of the Navier-Stokes equations. The numerical approach, a finite volume scheme with central differencing, was outlined and the necessity of artificially added dissipation was shown. The design of the dissipation term for modeling an upwind scheme is described for the one dimensional linear wave equation. Following this approach results in time consuming matrix multiplications for two dimensional and three dimensional cases. Because of a new splitting technique of the matrices found in the literature, it is now possible to use this dissipation model in a more efficient way. The basic effects were analyzed for viscous flow around the RAE 2822 airfoil. The results show a higher resolution of shocks and the boundary layer. Thus, it is possible to use coarser meshes so that CPU (Central Processing Unit) time is reduced by about a factor of three. ESA

ON MEMORY EFFECTS IN TURBULENCE Thesis - Goettingen Univ. [UEBER GEDAECHTNISEFFEKTE IN DER TURBULENZ]

Stefan Woppowa Feb. 1993 48 p In GERMAN Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DLR-FB-93-03; ETN-93-94873) Avail: CASI HC A03

A Reynolds stress closure scheme which takes into account memory effects in turbulent shear flows is tested against data for fully developed turbulent rotating channel flow. In the rotating cases the zone where memory effects are essential contains the region of negative turbulence production and overshoots the edge of the latter to the stable side of the channel. In this region the relationship between local Reynolds stress and mean velocity field is not of local nature. The comparison between calculated and experimental mean velocity profiles leads to satisfactory agreement. The field equations for highly accelerated two-dimensional turbulent boundary layers were substantiated by the method of matched asymptotic expansions. ESA

FLUID-STRUCTURE-INTERACTION ANALYSES OF REACTOR VESSEL USING IMPROVED HYBRID LAGRANGIAN EULERIAN CODE ALICE-II

C. Y. Wang 1993 38 p Presented at the Pressure Vessels and Piping Conference, Denver, CO, 25-29 Jul. 1993
(Contract W-31-109-eng-38)
(DE93-015536; ANL/RE/CP-77653; CONF-930702-34) Avail: CASI HC A03/MF A01

This paper describes fluid-structure-interaction and structure response analyses of a reactor vessel subjected to loadings associated with postulated accidents, using the hybrid Lagrangian-Eulerian code ALICE-II. This code has been improved recently to accommodate many features associated with innovative designs of reactor vessels. Calculational capabilities have been developed to treat water in the reactor cavity outside the vessel, internal shield structures and internal thin shells. The objective of the present analyses is to study the cover response and potential for missile generation in response to a fuel-coolant interaction in the core region. Three calculations were performed using the cover weight as a parameter. To study the effect of the cavity water, vessel response calculations for both wet- and dry-cavity designs are compared. Results indicate that for all cases studied and for the design parameters assumed, the calculated cover displacements are all smaller than the bolts' ultimate displacement and no missile generation of the closure head is predicted. Also, solutions reveal that the cavity water of the wet-cavity design plays an important role of restraining the downward displacement of the bottom head. Based on these studies, the analyses predict that the structure integrity is maintained throughout the postulated accident for the wet-cavity design. DOE

ADVANCED IN MACROSTATISTICAL HYDRODYNAMICS
Alan L. Graham, Nicholas Tetlow, James R. Abbott, Lisa A. Mondy (Sandia National Labs., Albuquerque, NM.), and Howard Brenner (Massachusetts Inst. of Tech., Cambridge.) 1993 17 p Presented at the Advances in Structures Heterogenous Continua, Moscow, Russia, 22-27 Aug. 1993
(Contracts W-7405-eng-36; DE-AC04-76DP-00789)
(DE93-018479; LA-UR-93-2612; CONF-9308141-1) Avail: CASI HC A03/MF A01

An overview is presented of research that focuses on slow flows of suspensions in which colloidal and inertial effects are negligibly small (macrostatistical hydrodynamics). First, we describe nuclear magnetic resonance imaging experiments to quantitatively measure particle migration occurring in concentrated suspensions undergoing a flow with a nonuniform shear rate. These experiments address the issue of how the flow field affects the microstructure of suspensions. In order to understand the local viscosity in a suspension with such a flow-induced, spatially varying concentration, one must know how the viscosity of a homogeneous suspension depends on such variables as solids concentration and particle orientation. We suggest the technique of falling ball viscometry, using small balls, as a method to determine the effective viscosity of a suspension without affecting the original microstructure significantly. We also describe data from experiments in which the detailed fluctuations of a falling ball's velocity indicate the noncontinuum nature of the suspension and may lead to more insights into the effects of suspension microstructure on macroscopic properties. Finally, we briefly describe other experiments that can be performed in quiescent suspensions (in contrast to the use of conventional shear rotational viscometers) in order to learn more about the microstructure and boundary effects in concentrated suspensions. WAVE STRUCTURE INDUCED BY FLUID DYNAMIC LIMITS IN THE BROADWELL MODEL Technical Summary Report
Athanasios E. Tzavaras Jul. 1993 44 p Sponored in part by NSF and ONR Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A268512; CMS-TSR-94-2) Avail: CASI HC A03

Consider the fluid dynamic limit problem for the Broadwell system of the kinetic theory of gases, for Riemann, Maxwellian initial data. The formal limit is the Riemann problem for a pair of conservation laws and is invariant under dilations of coordinates. The approach of self-similar fluid dynamic limits consists in replacing the mean free path in the Broadwell model so that the resulting problem preserves the invariance under dilations. The limiting procedure was justified by Slemrod and Tzavaras. Here, we study the structure of the emerging solutions. We show that they consist of two wave fans separated by a constant state. Each wave fan is associated with one of the characteristic fields and is either a rarefaction wave or a shock wave. The shocks satisfy the Lax shock conditions and have the internal structure of a Broadwell shock profile. DTIC

PARABOLIZED NAVIER-STOKES COMPUTATION OF SURFACE HEAT TRANSFER CHARACTERISTICS FOR SUPERSONIC AND HYPERSONIC KE PROJECTILES Final Report, Sep. 1991 - Apr. 1993
Bernard J. Guidos and Paul Weinacht Aug. 1993 52 p See also BRL-IMR-970, Apr. 1992 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A268858; ARL-TR-191; BRL-IMR-970) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Perfect gas heat transfer characteristics are presented for two existing supersonic finned kinetic energy (KE) projectiles (M735 and M829) and for a conceptual hypersonic KE projectile configuration. The hypersonic configuration is obtained by replacing the fins of the M829 with a conical flare of varying sweep angle. A three-dimensional, viscous, parabolized Navier-Stokes (PNS) computational technique is used to compute the perfect gas adiabatic wall temperatures and heat transfer rates in the velocity range 1.3 km/sec to 4 km/sec (Mach number range about 4 to 12). The heat transfer characteristics provide a necessary boundary condition for subsequent heat conduction computations, which simulate the transient in-flight thermal response of projectile configurations. CHEMICAL REACTIONS IN TURBULENT MIXING FLOWS Annual Technical Report, 1 Jun. 1992 - 31 May 1993
Paul E. Dimotakis and Anthony Leonard 15 Jul. 1993 135 p
(Contract F49620-92-J-0290)
(AD-A269377; AFOSR-93-0679TR) Avail: CASI HC A07/MF A02

In the course of this research we have conducted investigations of turbulent mixing, chemical reaction, and combustion processes in turbulent, subsonic, and supersonic flows. The program was comprised of several parts: an experimental effort, a theoretical and numerical simulation effort, and a development of instrumentation and diagnostics; an upgrade of flow and combustion facilities; and the development of data-acquisition sub-systems. We have carried out a series of theoretical and experimental studies of turbulent mixing in two well-defined, fundamentally important flow fields: free-shear layers and axisymmetric jets. To elucidate molecular transport effects, experiments and theory have dealt with both reacting and non-reacting flows of liquids and gases in fully-developed turbulent flows. A criterion for fully-developed turbulence was recently developed. The computational studies are, at present, focused at fundamental formulation and implementation issues pertaining to the simulation of both compressible and incompressible flows characterized by strong fronts, such as shock waves and flames. In our diagnostic development efforts we have improved the signal-to-noise ratio of flow images, in both gas- and liquid-phase flows, as well as continued with the development of data-acquisition electronics to meet very high-speed, high-volume data requirements; the acquisition of single, or pairs, of two-dimensional images in rapid succession; and the acquisition of data from arrays of supersonic flow sensors. WORKSHOP ON COMPUTATIONAL TURBULENCE MODELING
1993 405 p Workshop held in Cleveland, OH, 15-16 Sep. 1993
(NASA-TM-109266; NAS 1.15:109266) Avail: CASI HC A18/MF A04

This document contains presentations given at Workshop on Computational Turbulence Modeling held 15-16 Sep. 1993. The purpose of the meeting was to discuss the current status and future development of turbulence modeling in computational fluid dynamics for aerospace propulsion systems. Papers cover the following topics: turbulence modeling activities at the Center for Modeling of Turbulence and Transition (CMOTT); heat transfer and turbomachinery flow physics; aerothermochemistry and computational methods for space systems; computational fluid dynamics and the k-epsilon turbulence model; propulsion systems; and inlet, duct, and nozzle flow. For individual titles, see N94-18546 through N94-18556.

RESEARCH ACTIVITIES AT THE CENTER FOR MODELING OF TURBULENCE AND TRANSITION
Tsan-Hsing Shih *In its* Workshop on Computational Turbulence Modeling 1993 21 p (For primary document see N94-18545 04-34)
Avail: CASI HC A03/MF A04

The main research activities at the Center for Modeling of Turbulence and Transition (CMOTT) are described. The research objective of CMOTT is to improve and/or develop turbulence and transition models for propulsion systems. The flows of interest in propulsion systems can be both compressible and incompressible, three dimensional, bounded by complex wall geometries, chemically reacting, and involve 'bypass' transition. The most relevant turbulence and transition models for the above flows are one- and two-equation eddy viscosity models, Reynolds stress algebraic- and transport-equation models, pdf models, and multiple-scale models. All these models are classified as one-point closure schemes since only one-point (in time and space) turbulent correlations, such as second moments (Reynolds stresses and turbulent heat fluxes) and third moments, are involved. In computational fluid dynamics, all turbulent quantities are one-point correlations. Therefore, the study of one-point turbulent closure schemes is the focus of our turbulence research. However, other research, such as the renormalization group theory, the direct interaction approximation method, and numerical simulations are also pursued to support the development of turbulence modeling. RESEARCH ON TWO EQUATION MODELS
Z. Yang *In its* Workshop on Computational Turbulence Modeling 1993 10 p (For primary document see N94-18545 04-34)
Avail: CASI HC A02/MF A04

The k-epsilon model is the most widely used turbulence model in engineering calculations. However, the model has several deficiencies that need to be fixed. This document presents improvements to the capabilities of the k-epsilon model in the following areas: a Galilean and tensorial invariant k-epsilon model for near wall turbulence; a new set of wall functions for attached flows; a new model equation for the dissipation rate, which has a better theoretical basis, contains the contribution of flow inhomogeneity, and captures the effect of the pressure gradient accurately; and a better model for bypass transition due to freestream turbulence. Derived from text

ASSESSMENT AND DEVELOPMENT OF SECOND ORDER TURBULENCE MODELS
Aamir Shabbir *In its* Workshop on Computational Turbulence Modeling 1993 14 p (For primary document see N94-18545 04-34)
Avail: CASI HC A03/MF A04

Second order turbulence models describe the effect of mean flow and external agencies (such as buoyancy) on the evolution of turbulence. Therefore, in principle, these models give a more accurate description of complicated flow fields (e.g. flows with large anisotropy in turbulence, such as near the leading edge of a turbine blade) than the two equation models. The objectives of this document are to assess the performance of the various second order turbulence models in benchmark flows and to seek improvements where necessary in models for the pressure correlation term in the scalar flux equation and for the scalar dissipation equation. Derived from text

A COUPLED IMPLICIT SOLUTION METHOD FOR TURBULENT SPRAY COMBUSTION IN PROPULSION SYSTEMS
K.-H. Chen and J.-S. Shuen (Sverdrup Technology, Inc., Cleveland, OH.) *In* NASA. Lewis Research Center, Workshop on Computational Turbulence Modeling 1993 16 p (For primary document see N94-18545 04-34)
Avail: CASI HC A03/MF A04

Many reacting flows in propulsion devices cannot be efficiently calculated by modern compressible flow CFD algorithms. Most low-speed reacting flow codes based on TEACH-type technologies are inefficient and lack robustness for complex flows. Tremendous progress has been made in high-speed compressible flow CFD in the past two decades; extending its application range to low-speed regimes is highly desirable. The objectives of this document is to present an efficient and robust algorithm for multi-phase chemically reacting flows at all speeds, with emphasis on low Mach number flows, and to calculate turbulent spray combustion flow in a gas turbine combustor. Derived from text

ANALYSIS OF SUPERSONIC FLOWS USING k-EPSILON MODEL AND THE RPLUS CODE: PROGRESS TOWARDS HIGH SPEED COMBUSTOR ANALYSIS
J. Lee *In* NASA. Lewis Research Center, Workshop on Computational Turbulence Modeling 1993 11 p (For primary document see N94-18545 04-34)
Avail: CASI HC A03/MF A04

The problem of interest here is the analysis of chemically reacting flow inside of supersonic ramjet combustors. Two key parameters need to be determined: mixing/combustion efficiency and kinetic energy efficiency. In order to determine these parameters, several potential loss mechanisms must be modeled correctly, including mixing, shear, turbulence, vorticity, shock waves, heat transfer, fuel injector drag, poor wall pressure integral, and chemical dissociation. This document discusses k-epsilon turbulence models for use in the RPLUS code for numerical modeling of combustor flow fields. CASI

COMPUTATIONAL FLUID DYNAMICS

1993 587 p Lecture series held in Rhode-Saint-Genese, Belgium, 15-19 Mar. 1993
(VKI-LS-1993-04; ETN-93-94445) Copyright Avail: CASI HC A25/MF A06

The aim was to provide in-depth presentations on well established methods and on recent advances in the field of numerical flow simulation. The space discretizations studied were finite volume, finite element, and spectral methods. Applications were covered in the fields of incompressible flow and aerodynamics. The theory of hyperbolic conservation laws is given, including a comparison of the currently used high resolution Total Variation Diminishing (TVD) finite volume schemes. The finite volume line was elaborated in separate lectures on Essentially Non Oscillatory (ENO) schemes including application to unstructured grids. Alternative discretizations which received equal attention were variational methods such as the finite element method, and spectral methods. Next to the basic discretizations, attention was given to the time integration methods for unsteady flows and to the iterative solution methods for steady state computations. For individual titles, see N94-18558 through N94-18568.

HIGH ORDER NON-OSCILLATORY SCHEMES FOR THE COMPRESSIBLE EULER EQUATIONS

Richard Sanders *In* VKI, Computational Fluid Dynamics 1993 31 p (For primary document see N94-18557 04-34)
Copyright Avail: CASI HC A03/MF A06

Some of the basic ideas used today to numerically simulate high speed compressible fluid flow are reviewed. Some of the mathematical facts that are known about first order hyperbolic partial differential equations are listed. Remarks and examples are given to highlight questions concerning existence, uniqueness, and stability of solutions to the scalar equation. Differences between the scalar equation and the system of equations, as well as gaps in the mathematical theory are discussed. The Riemann problem, approximate Riemann problem solvers, and numerical flux functions that can be derived from approximate Riemann problem solvers are discussed. The first order Godunov method is developed and modified to include a number of higher order extensions. One dimensional variation stability is discussed for the scalar version of these extensions. A notion of accuracy that differs from the usual notion of pointwise accuracy is included. The finite volume method and a weakness of its quasi one dimensional version are considered. A two dimensional supersonic nozzle is numerically simulated. ESA

A MULTIGRID ACCELERATION TECHNIQUE FOR COMPUTING STEADY SOLUTIONS TO THE EQUATIONS OF COMPRESSIBLE FLOW

Richard Sanders *In* VKI, Computational Fluid Dynamics 1993 22 p (For primary document see N94-18557 04-34)
Copyright Avail: CASI HC A03/MF A06

The role that multigrid techniques play in solving the challenging problem of finding steady state solutions to the compressible Euler equations is discussed. The multigrid approach is a powerful tool for rapidly computing solutions to large linear and nonlinear systems of equations. Most notably is its application to finding solutions of elliptic boundary value problems. The rate of convergence offered by conventional iterative techniques is illustrated by solving a finite difference scheme. A two dimensional scalar model problem is discussed. ESA

Algorithms for solving the Euler and the Navier-Stokes equations in conjunction with chemical kinetic equations are presented. The convective flux is estimated from a quasi one dimensional interpolation procedure. Shock, contact, and expansion waves and thermochemical nonequilibrium phenomena are captured by the Lax-Friedrichs technique. Relaxation techniques were developed to enhance their effectiveness in dealing with spatial and temporal stiffness associated with the physical problems. Both explicit and implicit smoothers were implemented into the standard multigrid time stepping method. Unsteady and steady scalar problems are discussed. A perfect gas and equilibrium air shock tube problem is investigated. Numerical schemes and techniques are compared for the problems of shock and boundary layer interaction and three dimensional viscous, nonequilibrium flow encompassing an aerobrake. The results are comparable in accuracy against other high order non-oscillatory techniques. The multigrid methods are assessed using a Mach 8 flow over a complete planar body, a sphere, and a blunt delta wing at 20 deg incidence. Applying an implicit multigrid method on a nested grid of 128 by 64 nodes the reduction factor is 0.25. The central processing unit reduction factor is 2.2 after both the single and multigrid Runge-Kutta solutions converged to machine zero on a grid of 37 by 41 by 73 nodes. ESA

ENO SCHEMES ON UNSTRUCTURED MESHES

R. Abgrall and F. C. Lafon (Commissariat a l'Energie Atomique, Villeneuve-Saint-Georges, France.) *In* VKI, Computational Fluid Dynamics 1993 60 p (For primary document see N94-18557 04-34)
Copyright Avail: CASI HC A04/MF A06

The class of the Essentially Non Oscillatory (ENO) schemes is presented. The purpose is to provide a description of the basic ideas of ENO methods and to show how it is possible to adapt them on general geometries. The basic idea of ENO schemes is to use a Lagrange type interpolation with an adapted stencil: when a discontinuity is detected, the procedure looks for the region around this discontinuity where the function is the smoothest. The principle of finite volume schemes is reviewed. The reconstruction step, the evolution step, and the projection step are shown. Before the reconstruction step, several Runge-Kutta methods are given. The 'classical' methods that are applied to real valued functions are presented. Some pathologies of ENO reconstruction procedures and how to cure the problems are discussed. ESA

MULTIDIMENSIONAL WAVE DECOMPOSITIONS FOR THE EULER EQUATIONS

Michael A. Rudgyard *In* VKI, Computational Fluid Dynamics 1993 29 p (For primary document see N94-18557 04-34)

Copyright Avail: CASI HC A03/MF A06

The aim is to present an overview of wave modeling and its application to the two dimensional Euler equations. Both new and existing models are discussed. Some basic issues relating to the use of multidimensional upwinding applied to the Euler equations are summarized. This includes a description of a positive nonlinear advection scheme using a cell vertex, or 'fluctuation splitting.' A conservative linearization for Euler equations is presented. Concerning wave modeling, directional splitting approach, fine wave model, Roe's model, Parpia's five wave model, and flow wave models are summarized. The models of multidimensional upwinding give solutions that rival the accuracy of classical total variation diminishing schemes applied to simple test problems. The techniques are still in their infancy and are not yet robust enough to be used in an industrial environment. Nonetheless, the initial evidence is promising enough for us to continue research in this area. ESA

COMPACT ADVECTION SCHEMES ON UNSTRUCTURED GRIDS

H. Deconinck, Robert Struijs, G. Bourgois, and Philip L. Roe (Michigan Univ., Ann Arbor.) *In its* Computational Fluid Dynamics 1993 81 p (For primary document see N94-18557 04-34)

Copyright Avail: CASI HC A05/MF A06

The status of compact cell vertex advection schemes for scalar conservation laws, discretized on unstructured grids composed of triangles of tetrahedra is described. The concepts of fluctuation splitting schemes in one, two, and three dimensions are discussed. Attention is given to a careful definition of upwind concepts in three dimensions and to design criteria to be satisfied by the advection schemes. It is shown that linearity preservation and positivity are incompatible for linear schemes generalizing well known results on structured grids. Two classes of linear schemes, one satisfying positivity at the price of first order accuracy and one satisfying linearity preservation with the price of spurious oscillations near discontinuities, are discussed. Nonlinear schemes which do satisfy positivity and linearity preservation are described. These schemes are compared with least squares Galerkin finite element schemes. A numerical accuracy study of the different schemes is added. A study of the shock capturing properties for the monotone higher order schemes is given. The performance of the different schemes is compared for different testcases among which scalar advection of a discontinuity and a nonlinear conservation law with shock. ESA

VARIATIONAL APPROACHES TO CFD: APPLICATIONS TO POTENTIAL EULER AND NAVIER-STOKES EQUATIONS

M. Hafez *In* VKI, Computational Fluid Dynamics 1993 152 p Sponsored by NASA. Ames Research Center (For primary document see N94-18557 04-34)

Copyright Avail: CASI HC A08/MF A06

Flow simulations based on variational techniques are discussed. Variational techniques are applied for the problem formulation, for the construction of discrete schemes, and for the solution procedures. Inviscid transonic flows, as well as viscous incompressible and compressible flows, are analyzed by several methods. Variational techniques to solve the discrete systems of equations are well known. The most popular one is the conjugate gradient method. Extensions to nonsymmetric and nonpositive definite systems were under investigation for the last two decades. Variational techniques were used for convergence acceleration of iterative procedures. Some of these ideas based on recent work are examined. The lectures are organized in three parts including numerical simulation of inviscid as well as viscous incompressible and compressible flows. ESA

INTRODUCTION TO SPECTRAL METHODS: APPLICATION TO THE STOKES PROBLEM

Y. Maday *In* VKI, Computational Fluid Dynamics 1993 26 p (For primary document see N94-18557 04-34)

Copyright Avail: CASI HC A03/MF A06

Basic features of spectral methods, their numerical analysis, the spectral element method in curved geometries, the Stokes problem, and an extension to more complex situations such as nonhomogenous Dirichlet and Neumann boundary conditions are introduced. Spectral methods are used to approximate the solution of partial differential equations. The discrete functions are polynomials, the degree of which, denoted N, is the discretization parameter so that the convergence is achieved by letting N go to infinity. The general strategy involves a weighted residual technique or a collocation technique in order to define the discrete solution. Spectral methods are used when the domain where the solution is defined is a square or a rectangle in two dimensions, or when it is a cube or a rectangle parallelogram in three dimensions. In the case where the domain is more complex, a domain decomposition is required to use spectral type methods. Spectral element methods combine the rapid convergence rate of the plain spectral methods with the generality of finite element techniques. By construction, the spectral element methods are applicable to many complex geometries and also to many equations. ESA

N94-18567# Paris VI Univ. (France).

INTRODUCTION TO SPECTRAL METHODS FOR HYPERBOLIC SYSTEM OF CONSERVATION LAWS

Y. Maday *In* VKI, Computational Fluid Dynamics 1993 12 p (For primary document see N94-18557 04-34)

Copyright Avail: CASI HC A03/MF A06

Spectral type approximations follow the same global rule and the approximation of discontinuous functions by these methods is only very slowly convergent and, apparently, not better than the finite order methods. Actually there are global oscillations everywhere on the domain of computation even if the solution is discontinuous at one point and regular everywhere else. A method to compute accurately the first Legendre coefficients of the discontinuous solution of some hyperbolic conservation law is presented. Particular attention is given to spectral viscosity approximation. Theoretical and numerical results are provided. ESA

DISTRIBUTED MEMORY PARALLEL COMPUTERS AND COMPUTATIONAL FLUID DYNAMICS

D. Roose and R. VanDriessche *In* VKI, Computational Fluid Dynamics 1993 44 p (For primary document see N94-18557 04-34)

Copyright Avail: CASI HC A03/MF A06

A tutorial on aspects of parallel computing that are important for the development of efficient parallel algorithms and software for Computational Fluid Dynamics (CFD) is presented. Some important concepts concerning distributed memory parallel computers and parallel algorithms and the parallelization of CFD algorithms on structured grids are given. Many techniques used in CFD are shown to be suited for parallelization. The minimization of work load imbalance and communication and the expectation of a general high speedup and parallel efficiency are outlined. Some methods for partitioning and mapping unstructured grids are described. These methods range from simple heuristics to global optimization methods. Methods that show a good tradeoff between execution time and quality of the result, such as inertial recursive bisection and eigenvector recursive bisection, are considered. ESA

INTRODUCTION TO THE MODELING OF TURBULENCE

1993 518 p Lecture series held in Rhode-Saint-Genese, Belgium, 8-11 Feb. 1993
(VKI-LS-1993-02; ETN-93-94447) Copyright Avail: CASI HC A22/MF A04

The purpose is to provide an introduction to the fundamental physical principles of turbulence and of its modeling and to make a survey of the models currently available and of their domain of application. Emphasis is given to those models which can be considered ready for application to a range of problems of practical interest and to recent advances in second moment closures. Fields of advanced turbulence modeling such as large eddy simulation and compressible flow turbulence are discussed. For individual titles, see N94-18579 through N94-18597.

AN INTRODUCTION TO THE MODELLING OF TURBULENCE

B. E. Launder *In* VKI, Introduction to the Modeling of Turbulence 1993 16 p (For primary document see N94-18578 04-34)
Copyright Avail: CASI HC A03/MF A04

Turbulent flow models are reviewed. A turbulent flow can be obtained under the following conditions: at moderate Reynolds numbers the restraining effects of viscosity are too weak to prevent small, random disturbances in a shear flow from amplifying; the disturbances grow, become nonlinear and interact with neighboring disturbances; this mutual interaction leads to a tangling of vorticity filaments; the flow reaches a chaotic, nonrepeating form describable only in statistical terms. Direct numerical simulations of turbulent shear flows, based on time dependent Navier-Stokes equations, are discussed. Mathematical and physical statements on forming turbulent transport equations are summarized. Velocity distribution and heat and mass transports in turbulent flows are overviewed. ESA

N94-18580# Manchester Univ. (England).

AN INTRODUCTION TO SECOND MOMENT CLOSURE

B. E. Launder *In* VKI, Introduction to the Modeling of Turbulence 1993 13 p (For primary document see N94-18578 04-34)
Copyright Avail: CASI HC A03/MF A04

Second moment closures of either differential or algebraic type equations to describe two dimensional, thin shear flows are introduced. They give more accurate solutions than eddy-viscosity scheme equations. The Reynolds stress transport and the scalar flux equations are obtained. Pressure fluctuations in shear turbulence are discussed. The physical characteristics of phi(sub ij) products, that promote an evolution of turbulence towards isotropy, are listed. The return to isotropy models and the problem of coordinate rotation are considered. The formulations of wall effects and the gradient diffusion hypothesis are summarized. The weakness of the algebraic second moment model is stressed. The analysis shows that differential second moment closures are needed to describe swirling flows and that the epsilon-equation and phi(sub ij) models need extensive testing before being incorporated into general purpose software. ESA

MODELLING FORCE-FIELD EFFECTS ON TURBULENCE

B. E. Launder *In* VKI, Introduction to the Modeling of Turbulence 1993 11 p (For primary document see N94-18578 04-34)
Copyright Avail: CASI HC A03/MF A04

The effects involving fluctuating force fields in the instantaneous momentum equations, which give rise to source or sink terms in the stress and heat flux equations, are investigated. In particular, the following effects are discussed: direct and indirect effects of body forces in second moment equations; buoyancy effects on the epsilon equation and on stress transport; and secondary generation effects in plumes. The analysis shows that when force fields modify turbulence structure directly, second moment closure is needed to capture effects. Moreover, in highly stable flows it may be important to include buoyant effects on triple moments. The basic model developed for shear flows without force fields extrapolates well to buoyant and swirling flows. However, if buoyant and shear generation of k are equally effective in modifying epsilon, c(sub epsilon 1) needs to be reduced. ESA

N94-18582# Manchester Univ. (England).

A NEW FORM OF SECOND-MOMENT CLOSURE

B. E. Launder *In* VKI, Introduction to the Modeling of Turbulence 1993 16 p (For primary document see N94-18578 04-34)
Copyright Avail: CASI HC A03/MF A04

The purpose of this study is: to introduce the stress invariants and their characteristics; to discuss the models of pressure interactions for phi(sub ij) and phi(sub i phi); to consider new forms of the dissipation rate equations; and to compare the model's performance in a selection of flows with simpler formulations. The study is motivated by the fact that: the basic model does rather poorly in free shear flows; wrong dependence of effective turbulent Prandtl number on strain rate; and that thermal dynamic time scale ratio is not constant. Direct data simulation suggests that even when the right effect is achieved it may be for the wrong reasons. ESA

N94-18583# Manchester Univ. (England).

AN INTRODUCTION TO SINGLE-POINT CLOSURE METHODOLOGY

B. E. Launder *In* VKI, Introduction to the Modeling of Turbulence 1993 90 p (For primary document see N94-18578 04-34)
Copyright Avail: CASI HC A05/MF A04

Several principles of mathematical physics leading to turbulence modeling approaches are reviewed. The purpose is to simulate processes not exactly determinable at second moment level in terms of mean turbulence properties. The Reynolds number hypothesis, the dissipative correlations, and nondispersive pressure interactions are overviewed. The strategy to take into account mean strain contributions and the effect of force fields is presented. The importance of near wall flow pressure reflections on the pressure-strain correlation is underlined and low Reynolds number turbulence near walls is discussed. The Eddy viscosity models are discussed. ESA

N94-18584# Manchester Univ. (England).

SECOND-MOMENT CLOSURE: PRESENT... AND FUTURE? Abstract Only

B. E. Launder *In* VKI, Introduction to the Modeling of Turbulence 1993 2 p Repr. from Int. J. Heat and Fluid Flow, v. 10, no. 4, Dec. 1989 p 282 (For primary document see N94-18578 04-34)
Copyright Avail: CASI HC A01/MF A04

The present position of second moment closure and the possible directions for future development are discussed. It is argued that a simple form of second moment treatment, widely used for computing industrial flows, gives demonstrably superior predictive accuracy than any eddy viscosity model. Schemes now in the final phases of development, that exactly satisfy various limiting constraints, are presented. The introduction of a further second rank tensor into the closure is considered. The split spectrum approach may be attractive for certain flows with unusual spectral distributions of energy. The introduction of a second scale related equation is arguably a more sensible approach since the extra computational cost is small while the added flexibility could bring significant benefits in modeling turbulence far from equilibrium. TWO-EQUATION MODELS FOR HIGH-REYNOLDS-NUMBER FLOW

M. A. Leschziner and B. E. Launder *In* VKI, Introduction to the Modeling of Turbulence 1993 16 p (For primary document see N94-18578 04-34)

Copyright Avail: CASI HC A03/MF A04

The advantages and disadvantages of one equation model are reviewed. The k-epsilon turbulence model is introduced. Two equation models allow much wider range of turbulent flows to be predicted than one equation variants. The k-epsilon turbulence model is the most popular two equation model: it forms a good compromise between generality and economy of use for many engineering problems. Often complex engineering flows can be modeled to acceptable accuracy with such schemes. The k approximately equal to epsilon model has a number of weaknesses related to curvature, adverse pressure gradient, and flow geometry. Corrections proposed are not generally applicable.
ESA

N94-18587# Manchester Univ. (England).

TWO-EQUATION MODELS FOR LOW-REYNOLDS-NUMBER VARIANTS

M. A. Leschziner and B. E. Launder *In* VKI, Introduction to the Modeling of Turbulence 1993 13 p (For primary document see N94-18578 04-34)

Copyright Avail: CASI HC A03/MF A04

A low Reynolds flow or flow region is one in which the large scale turbulent motion is affected by fluid viscosity. Some of the essential physics of turbulent flow are applied to the near wall sublayer flow. Representative forms of low Reynolds number two equation models are presented. Applications of the models to strongly nonequilibrium flows are shown. Weaknesses and approaches to their cure are indicated. The study shows that: the best models of this type are successful in predicting laminarization and related phenomena; the effects of curvature can only be roughly accounted for by the usual epsilon correction. Only the k-epsilon model was tested in separated flows; the Yap correction is useful but not fully satisfactory; direct simulation data would be helpful in refining the epsilon equation.
ESA

INCLUSION OF SECOND-MOMENT CLOSURES INTO FINITE-VOLUME SOLVERS

M. A. Leschziner *In* VKI, Introduction to the Modeling of Turbulence 1993 11 p (For primary document see N94-18578 04-34)

Copyright Avail: CASI HC A03/MF A04

Second moment closure equations are summarized. The main steps in finite volume discretization are indicated and destabilizing mechanisms are identified. The commonly used algorithmic techniques are outlined. The numerical stability for algebraic and differential closure forms are enhanced. Near wall treatment of second moment equations are described. The study shows that in order to use second moment closure for complex flows, special stabilization practices are needed. These include the use of apparent viscosity terms and careful distinction between negative and positive source terms to improve diagonal dominance. Further measures such as different types of underrelaxation techniques are needed, particularly in strongly swirling flow.
ESA

N94-18589# Manchester Univ. (England).

NUMERICAL IMPLEMENTATION AND PERFORMANCE OF REYNOLDS-STRESS CLOSURES IN FINITE-VOLUME COMPUTATIONS OF RECIRCULATING AND STRONGLY SWIRLING FLOWS

M. A. Leschziner *In* VKI, Introduction to the Modeling of Turbulence 1993 69 p Sponsored in part by United Kingdom Science and Engineering Research Council; Rolls Royce Ltd.; Ministry of Defence, London, England; British Aerospace; and Nielson Engineering and Research, Inc. (For primary document see N94-18578 04-34)

Copyright Avail: CASI HC A04/MF A04

Recent progress made in computing complex recirculating and strongly swirling flows with Reynolds stress closures and nondiffusive discretization within the finite volume framework are outlined. The results reported illustrate that stress closures provide a superior representation of turbulent transport processes to that returned by the Boussinesq viscosity model. This applies both to mean flow and turbulence features. In the case of plane flows, stress closures are especially appropriate and beneficial when the flow is dominated by a recirculation zone 'driven' by a shear layer in which curvature attenuates turbulent transport, especially if this shear layer is adjacent to a wall. In swirling flows, the algebraic representation of stress transport is deficient and must be avoided.
ESA

N94-18590# Manchester Univ. (England).

APPLICATION OF SECOND-MOMENT CLOSURE IN COMPLEX FLOWS

M. A. Leschziner *In* VKI, Introduction to the Modeling of Turbulence 1993 26 p (For primary document see N94-18578 04-34)

Copyright Avail: CASI HC A03/MF A04

Application examples of differential and algebraic second moment closure equations are given. Comments on boundary conditions at fluid inlet and outlet, and walls and symmetry lines are included. The results show that stress models do not perform consistently well, but are virtually always superior to eddy viscosity models, particularly in flows with large recirculation regions and most strongly swirling flows. These advantages appear to extend to three dimensional and transonic flows. The sources of defects are often difficult to identify. Stress transport is influential in axisymmetric flows, particularly with swirl. Only stress models are capable of capturing the main features of strongly swirling confined flows which become 'subcritical' due to severe curvature induced reduction in mixing.
ESA

N94-18591# Manchester Univ. (England).

MODELLING ENGINEERING FLOWS WITH REYNOLDS STRESS TURBULENCE CLOSURE Abstract Only

M. A. Leschziner *In* VKI, Introduction to the Modeling of Turbulence 1993 2 p Repr. from J. of Wind Engineering and Industrial Aerodynamics, v. 35, 1990 p 21-47 (For primary document see N94-18578 04-34)

Copyright Avail: CASI HC A01/MF A04

A Reynolds stress model consists of differential or algebraic equations each governing the balance between generation, dissipation, redistribution, and transport of a related Reynolds stress. The second moment closure combines the above stress equations with additional transport equations for heat or scalar fluxes. The potential advantages of using such closures in preference to eddy viscosity models in the presence of recirculation, swirl, and buoyancy are considered. Some basic forms of Reynolds stress closure are introduced, and their numerical implementation is outlined. Results of computations of complex flow types are presented. Improvements appear to be rooted in the ability of the closures to mimic the strong response of the turbulence structure to streamline curvature.
ESA

N94-18592# Manchester Univ. (England).

TURBULENCE MODELLING CHALLENGES POSED BY COMPLEX FLOWS Abstract Only

M. A. Leschziner *In* VKI, Introduction to the Modeling of Turbulence 1993 2 p Presented also at ROOMVENT, Lyngby, Denmark, Sep. 1992 (For primary document see N94-18578 04-34)

Copyright Avail: CASI HC A01/MF A04

Influential issues pertaining to the computational modeling of multidimensional, separated, turbulent flow are discussed. The modeling implications of a range of distinct physical flow characteristics are considered. Issues addressed include the interaction between turbulence, streamline curvature, buoyancy and normal strain, and the relevance of adverse pressure gradient, acceleration, separation and three dimensionality. Attention is focused on modern approaches to turbulence modeling, based on second moment closure and including adaptations to low Reynolds number regions. Established model variants are introduced, recent developments are reviewed and application examples included.

LARGE-EDDY SIMULATION OF TURBULENT DIFFUSION IN STABLY STRATIFIED SHEAR FLOW Abstract Only
H.-J. Kaltenbach, U. Schumann, and T. Gerz *In* VKI, Introduction to the Modeling of Turbulence 1993 2 p Submitted for publication (For primary document see N94-18578 04-34)
Copyright Avail: CASI HC A01/MF A04

By means of large eddy simulation, homogeneous turbulence is simulated for neutrally and stably stratified shear flow at gradient Richardson numbers between zero and one. The turbulent transport of three passive species which have uniform gradients in either vertical, downstream, or cross stream direction are investigated. The results are compared with previous measurements. The computed and measured flow properties agree with each other generally within the scatter of the measurements. At strong stratification, the Froude number becomes the relevant flow controlling parameter. Stable stratification suppresses vertical overturning mixing when the inverse Froude number exceeds a critical value. The turbulent diffusivity tensor is anisotropic and asymmetric. However, only the vertical and the cross stream diagonal component are of practical importance in shear flows. The vertical diffusion coefficient is much smaller than the cross stream one in strong stratification. This anisotropy is stronger than predicted by previous second order closure models. Downstream and cross stream diffusion follows classical mixing length models. ESA

NUMERICAL SIMULATION OF TURBULENT CONVECTIVE FLOW OVER WAVY TERRAIN
A. Doernbrack and U. Schumann *In* VKI, Introduction to the Modeling of Turbulence 1993 44 p Submitted for publication (For primary document see N94-18578 04-34)
Copyright Avail: CASI HC A03/MF A04

By means of large eddy simulation the convective boundary layer is investigated for flows over wavy terrain. The lower surface height varies sinusoidally in the downstream direction while remaining constant in the other. Several cases are considered with amplitude delta up to 0.15 H and wavelength lambda of H to 8 H, where H is the mean fluid layer height. At the lower surface the vertical heat flux is prescribed to be constant and the momentum flux is determined locally from the Monin-Obukhov relationship with a roughness length z(sub 0) = 0.0001 H. The mean wind is varied in between zero and 5 w, where w is the convective velocity scale. Weak mean wind destroys regular spatial structures induced by the surface undulation at zero mean wind. The surface heating suppresses mean flow recirculation regions even for steep surface waves. Short surface waves cause strong drag due to hydrostatic and dynamic pressure forces in addition to frictional drag. The pressure drag increases slowly with the mean velocity, and strongly with delta/H. The turbulence variances increase mainly in the lower half of the mixed layer for U/w greater than 2. ESA

CALCULATION OF TURBULENT BOUNDARY LAYER WALL PRESSURE SPECTRA
D. E. Capone and G. C. Lauchle Aug. 1993 78 p
(AD-A269549; PSU/ARL-TR-93-10) Avail: CASI HC A05/MF A01

This study is an investigation into the suitability of various wavevector-frequency models of turbulent boundary layer wall pressure fluctuations for the prediction of experimental measurements of turbulent boundary layer wall pressure spectra. Three separate models of the wavevector-frequency spectrum proposed by D. M. Chase in 1980 and 1987 are evaluated. The wavevector-frequency spectral models are integrated numerically using a formulation for the point wall pressure spectrum (based on the work of Uberoi and Kovasznay). The representation of the wall pressure spectrum used accounts for the effect of a finite sized transducer on the measured wall pressure spectrum. By accounting for the area averaging effect of finite sized transducers on the measured turbulent boundary layer wall pressure spectra, it was possible to use Chase's rigorous formulations for the wavevector-frequency spectrum instead of the point pressure spectrum representations which assume an infinitely small measurement sensor. Results from the numerical integrations are compared to recent experimental data to determine which model of the wavevector-frequency spectrum most accurately predicts measured turbulent boundary layer wall pressure spectra. Data from experiments using fluids with a wide range of physical properties (air, water, and glycerine) are used for comparison purposes. Using the selected model, new empirical constants are established for use in the model for each fluid under consideration. Justification for use of the new empirical constants is given, and current limitations of the wavevector-frequency models are discussed. DTIC

(AD-A269945; SAIC-93/1152; AFOSR-93-0702TR) Avail: CASI HC A99/MF A06

The primary objective of SAIC was to develop an unstructured grid algorithm and code that dynamically adapts to the computed solution of the time dependent Euler equations of gasdynamics in two and three spatial dimensions. Important requirements that were imposed on the algorithm were: robustness, accuracy, efficiency, flexibility, and adaptability. The main research and code development effort was focused on achieving these objectives; extensive testing and code validation effort was undertaken to demonstrate the code's performance for realistic CFD problems. The method is accurate in all flow regimes from subsonic to hypersonic. The main achievement was the development of the AUGUST code (adaptive unstructured grid upwind second order for triangles). AUGUST is implemented for solution of Euler's equations on dynamically adaptive triangular or tetrahedral grids. The code fully implements the second-order Godunov method, allowing accurate and robust numerical solution of Euler equations of gas dynamics. A new method was developed for direct dynamic grid refinement (DDR). The AUGUST code was also implemented for multiphase, multicomponent flows. A combined structured/unstructured version of the AUGUST code was also developed. The AUGUST code was extensively validated for a wide range of problems and has proven to be a robust tool. DTIC

STREMR: NUMERICAL MODEL FOR DEPTH-AVERAGED INCOMPRESSIBLE FLOW Final Report
Bernard Roberts Sep. 1993 183 p
(AD-A269949; WES/TR/HL-REMR-HY-11) Avail: CASI HC A09/MF A02

The STREMR computer code is a two-dimensional model for depth-averaged incompressible flow. It accommodates irregular boundaries and nonuniform bathymetry, and it includes empirical corrections for turbulence and secondary flow. Although STREMR uses a rigid-lid surface approximation, the resulting pressure is equivalent to the displacement of a free surface. Thus, the code can be used to model free-surface flow wherever the local Froude number is 0.5 or less. STREMR uses a finite-volume scheme to discretize and solve the governing equations for primary flow, secondary flow, and turbulence energy and dissipation rate. The turbulence equations are taken from the standard k-Epsilon turbulence model, and the equation for secondary flow is developed herein. Appendices to this report summarize the principal equations, as well as the procedures used for their discrete solution. DTIC

COMPUTATIONAL FLUID DYNAMICS (CFD) RESEARCH BRANCH TECHNICAL BRIEFS Final Report, May 1992 - 1993
Don W. Kinsey 9 Jun. 1993 31 p
(AF Proj. 2404)
(AD-A269698; WL-TR-93-3047) Avail: CASI HC A03/MF A01

This report consists of brief technical descriptions and one or more pictures of charts depicting research conducted in-house during the past year. The briefs are designed to provide enough information to clearly define the task, but are short enough to hold the reader's interest. Where applicable, a reference for more detailed information is provided. The research covers a wide spectrum of work; from grid generation to flow solvers, to post-processors; and from incompressible to hypersonic speeds. DTIC

A FINITE ELEMENT SCHEME FOR SHOCK CAPTURING Final Report
R. C. Berger Aug. 1993 63 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A270182; WES/TR/HL-93-12) Avail: CASI HC A04

The representation of hydraulic jumps or shocks in compressible fluids is a difficult task for numerical models. These models require more smoothness than the analytic solution contains. For this reason, these models are plagued with oscillations. The most widespread method is to smear the solution in the vicinity of the shock, giving up 0(1) errors, but restricting the error to the neighborhood of the jump or shock. This technique is called shock-capturing. In this report, a method to capture hydraulic jumps formed by the shallow-water equations in a finite element model is demonstrated. The model itself is two-dimensional. The method it relies upon is a Petrov-Galerkin approach in which the degree of upstream bias in the test function is based upon the characteristics of the convection matrix. Furthermore, in order to restrict the shock capturing to the vicinity of the jump, a method of jump detection is implemented which depends on the variation of mechanical energy within an element. The veracity of the model is tested by comparison of the predicted jump speed and magnitude with analytic and flume results. A comparison is also made to a flume case of steady-state supercritical lateral transition. DTIC

CENTRIFUGE MODELING OF EXPLOSION-INDUCED CRATERS IN UNSATURATED SAND Final Report, May - Aug. 1991
K. C. Brownell and W. A. Charlie Nov. 1992 236 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F08635-90-C-0306)
(AD-A270194; AFCESA/ESL-TR-92-46) Avail: CASI HC A11

Craters, induced by explosive detonations, were modeled in dry and partially saturated sand in a geotechnical centrifuge. The apparent dimensions of the explosion-induced craters are analyzed as dimensional terms and dimensionless pi terms. Analysis of dimensional terms through a comparison of yield exponents shows that the scaling laws for apparent crater dimensions are the same for dry and partially saturated sand. Analysis of the dimensionless pi terms derived by Schmidt and Holsapple for buried charges, shows apparent crater volume (pi sub 1 = Pi exp v) and depth (Pi sub 1 = Pi sub d) do not follow the same scaling laws in partially saturated sand. Normalized (divided by the cube root of the charge mass) apparent crater diameter and depth data fit the best-fit prediction curves for sand derived by the U.S. Army Engineer Waterways Experiment Station. However, the apparent crater diameter data do not fall within the range from dry to wet sand predicted by the Air Force Protective Construction Design Manual. Scaled apparent crater dimensions of crater volume, radius, and depth increase at a point between 0 and 20 percent compaction saturation. Between 20 to 70 percent, the influence of compaction saturation on apparent crater dimensions appears to remain constant. DTIC

CORRELATION OF INCOMING BOUNDARY LAYER PITOT PRESSURE FLUCTUATIONS WITH THE UNSTEADINESS OF FIN-INDUCED SHOCK WAVE TURBULENT BOUNDARY LAYER INTERACTIONS M.S. Thesis
Scott R. Nowlin Dec. 1993 155 p
(AD-A270059; AFIT/CI/CIA-93-143) Avail: CASI HC A08/MF A02

This study focuses on the effects of boundary layer pitot pressure fluctuations on fin-induced separation shock unsteadiness. Experiments performed in two phases under adiabatic wall conditions in a Mach 5 wind tunnel used high frequency-response transducers to measure fluctuating pressures in a turbulent boundary layer and a separated flow induced by a hemi-cylindrical unswept fin. Phase 1 results indicate that the turbulent boundary layer/freestream interface pitot pressure fluctuation frequency levels do not correlate with the sharp fin-induced shock wave turbulent boundary layer interaction aperiodic separation shock motion frequencies. In Phase 2, correlations between fluctuations in incoming boundary layer pitot pressures, intermittent region wall pressures, separation shock dynamics, and fin leading edge pressures show contributions from fluctuations at both low frequencies (approximately 500 Hz)--their source is not well understood--and high frequencies, driven by incoming turbulence. DEVELOPMENT OF A CRYOGENIC HEAT PIPE
F. C. Prenger, W. F. Stewart, and J. E. Runyan 1993 11 p Presented at the International Cryogenic Engineering Conference and International Cryogenic Materials Conference, Albuquerque, NM, 12-16 Jul. 1993
(Contract W-7405-eng-36)
(DE93-018448; LA-UR-93-2515; CONF-930703-13) Avail: CASI HC A03/MF A01

Heat pipe operating characteristics can be used to advantage in cryogenic systems. Diode operation of the heat pipe, the ability to conduct heat in one direction only, is useful in protecting the heat load if the heat sink temperature rises above the load temperature. Because of this, the heat pipe can be made to act as a thermal switch. A screened-wick, inverted-artery, cryogenic heat pipe was designed, fabricated, and tested. The tests were first conducted with hydrogen and then with oxygen as the working fluid. Heat pipe performance limits were measured as a function of operating temperature, and startup from both the supercritical and the frozen state was demonstrated. The heat pipe was designed to operate as a thermal diode, and transient tests were used to determine the turndown ratio. The heat pipe test results were correlated with the Los Alamos heat pipe computer code and good agreement was obtained between the predicted and measured performance. The heat pipe was developed for spacecraft sensor cooling applications. Test results show significant performance advantages over solid conductors. DOE

MULTIGRID METHODS FOR FLOW TRANSITION IN THREE-DIMENSIONAL BOUNDARY LAYERS WITH SURFACE ROUGHNESS Final Report
Chaoqun Liu, Zhining Liu, and Steve McCormick Washington Sep. 1993 148 p
(Contract NAS1-19312; RTOP 505-59-50-01)
(NASA-CR-4540; NAS 1.26:4540) Avail: CASI HC A07/MF A02

The efficient multilevel adaptive method has been successfully applied to perform direct numerical simulations (DNS) of flow transition in 3-D channels and 3-D boundary layers with 2-D and 3-D isolated and distributed roughness in a curvilinear coordinate system. A fourth-order finite difference technique on stretched and staggered grids, a fully-implicit time marching scheme, a semi-coarsening multigrid method associated with line distributive relaxation scheme, and an improved outflow boundary-condition treatment, which needs only a very short buffer domain to damp all order-one wave reflections, are developed. These approaches make the multigrid DNS code very accurate and efficient. This allows us not only to be able to do spatial DNS for the 3-D channel and flat plate at low computational costs, but also to do spatial DNS for transition in the 3-D boundary layer with 3-D single and multiple roughness elements, which would have extremely high computational costs with conventional methods. Numerical results show good agreement with the linear stability theory, the secondary instability theory, and a number of laboratory experiments. The contribution of isolated and distributed roughness to transition is analyzed. Author (revised)

EXPERIMENTAL INVESTIGATION OF TURBULENT PRANDTL NUMBER AND REYNOLDS ANALOGY IN TRANSITIONAL AND POST-TRANSITIONAL BOUNDARY LAYERS Final Report
Ting Wang Jul. 1993 62 p
(Contract N00014-89-J-3105)
(AD-A270092) Avail: CASI HC A04/MF A01

The effects of elevated free-stream turbulence and streamwise acceleration on flow and thermal structures in transitional boundary layers have been investigated experimentally on a heated flat plate. The effects on the turbulent Prandtl number and Reynolds analogy were included in this study. The free-stream turbulence levels ranged from 0.5 to 7%, and the acceleration strengths, based on K, ranged from 0.39x10 to the minus 6th power to 4.1x10 to the minus 6th power. A three-wire probe was used to measure the detailed momentum and thermal boundary layer structures, including the streamwise and cross-stream velocity fluctuations, the temperature fluctuation, the Reynolds stresses, the Reynolds heat fluxes, the eddy viscosity, the turbulent thermal diffusivity and the turbulent Prandtl number. The results show that elevated free-stream turbulence values result in an earlier onset of transition and reduced length of transition, whereas streamwise acceleration delays the onset of transition and lengthens the transition region, even at elevated FSTI. Compared to streamwise acceleration, FSTI is the more dominant factor on flow and thermal structure in transitional boundary layers; however, streamwise acceleration significantly reduces the turbulent spot formation rate. WAVE PROPAGATION NEAR EXPLOSIVE SOURCES
Lane R. Johnson 20 May 1993 32 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F19628-90-K-0055)
(AD-A270102; PL-TR-93-2118; AD-E201621) Avail: CASI HC A03

A basic goal of seismic yield estimation is to understand the relationship between the yield of an explosion and the amplitude of seismic waves radiated into the far field. Of particular interest in this relationship is the role played by material properties in the vicinity of the source. This study is an attempt to investigate this problem through the use of an equivalent elastic treatment for the region between the original cavity radius and the elastic radius. Equations are developed which allow the material properties to be modified as a function of the level of stress, and a propagator method is presented which solves the elastodynamic equations for a visco-elastic material with properties that vary as a function of radial distance from the explosive source. The relations between parameters measures in laboratory tests and the material properties required in wave propagation problems are also reviewed. While this approach is only an approximation to calculations with hydrodynamic and equation-of-state codes, it has the advantage of providing simple analytic results in which the role of various model parameters is easily investigated. RELATION BETWEEN THE FLUCTUATING WALL PRESSURE AND THE TURBULENT STRUCTURE OF A BOUNDARY LAYER ON A CYLINDER IN AXIAL FLOW Ph.D. Thesis - Northwestern Univ., 1992
Stephen R. Snarski 12 Aug. 1993 245 p
(Contract N00014-89-J-1439)
(AD-A270242; NUWC-NPT-TR-10223) Avail: CASI HC A11/MF A03

The turbulent flow structures responsible for the fluctuating wall pressure in the turbulent boundary layer on a cylinder in axial flow (delta/a = 5.04, Re(sub theta) = 2870) have been investigated. Simultaneous measurements of the fluctuating wall pressure and turbulent streamwise velocities have been performed throughout a large volume of the boundary layer (y(sup +) = 14 to y/delta = 1.91, 0 less than or equal to x/delta less than or equal to 1.52, azimuthal angle phi = 0 deg, 20 deg, 40 deg) with a subminiature electret microphone (d(sup +) = 25.9) and hotwire velocity probe (1(sup +) = 18.5). Pressure-velocity cross-spectra and cross-correlation measurements indicate that two primary groups of pressure fluctuations exist in the cylindrical boundary layer: (1) small-scale, high-frequency disturbances concentrated close to the wall associated with the burst-sweep cycle; and (2) large-scale, low-frequency disturbances extending from the wall to the turbulent/potential-flow interface that are consistent with a large spanwise-oriented 'vortex' in close contact with and inclined to the wall. VISUALIZATION FOR APPLICATIONS IN SHOCK PHYSICS
C. J. Pavlakos and D. L. Campbell 1993 4 p Presented at the Visualization 1993, San Jose, CA, 25-29 Oct. 1993
(Contract DE-AC04-76DP-00789)
(DE93-012849; SAND-93-0916C; CONF-931080-1) Avail: CASI HC A01/MF A01

This case study presents work being done to provide visualization capabilities for a family of codes at Sandia in the area of shock physics. The codes, CTH and Parallel CTH, are running in traditional supercomputing as well as massively parallel environments. These are Eulerian codes which produce data on structured grids. Data sets can be large, so managing large data is a priority. A supercomputing-based distributed visualization environment has been implemented to support such applications. This environment, which is based in New Mexico, is also accessible from our branch site in California via a long haul FDDI/ATM link. Functionality includes the ability to track ongoing simulations. A custom visualization file has been developed to provide efficient, interactive access to result data. Visualization capabilities are based on the commercially available AVS software. A few example results are presented, along with a brief discussion of future work. DOE

N94-18995# Lawrence Livermore National Lab., CA.
THERMAL STRESSES IN THE MICROCHANNEL HEATSINK COOLED BY LIQUID NITROGEN
R. A. Riddle 30 Jun. 1993 17 p Presented at the Annual Meeting of the Society of Photo-Optical Instrumentation Engineers (SPIE), San Diego, CA, 11-16 Jul. 1993

(Contract W-7405-eng-48)
(DE93-018660; UCRL-JC-114422; CONF-930722-15) Avail: CASI HC A03/MF A01

Microchannel heatsinks represent a highly efficient and compact method of heat removal in high heat flux components. Excellent thermal performance of a silicon microchannel heatsink has been demonstrated using liquid nitrogen as the coolant. For the heating of a 1 square centimeter area, at a heat dissipation of 500 W, a typical silicon heatsink cooled by liquid nitrogen has a thermal resistance of 0.046 sq cm K/W. The actual heatsink structure in this case is only 0.1 cm high. Silicon, although it has excellent thermal properties at liquid nitrogen temperatures, may fracture with very little plastic deformation due to mechanical and thermal stresses. Because the fracture strength of silicon depends on the presence of small defects, the strength of the heatsink structures must be addressed to insure highly reliable heatsink devices. Microchannel heatsink reliability can be affected by thermal stresses that arise due to temperature gradients between the base and fin and along the film length. These stresses are combined with the bonding stresses that arise in attaching components at elevated temperatures to the silicon heatsink and then cooling the structure to the cryogenic operating temperatures. These bonding stresses are potentially large because of the differences in the values of the coefficients of thermal expansion in silicon heatsink material, and the attached component materials. The stress results are shown for a 17:1 aspect ratio heatsink cooled in liquid nitrogen. The temperature gradients are a result of a surface heat flux of 1.3 kW/sq cm, approximating the heat dissipation of an RF power chip. The chip is connected to an aluminum nitride substrate, then the chip and substrate module are attached to the heatsink at a bonding temperature of 600 K, as for a gold tin eutectic bond. The stresses are shown to be within the allowables of the materials involved. DOE

(DE93-018342; LA-UR-93-2335; CONF-9303126-7) Avail: CASI HC A03/MF A01

The mixing behavior of two or more fluids plays an important role in a number of physical processes and technological applications. The authors consider two basic types of mechanical (i.e., non-diffusive) fluid mixing. If a heavy fluid is suspended above a lighter fluid in the presence of a gravitational field, small perturbations at the fluid interface will grow. This process is known as the Rayleigh-Taylor instability. One can visualize this instability in terms of bubbles of the light fluid rising into the heavy fluid, and fingers (spikes) of the heavy fluid falling into the light fluid. A similar process, called the Richtmyer-Meshkov instability occurs when an interface is accelerated by a shock wave. These instabilities have several common features. Indeed, Richtmyer's approach to understanding the shock induced instability was to view that process as resulting from an acceleration of the two fluids by a strong gravitational field acting for a short time. Here, the authors report new results on the Rayleigh-Taylor and Richtmyer-Meshkov instabilities. Highlights include calculations of Richtmyer-Meshkov instabilities in curved geometries without grid orientation effects, improved agreement between computations and experiments in the case of Richtmyer-Meshkov instabilities at a plane interface, and a demonstration of an increase in the Rayleigh-Taylor mixing layer growth rate with increasing compressibility, along with a loss of universality of this growth rate. The principal computational tool used in obtaining these results was a code based on the front tracking method. DOE

IMPLEMENTATION OF THE TURN FUNCTION METHOD IN KIVA-F90
P. J. ORourke and M. S. Fairfield Aug. 1993 34 p
(Contract W-7405-eng-36)
(DE93-018394; LA-12536-MS) Avail: CASI HC A03/MF A01

We document the implementation of the Turn Function Method (TFM) in KIVA-F90, a version of the KIVA computer program written in the FORTRAN 90 programming language that is used on some massively parallel computers. TFM solves both linear momentum and vorticity equations in numerical calculations of compressible fluid flow. Solving a vorticity equation allows vorticity to be both conserved and transported more accurately than is possible in traditional methods for computing compressible flow. To calculate the convective transport of vorticity more accurately, we have also implemented an improved method for the rezone phase of the KIVA computational cycle. This first implementation of TFM in a three-dimensional hydrodynamics code involved some modification of the original method and some novel numerical difference approximations. In particular, we used a penalty method to keep the divergence of the computed vorticity field close to zero. Also, difference operators are defined in such a way that the finite difference analog of divergence of curl of u = 0 is exactly satisfied. Three example problems presented in this report show the greater accuracy that can be gained when TFM is used for calculations of flows with rotational motion, as well as the added computational costs incurred. Use of the method can increase by 60% the computational times of the Euler equation solver in KIVA-F90. Although TFM sometimes does degrade accuracy in calculations that have large vorticity gradients, generally the calculations show beneficial effects of TFM on accuracy. We will continue to evaluate the costs and benefits of TFM in future KIVA-F90 calculations. DOE

NUMERICAL SOLUTIONS FOR A FLOW WITH MIXED CONVECTION IN A VERTICAL GEOMETRY
J. R. Torczynski 1993 37 p Presented at the Annual Winter Meeting of the ASME, New Orleans, LA, 28 Nov. - 3 Dec. 1993
(Contract DE-AC04-76DP-00789)
(DE93-011592; SAND-93-0186C; CONF-931121-5) Avail: CASI HC A03/MF A01

The K-12 Aerospace Heat Transfer Committee of the American Society of Mechanical Engineers recently specified a computational benchmark problem involving steady incompressible laminar flow with mixed convection using the Boussinesq approximation in a two-dimensional backstep geometry. FIDAP v6.0 (Fluid Dynamics International) and NEKTON v2.85 (Nektonics, Fluent) are capable of simulating situations with this type of coupled fluid flow and heat transfer. FIDAP uses conventional finite elements and has both steady and transient solvers, whereas NEKTON uses spectral elements with a transient solver (for large problems). Numerical solutions to the benchmark problem are obtained with both of these codes, and grid-refinement studies are performed to verify that grid-independence is achieved. The grid-independent solutions from both codes are found to be in excellent agreement with each other and with results in the archival literature regarding velocity and temperature profiles and the locations of separation and reattachment points. TIME DOMAIN CALCULATIONS OF THE SECOND-ORDER DRIFT FORCE ON A FLOATING TWO-DIMENSIONAL OBJECT IN CURRENT AND WAVES

H. J. Prins and A. J. Hermans 1993 21 p
(Rept-93-13; ETN-93-94640) Avail: CASI HC A03/MF A01

The influence of a current on the horizontal drift force is studied for a horizontal cylinder of infinite length. A theory which is correct up to second order in the current velocity is developed. It is shown that especially for higher velocities these second order terms become very important. A numerical algorithm which solves the time dependent equations and is stable for all current velocities is found. A computer program is developed and very encouraging results are found for the added mass and damping coefficients and the drift force. ESA

SIMILARITY SOLUTIONS FOR GRAVITY-DOMINATED SPREADING OF A LENS OF ORGANIC CONTAMINANT
Clarence A. Miller (Rice Univ., Houston, TX.) and Cornelis J. vanDuijn 1993 23 p Sponsored in part by Kerr (Robert S.) Environmental Research Lab., Ada, OK
(Rept-93-24; ETN-93-94651) Copyright Avail: CASI HC A03/MF A01

Similarity solutions for gravity dominated spreading at the water table of a lens of organic liquid largely immiscible with water are developed. Different solutions deal with different mechanisms by which the lens volume decreases with time: dissolution or evaporation, trapping as water invades the region beneath the central part of the lens, and uniform degradation. In the last case, the solution is a special case of the Barenblatt-Pattle solution. The same is true for the limiting case of a lens of constant volume. In all cases information is presented on variation of lens radius and thickness with time. All solutions except that involving trapping can be carried over with minor modifications to the case of a lens simultaneously spreading and translating along a slightly inclined water table. ESA

MULTIGRID FOR A GROUNDWATER FLOW PROBLEM
J. Molenaar 1993 15 p
(Rept-93-29; ETN-93-94656) Copyright Avail: CASI HC A03/MF A01

The stationary, two dimensional, gravity driven flow of fresh and salt water in a horizontal aquifer is studied. A mathematical model for the problem which is based on the introduction of a stream function is presented. A finite volume discretization is proposed and a multigrid algorithm for the iterative solution of the resulting system of nonlinear equations is developed. If the difference in specific weight of the salt and fresh water is ignored the problem reduces to a Dirichlet problem, and an efficient Jacobi type smoother for the standard five-point discretization of the Laplace operator is proposed. Some results from numerical experiments are presented. ESA

A SIMPLE DESCRIPTION OF FLOW INSTABILITY WITH APPLICATION TO A PACKED BED
D. Dobranich 1993 8 p Presented at the 10th Symposium on Space Nuclear Power and Propulsion, Albuquerque, NM, 10-14 Jan. 1993
(Contract DE-AC04-76DP-00789)
(DE93-017492; SAND-93-1263C; CONF-930103-43) Avail: CASI HC A02/MF A01

A simplified explanation for gas flow instability in parallel heated channels is presented with specific applications to channels containing packed beds of power-producing particles. The explanation captures the basic governing physics of the viscosity-driven instability and hopefully removes some of the misconceptions surrounding this issue. Simple illustrative calculations, steady-state and transient, using the SAFSIM computer program are included in the explanation. The explanation points out that flow instability is common to any and all gas flow systems with parallel heated channels, that the addition of flow resistance to the entrance of a channel mitigates flow instability, and that instabilities do not occur instantaneously. THE EFFECT OF FINE SURFACE RIBLETS ON THE FLOW AROUND AN INCLINED AXIALLY SYMMETRICAL BODY [ZUR WIRKUNG FEINER OBERFLAECHENRILLEN AUF DIE UMSTROEMUNG EINES ANGESTELLTEN ROTATIONSKOERPERS]
Michael Schneider 1993 78 p In GERMAN
(MPIS-105/1993; ETN-93-94838) Avail: CASI HC A05/MF A01

The dependence of the friction drag of a body of revolution (axially symmetric body) on the body surface structure and on the angle beta between the body axis and the flow direction is investigated. The experiments were performed in a water tunnel with flow velocities from U(sub infinity) = 0.5 to 5.5 m/s. The surface of the test body was covered either with smooth film or with different V groved riblet films with the riblet direction parallel to the body axis. The angle of the incidence beta varied between beta = 0 and 7 degrees. The experiments show that over a wide range of Reynolds number and for all angles of incidence investigated the friction drag with riblet film is smaller than with the smooth reference film. Drag reductions of about 10% were measured. The results indicate that riblet film can have a favorable influence on the three dimensional boundary layer occurring on an inclined axially symmetric body. The trend of the experimental data indicates that this favorable effect will continue to occur at angles greater than 7 degrees. ESA

(ETN-93-95020) Avail: CASI HC A08

Theoretical and approximation problems involving the theory of gas dynamics are discussed. The mathematical model used to represent these physical phenomena is the system of Euler conservation laws equations. Numerical approximation of the solutions were obtained by boundary value problems. The numerical solution results are based on the finite volume method which is the most currently applied to conservation laws. The boundary value problem convergence was obtained by the finite volume method, and by using the uniqueness solutions of the conservation law equations. ESA

(ECL-93-05; ETN-93-94897) Avail: CASI HC A07/MF A02

An approach to investigate the effect of Coriolis forces in homogeneous turbulence during rotation is presented. The spectral tensor equation was solved in the spectral space. The direction of the energy field can be characterized by its polarization component. An extension of homogeneous turbulence model under strain is proposed. The results showed that the equation second order terms should be developed, however an approach based on the spectral theory was chosen. The model consists of splitting the classic deviator a(sub i, j) into two components, which correspond to directional dependence and tensor polarization in Fourier space. ESA

The method used to compute the conservative Navier-Stokes equations is implicit in time and makes no use of factorization in space. It is based on the 'Delta' formulation of Pade. This method is implemented in terms of curvilinear coordinates, which allows for a better description of the flow behavior in complex geometry; this permits better treatment of the boundary conditions. A finite volume formulation was chosen. For the spatial differences, an upwind scheme is used. This scheme is implemented with the flux vector splitting technique of Van Leer. The spatial derivatives of splitted fluxes (backward and forward) were approximated as a flux balance in the control volume, using a MUSCL (Monotone Upstream Centered Schemes of Conservation Laws) method. The viscous terms are approximated by classical second order centered differences. The iterative Gauss-Seidel's method while convergence was accelerated with the MMPE (Modified Minimal Polyomial Extrapolation) method and a particular storage of matrix was adapted. A modular approach is presented which permits the use of different numerical schemes in time and space as well as the performance of calculations which are steady or not, viscous or non-viscous, and two or three dimensional. The model was validated for one and two dimensional configurations, varying from incompressible to transonic, and for three dimensional configurations. ESA

(ECL-92-28; ETN-93-94590) Avail: CASI HC A13/MF A03

The mass conservation equation, the momentum and the energy equation are statistically described. The problems of parameters closure due to compression effects are discussed. The volume mass fluctuations are analyzed by numerical approximations. Two models which describe the interaction of volume mass fluctuations and the mean pressure gradient are given. The inadequacy of the classical K-epsilon model, based on scalars which do not represent anisotropy, is demonstrated. A new model that takes into account the anisotropy effect of gravity on turbulence is proposed. The model is applied to hot jets in a steady atmosphere and to the study of the behavior of thermal and kinetic atmosphere layers. ESA

(ECL-93-13; ETN-93-94899) Avail: CASI HC A09/MF A02

The purpose of the study was to develop a one dimensional model to describe as accurately as possible the symmetric flow film. The physical bases of capillarity phenomena are reviewed. The effect of tensio-active elements on the film configuration and on the surface energy gradients is investigated. The phenomena controlling the motion of tensio-active molecules in the bulk and on the surface are studied. The isothermal stationary liquid flow is modeled in the symmetric film configuration. A method of mobile grids associated with the finite volume method is applied to solve a two dimensional film flow system. ESA

A process for numerical simulation of viscous, chemically reacting hypersonic flows is developed. The flow was divided into an inviscid part, which was calculated with a Euler process, and a viscous part, simulated with a boundary layer process of second order. The method is proved to be useful for reentry trajectories because boundary layer equations can be solved with a space marching process with low calculation costs. Boundary layer equations were derived from Navier-Stokes equations and written in a local monocline coordinates system; conditions and models of statistical thermodynamics, chemical properties, and transport coefficients such as viscosity, heat capacity, and diffusion coefficients were used for the equation closure. The resulting system and Euler equations were solved with a difference process and the coupling of both systems is discussed. The method was successfully applied to the three dimensional flow around the Hermes forebody. ESA

Coupling between space imaging and digital simulation to study the sediment transfer in local aquatic areas is still recent. The development and the numerical statement of mathematical models for free surface hydrodynamics and Suspended Sediment (SS) transport is dealt with. The solid transport phenomena, the capabilities to couple space imaging and digital models at local scales are reviewed. The one Dimensional (1D), 2D and 3D mathematical models, are presented. Their enhancements on a finite element code, MEFAME (1D and 2DH), and on a finite volume code, PHOENICS, follow. The 2DH and 1D models are applied on the Gambia estuary. Maps of instant and residual velocities and maps of concentrations are analyzed with information arising from SPOT image treatments. The developments of two original numerical modules in the 3D Navier-Stokes solver is then focused upon: the first deals with the free surface consideration and its semi implicit transient calculation in a fixed grid mesh, the second deals with the 3D SS transfer. Some 3D test cases relating to the flow around a groyne and to the sediment transfer in open channel flows under equilibrium and nonequilibrium conditions are presented and analyzed. ESA

FILM CONDENSATION IN A SHOCK WAVE Thesis
[FILMKONDENSATION IM STOSSROHR]

Thomas Teske Sep. 1992 152 p In GERMAN
(MPIS-22/1992; ETN-93-95102) Avail: CASI HC A08/MF A02

Interferometric thickness measurements on n-heptane film condensation in a shock tube are carried out for investigation of the dynamical and thermodynamic processes involved in fuel condensation on the walls of engines and for determination of the time dependence of film thickness on the side and end walls of the tube as a function of gas initial state. Some theoretical results about condensation and supersaturation are discussed such as the Stefan problem and the solution given by Neumann. Transition state is described assuming one dimensional flow, thermally ideal gas, and constant physical properties of film and wall. The homogeneous nucleation in the boundary layer is neglected and thermal conductivity and shear viscosity are presumed to be linear in temperature. The interference of light beams reflected from both sides of the liquid film is used for the optical measurement. The resulting thickness is calculated from intensities of reflected or transmitted light. Time scales results are found to be higher than the time from fuel injection until auto-ignition. ESA

TWO-DIMENSIONAL TURBULENT NONSTATIONARY SUPERFLUID COUNTERFLOWS: NUMERICAL SIMULATIONS, QUALITATIVE EFFECTS

W. Fiszdon (Polish Academy of Sciences, Warsaw.), J. Piechna (Warsaw Technical Univ., Poland.), and G. Stamm Oct. 1992 80 p
(MPIS-23/1992; ETN-93-95103) Avail: CASI HC A05/MF A01

Numerical simulations of simple cases of plane and axisymmetric two dimensional turbulent nonstationary superfluid counterflows were performed. The purpose was to obtain qualitative information on their structure. A closer picture of the real flows and help in assessing the limitation of the often used one dimensional treatment of real superfluid flows are expected. The influence of the boundary layer appears to be rather small, leading to the curvature of temperature shocks in straight channels and to a not strictly top hat distribution of flow parameters in a cross section of the tube. Discontinuities in the channel shape lead to nonstationary nonlocal flow perturbations inside the channel. Local flow parameters may be affected by multi-dimensional flow effects. ESA

STABILITY MEASUREMENTS OF RAYLEIGH-BENARD CONVECTION NEAR THE CRITICAL STATE USING A SPECTRAL MODEL Thesis
[STABILITAETSUNTERSUCHUNGEN DER RAYLEIGH-BENARD-KONVEKTION IN DER NAEHE DES KRITISCHEN ZUSTANDS MIT HILFE EINES SPEKTRALMODELLS]

Ralph Nolte Jul. 1992 83 p In GERMAN Sponsored by Studienstiftung des Deutschen Volkes
(MPIS-15/1992; ETN-93-95100) Avail: CASI HC A05/MF A01

Hydrostatic stability of a horizontal fluid layer heated from below is lost if the temperature gradient exceeds a critical value. The onset of convection in a fluid near its gas liquid critical point is investigated theoretically. Hydrostatic density and temperature profiles were computed numerically. The orders of magnitude of the terms occurring in the dynamical equations were estimated, showing that due to the divergence of the compressibility in the critical region pressure terms neglected in the Boussinesq approximation have to be retained. A Galerkin method was applied to the two dimensional problem, and a low order truncation which far from the critical point reduces to the familiar Lorenz equations was analyzed. According to this model the critical Rayleigh number decreases to a finite value while the corresponding horizontal wavenumber increases as the system approaches the critical state. ESA

THEORETICAL EXAMINATION OF THE FLOW AROUND A CYLINDER WITH A LOW DIMENSIONAL GALERKIN PROCESS Thesis
[THEORETISCHE UNTERSUCHUNG DER ZYLINDERUMSTROEMUNG MIT EINEM NIEDRIGDIMENSIONALEN GALERKIN-VERFAHREN]

Bernd R. Noack Nov. 1992 112 p In GERMAN
(MPIS-25/1992; ETN-93-95105) Avail: CASI HC A06/MF A02

A low dimensional Galerkin method with less than 200 global modes is presented for the three dimensional, incompressible, viscous flow around a circular cylinder. In particular, important mathematical and physical aspects for the construction of successful Galerkin methods for wake flows are systematically investigated for the ,cylinder wake. With this method, the steady, periodic, and turbulent wakes were computed for Reynolds numbers up to 300. Furthermore, the first global, non-parallel, three dimensional stability analysis of the steady and periodic solution is presented. This stability investigation explains the experimental observation of large scale three dimensional structures in the laminar wake and the formation of small scale, in spanwise direction, periodical structures in the turbulent wake. ESA

LOCALLY ADAPTIVE REMESHING SCHEME FOR CALCULATING FLUID INSTABILITIES

G. D. Kramer, W. P. Crowley, and V. C. Rupert Jul. 1993 7 p
Presented at the 19th International Symposium on Shock Waves, Marseille, France, 26-30 Jul. 1993
(Contract W-7405-eng-48)
(DE93-019577; UCRL-JC-114801; CONF-930788-5) Avail: CASI HC A02/MF A01

LAM is a two dimensional Eulerian hydro-code with local adaption that uses a Van Leer limiter, artificial viscosity, and a staggered mesh. It differs from the Godonov schemes used elsewhere, but this formulation makes it easier to add additional physics to the code. Two distinct advantages of the present code are a conformal quadrilateral mesh option and a grow capability. The code is presently being extended to three dimensions. DOE

AN INVESTIGATION OF LOW MARANGONI NUMBER FLUID FLOW IN A COLD CORNER M.S. Thesis

Michael R. Huber Jun. 1993 91 p
(AD-A271317) Avail: CASI HC A05/MF A01

A large pool of liquid with a horizontal free surface is bounded on one side by a vertical solid wall. The wall is maintained at a cold temperature to a depth of unity, with a warmer temperature below that point. The fluid surface is assumed adiabatic, and average surface tension forces keep the surface flat. Surface tension is assumed to be a decreasing function of temperature, so that the surface thermal gradient associated with the temperature variations drives flow toward the corner. This problem is examined numerically for different Marangoni numbers ranging from 1 to 300 using a Green's function approximation method for viscous case (in the limit as the Reynolds number approaches zero). (Contract N00014-91-J-4038)
(AD-A270835; AI-TR-1412) Avail: CASI HC A06/MF A02

This report describes MM, a computer program that can model a variety of mechanical and fluid systems. It addresses several issues: What is the appropriate input to the modeling process? How should the search for models be organized? What evidence can be brought to bear to constrain the task? MM takes as input both a description of the structure of the system to be modeled and a trace of the system's behavior. The structure can be represented by 2D line drawings augmented with some additional information, or by component types and their interconnections, or both. The behavior trace provides the program with qualitative information about the behavior that the user wishes to capture with a model. DTIC

Using the property of invariance under Lie groups of transformations, the equations of hydrodynamics are transformed from partial differential equations to ordinary differential equations for which special analytic solutions can be found. These particular solutions can be used for the following: (1) numerical benchmarks; (2) the basis for analytic models; and (3) insight into more general solutions. Additionally, group transformations can be used to construct new solutions from existing ones. A space-time projective group is used to generate complicated solutions from simpler solutions. Discussion of these procedures is presented along with examples of analytic solutions of 1-, 2-, and 3-D hydrodynamics. DOE

VISUALIZATION OF TURBULENT FLOW WITH PARTICLES
Andrea J. S. Hin and Frits H. Post 1993 15 p Sponsored in part by Delft Hydraulics Lab. Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Rept-93-31; ETN-93-94658) Copyright Avail: CASI HC A03

A method for visualization of three dimensional turbulent flow using particle motion animation is presented. The method is based on Reynolds decomposition of a turbulent flow field into a convective and a turbulent motion. At each step of particle path generation, a stochastic perturbation is added, resulting in random walk motions of particles. A physical relation is established between the perturbations and the eddy diffusivity, which is calculated in a turbulent flow simulation. The flow data used is a steady mean velocity field, and an eddy diffusivity field. The erratic particle motions are more than just a visual effect, but represent a real physical phenomenon. An implementation of the method is described, and an example of a turbulent channel flow is given, which clearly shows the random particle motions in their context of general fluid motion patterns. A REVIEW OF HOT-WIRE TECHNIQUE IN COMPRESSIBLE FLOWS
F. Motallebi Jun. 1993 72 p Sponsored by the International Office, and Tech. Univ. Delft, Netherlands
(LR-724; ETN-93-95028) Avail: CASI HC A04/MF A01

The use of hot wire anemometer for obtaining turbulence data in compressible flows is reviewed. Based on the existing experimental results, the methods of extracting different turbulent quantities from the output signal of the hot wire anemometer in a given flow environment are described and evaluated. Comparison between the results obtained with the laser Doppler velocimeter and the hot wire anemometer shows that the latter should still be considered as one of the main tools for turbulence research in compressible non-separated turbulent flows not only for its comparable accuracy but also for its much lower cost and ease of operation as compared with the optical methods. EXAMINATIONS OF THE FRICTION BEHAVIOR IN NONSTATIONARY FLOW PROCESSES IN PIPES Ph.D. Thesis [UNTERSUCHUNG DES REIBUNGSVERHALTENS BEI INSTATIONAEREN STROEMUNGSVORGAEGEN IN ROHRLEITUNGEN]
Peter Eichinger 1992 153 p In GERMAN Sponsored by DFG Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Mitt-7; ISBN-3-98-021306-4; ETN-93-95074) Avail: CASI HC A08

A calculation procedure is presented in order to use an improved unsteady friction term. The method of characteristics for the water hammer calculation along the pipe axis and a finite difference calculation of the unsteady radial velocity distribution were combined. Various turbulence models, which are used for the calculation of the velocity distribution along the radius for laminar and turbulent flow, were considered. The turbulence models are as follows: the Prandtl mixture length model; a one equation model in which kinetic turbulent energy is calculated with a transport equation; and the k-epsilon model. The procedure was validated with experimental results of fluctuating single pressure peaks and with examples from the literature. ESA

THE EFFECTS OF INITIAL CONDITIONS ON THE 3-D TOPOLOGY OF TEMPORALLY EVOLVING WAKES (ARI ON 3-D BLUFF BODY WAKES) Final Report
Brian J. Cantwell 27 Sep. 1993 10 p
(Contract N00014-90-J-1976)
(AD-A271008) Avail: CASI HC A02/MF A01

A three year study of the effect of initial conditions on the topology and fine scale structure of temporally evolving wakes was completed. Early in the project new topological analysis tools were developed and used to analyze available simulations of the plane mixing layer. During the course of these preliminary studies it was found that certain geometrical features of the fine scale motions in the mixing layer were very similar to those seen in simulations of forced isotropic turbulence. As a consequence, a two-track approach to the work was adopted; one track was to gather together simulation data on as wide a variety of shear flows as possible with the objective of identifying universal feature of the fine scale structure. The second track was to carry out a new direct simulation of the plane wake in which systematic variations of the initial conditions were used to identify structural features of the developed flow which depend on initial conditions. The fundamental questions addressed were: what features of the fine scale motions in turbulent flow are universal, what features are not, and, in the case of the plane wake, what information about the near wake survives far downstream? VISAR (Velocity Interferometer System for Any Reflector) is a specialized Doppler interferometer system that is gaining world-wide acceptance as the standard for shock phenomena analysis. The VISAR's large power and cooling requirements, and the sensitive and complex nature of the interferometer cavity, has restricted the traditional system to the laboratory. This paper describes the new portable VISAR, its peripheral sensors, and the role it played in optically measuring ground shock of an underground nuclear detonation (UGT). The Solid State VISAR uses a prototype diode pumped ND:YAG laser and solid state detectors that provide a suitcase-size system with low power requirements. A special window and sensor was developed for fiber optic coupling (1 kilometer long) to the VISAR. The system has proven itself as a reliable, easy-to-use instrument that is capable of field test use and rapid data reduction employing only a personal computer (PC). DOE

FRICTION DRIVE POSITION TRANSDUCER Patent
Ronald E. Waclawik, inventor (to Navy), James L. Cayer, inventor (to Navy), and Kenneth M. Lapointe, inventor (to Navy) 22 Jun. 1993 8 p Filed 28 Oct. 1991
(AD-D015851; US-Patent-5,220,731; US-Patent-Appl-SN-783660; US-Patent-Class-33-773) Avail: CASI HC A02/MF A01

A spring force loaded contact wheel mounted in a stationary position relative to a reciprocating shaft is disclosed. The apparatus of the present invention includes a tensioning assembly for maintaining absolute contact between the contact wheel and the reciprocating shaft wherein the tensioning assembly urges the contact wheel against the shaft to maintain contact there between so that the wheel turn as the shaft is linearly displaced. A rotary encoding device is coupled to the wheel for translating the angular and rotational movement thereof into an electronic signal for providing linear displacement information and derivative data with respect to displacement of the shaft. Absolute friction contact and cooperative interaction between the shaft and the contact wheel is further enhanced in the preferred embodiment by advantageously selecting the type of surface finish and the amount of surface area of the contact wheel relative to the surface condition of the shaft as well as by reducing the moment of inertia of the contact wheel. SOLID-STATE, RESISTIVE HYDROGEN SENSORS FOR SAFETY MONITORING
B. S. Hoffheins, R. J. Lauf, P. H. Fleming, and S. E. Nave (Westinghouse Savannah River Co., Aiken, SC.) 1993 16 p Presented at the 3rd International Joint ISA POWID/EPRI Controls and Instrumentation Conference, Phoenix, AZ, 7-9 Jun. 1993
(Contracts DE-AC05-84OR-21400; DE-AC09-89SR-18035)
(DE93-017769; CONF-930672-1) Avail: CASI HC A03/MF A01

Solid-state, resistive hydrogen sensors have been designed and fabricated at Oak Ridge National Laboratory. Sensor response has been successfully tested with H2 gas in argon and air under ambient temperature and pressure, while immersed in transformer oil at temperatures between 25 and 90 C, and under site-specific conditions at Westinghouse Savannah River Co. Current versions of the sensors (25 x 25 x 0.6 mm) are small enough to be incorporated into hand-held leak detectors or distributed sensor systems for safety monitoring throughout a large area. Another foreseeable application is in electrical power transformers where the buildup of hydrogen gas accompanies oil breakdown. The use of these sensors to monitor transformer oil changes could help predict and prevent catastrophic failure. DOE

FLUID DYNAMOMETER HAVING FLUID CHARACTERISTIC POWER ABSORPTION ADJUSTMENT CAPABILITY Patent Application
James R. Quararone, inventor (to Navy) 29 Mar. 1993 18 p
(AD-D015820; US-Patent-Appl-SN-037880) Avail: CASI HC A02/MF A01

A fluid dynamometer is provided for absorbing a range of power output produced by an engine's rotating shaft. Power absorbing characteristics are controlled by adjusting the fluid media characteristics in terms of its temperature and/or its density and viscosity. A tank, containing an energy or power absorbing fluid, receives the rotating shaft. One or more disks, submerged in the fluid and coaxially mounted on the rotating shaft for rotating therewith, cooperate with the fluid to absorb power from the rotating shaft. The disk(s) are sized so that a first specified amount of power from the rotating shaft is absorbed at a calibration temperature of the fluid. Heating and cooling units are provided to respectively heat and cool the fluid. A controller energizes the heating and cooling units in a cooperative fashion to adjust and maintain the fluid at a predetermined temperature value for power absorption at a second specified amount of power produced by the rotating shaft. A fluid composition exchanger may also be provided to alter the power absorbing characteristics by altering the fluid's composition. DTIC

CHARACTERISTICS AND PULSED RADIATION RESPONSE OF NON-IDEAL QUARTZ SHOCK STRESS GAUGES
R. P. Reed and J. I. Greenwoll 1993 4 p Presented at the 14th International Conference of the International Association for the Advancement of High Pressure Science and Technology, Colorado Springs, CO, 27 Jun. - 2 Jul. 1993
(Contract DE-AC04-76DP-00789)
(DE93-017628; SAND-93-0376C; CONF-930676-7) Avail: CASI HC A01/MF A01

This cautionary paper reminds users of quartz shock stress gauges that sensors that ignore the design rules of the 'Sandia quartz gauge' may produce substantial and unrecognized deviations from normal sensitivity, waveform distortion, and anomalous conduction. Each deviant design must be extensively characterized. The consequence of non-standard gauge designs, like the 'shorted quartz gauge' designs, are given for prompt response to pulsed radiation while stressed. DOE

The ownership of clocks and watches became widespread in 18th century society, particularly amongst the wealthy classes. They liked the decorative appearance, practical advantages, and social prestige which those objects conferred. The use of 'mechanized' time in the towns supplanted the age old reliance on time as dictated by nature and the Church. New temporal reference points gave the day its rhythm. Data from that era (correspondence, memoirs, newspapers, engravings, and paintings) make it possible to catch a glimpse of the influence of clocks on the perception of time. From the beginning of the 'mechanized time' era, efforts to improve the accuracy and the technical performance of mechanisms were made. The importance of such a precise time measurement in every day life is considered. ESA

Three tarnish testing procedures were applied to four gold alloys widely used in decorative applications. A liquid based method known as the Tuccillo-Lielsen test, where samples are alternatively immersed in an aqueous sulphide solution, was used. In the gaseous phase, the alloys were exposed to thioacetamide and flower of sulphur vapors. The tarnished samples were characterized by calorimetric measurements. The results showed that the tarnishing aspect encountered can be reproduced. The liquid based test was faster (3 hours) than those in the gaseous phase (5 days) but it is difficult to apply to any forms of finished products. Poor reproducibility and reliability was obtained by the thioacetamide test results. In addition, the color changes after 5 days exposure at ambient temperature were small and thioacetamide is a carcinogen. It is proposed to replace the thioacetamide tests by the flower of sulphur test. ESA

Nickel and nickel alloys are often used by watch makers, and several watch parts can release nickel. Coming from the substrate or from the coatings, nickel reaches the skin. Nickel is by far the most common cause of contact allergy. Sensitization can be obtained by prolonged and close contact with the skin. Different methods can be used to determine the nickel content of watch parts. The relationship between the analysis results and dermatisis risk is under investigation. ESA

Brass is covered with titanium-carbon:hydrogen layers using the technique of reactive radio frequency magnetron plasma deposition in an atmosphere enriched by methane. The deposited films exhibited special properties: high hardness, low friction coefficient, high scratch resistance, and good adhesion. These products are suitable for tribological purposes in situations where lubrication with grease is not possible. The variation of the methane flow rate can change the optical properties: from a bright silver-grey at low rates to a dark anthrazite at relatively high methane flow rates. The deposited Ti-C:H films are also suitable for scratch resistive and decorative surface protection in commodity utensils. ESA

Sputtering processes enable the use of materials combined with precisely tailored properties to generate hard and decorative coatings in different substrate materials. Thin films of titanium nitride can be deposited onto polymer substrates by reactive high frequency sputtering. Among the polymers successfully coated were polyvinyl chlorides and fluorides. In comparison to the coating process of metallic substrates, the specimen surface temperature of the polymers has to be kept low. The intrinsic stress of the thin films can be reduced by choosing a suitable working gas pressure as well as interrupting the coating procedure several times. The use of chromium interlayers enabled TiN films to be produced with a thickness of about 1 to 2 microns with good adhesion properties in the polymer substrates. The decorative requirements were found to be very similar to films in metallic specimens. ESA

An ultrasonic motor was developed for use in new generation watches and portable information devices. This motor shows promise as a new principle actuator. Measuring 10 mm in diameter and 4.5 mm thick, this ultrasonic motor is the world's smallest for practical use. Powered by a single lithium coin battery, this motor is expected to be applied to a broad range of miniature devices, including watches. The structure of the motor makes it possible to reduce its size and drive frequency. This motor was used to incorporate a silent alarm into an analog quartz watch. Unlike conventional electronic alarm watches, an eccentric weight rotates intermittently at high speed generating gentle vibration which notifies the wearer. The silent alarm analog quartz watch which incorporates the new ultrasonic motor, as well as the influence of design parameters on the performance of the ultrasonic motor, are described. ESA

A model of a quartz controlled clockwork, which simulated both the electrical and the kinematical behavior of a driving system for any control voltage, is presented. The driving system consists of the step motor and the gearing with two transmissions. The model calculates the resulting impact pulses within the bearings of every single cogwheel as a measure for the initiated working noise. The model allows the simulation of the work behavior for free defined, regulated control voltages according to a given regulation criterion. The basic temporal interdependencies of the essential system quantities and the elaboration of the criteria for a regulated disconnection are described. It is shown, that only a suitable combination of the selected control voltage and the regulated disconnection can lead to an acceptable noise reduction of more than 10 dB. ESA

MARINE CHRONOMETRY IN THE NEUCHATEL MOUNTAINS (SWITZERLAND) [LA CHRONOMETRIE DE MARINE DANS LES MONTAGNES NEUCHATELOISES]
Estelle Fallet *In* Societe Suisse de Chronometrie, Proceedings of the 4th European Congress on Chronometry 1992 p 89-94 In FRENCH (For primary document see N94-18006 04-35)
Copyright Avail: CASI HC A02/MF A02

The history and evolution of the Swiss marine chronometer industry are summarized. From the 18th century onwards, Neuchatel watchmakers strove to develop precision horology. First J. F. Houriet and later S. Mairet, L. Richard, W. Dubois and H. Grandjean introduced the marine chronometer in the Neuchatel mountains. Precision having become a necessity for the industry, they helped achive this by means of a complex system for the distribution and maintenance of exact time, which allowed optimal adjustment. These men of vision called for the building of a cantonal observatory and strove to have their art practiced in modern watchmaking schools. Under the guidance first of Ulysse and then of Paul David Nardin, the manufacture of marine chronometers began in Le Locle in 1876. In La Chaux-de-Fonds at the beginning of the 20th century, Paul Ditisheim built a number of improved marine, ship and pocket chronometers. Together with scientists and watchmakers, the chronometer makers perfected the regulating parts of the timekeepers and solved the problems of adjustment caused by the various external influences. The manufacturers, the watchmakers at their branches, the timers and the Neuchatel business all contributed to strengthening the position of the products of their region in the world market. ESA

RESTORATION OF AN 18TH CENTURY ENGLISH CLOCK [RESTAURATION D'UNE HORLOGE ANGLAISE DU 18TH SIECLE]
Daniel Curtit and Jean-Michel Piguet *In* Societe Suisse de Chronometrie, Proceedings of the 4th European Congress on Chronometry 1992 p 95-97 In FRENCH (For primary document see N94-18006 04-35)
Copyright Avail: CASI HC A01/MF A02

The background knowledge and the steps required to repair ancient clocks and watches are described. The restoration of old clocks and watches involves the problem of making them work. The wear that results from years of use and the fact that parts are lost or broken leads the restorer to replace certain component parts of the watch or clock. The parts are made in such a way that they fit in with the appearance of the object. This work requires the watchmaker/restorer to have a thorough knowledge of all the mechanisms used in watchmaking and knowhow which covers the whole field, from watches to monumental clocks. An example of a restoration carried out on a Bracket clock is given. ESA

The method and technology to analyze the train wheel behavior of a watch using a laser beam are described. Progress in automatic assembly of analog watch movement is considered. After assembling, however, the train wheel behavior is manually inspected, and automation is desired. A laser beam scanning method was developed to analyze wheel behavior. The system comprises a beam control unit in which an acoustic optical element is used, a signal processing unit, and a personal computer. In this system, the teeth of train wheels running at high speed and from the background of the teeth is continuously analyzed to permit time series understanding of the quantity and direction of wheel rotation. The dynamic train wheel behavior of the movement can be analyzed in detail. The configuration and measuring method are described in detail, and the result of the behavior analysis is touched upon. ESA

Several techniques used for designing integrated circuits are summarized. These techniques are currently applied and of major importance in the electric clock and watch industry. It is shown that these techniques must be applied at all the steps of integrated circuit production: from the architecture layouts to the putting together stage. The results show that energy consumption is related to the number of components in a circuit: few elements is equal to low consumption. Moreover, a low number of components reduce the risk of imperfections. ESA

Two power consumption analyses of electronic watches and future trends are presented. The analysis of the distribution of power consumption enables the parts that mainly determine battery life to be localized. It is important to notice that the stepper motor used to drive the hands of a watch already consumes as much as the quartz oscillator at 32 kHz and the dividers. The self discharge of the battery is almost equal to the consumption of the electronic circuits. The processor architecture and the basic cells originate from knowhow in very low power cicuits. Since the microprocessor in a watch is only active during a small period of battery life, the average power consumption of the microprocessor accounts for only a few percent of the total power dissipation. ESA

An optimized system, comprising watch motor and an Integrated Current (IC) with motor current regulation enables a reduction of the system current (IC and motor) up to 50% when compared to a solution with no motor current regulation. This leads to a significantly longer battery life, or alternatively permits the development of even flatter modules, and reduces the noise level. This kind of system improvement is not only applicable to watches, but also to clocks (IC with motor current regulation). However only watch applications are considered. In order to cover the complete spectrum of application areas, two algorithms are offered for motor current regulation. These can for example supply the means to system optimization for 1.5 V and 3 V applications. ESA

A lot of time was spent in designing the tooth form because there was no Computer Aided Design (CAD) system suitable for designing the tooth form of gears. A CAD system to support the tooth form design to promote efficiency of the tooth form design of gears for a wristwatch was developed. This system can perform calculation of torque transmission factor of gears, automatic drawing of tooth form drawing, and engagement simulation, and by utilizing this system the tooth form can be designed in less than one fourth of the time required by the conventional method. The characteristics of the system used to calculate the torque transmission factor of a pair of gears are summarized and the displayed results are shown. ESA

Automatic welding systems for watch circuits were developed to automate large variety small quantity production processes. The aim of the development was achieved by solving problems involving prevention of solder ball generation and development of a new heating method for components with low heat resistance, and development of a system that permits production of various watch circuits operations. As a result, it was possible to produce systems for stable soldering and switchover production of a variety of watch circuits with reduced switchover time. ESA

The power generating performance of Automatic Generating System (AGS) watches mounted with small generators designed to generate power by arms motion is investigated. Since arm movements function as the energy source, the amount of power generated when watches are worn varies for person to person. The required power generating performance also varies depending on the watch wearers. Since the power generating performance represents the balance between the generated power volume and the power volume consumed by the driving of watch mechanisms, it is essential to study both phases of increase in generating volumes and reduction of consumption volumes when attempting to improve power generating performance. The results of a simulation study of watch wearing and the results of experiments and analyses conducted for improving power generating performance are presented. ESA

A complementary metal oxide semiconductor with large scale integration was developed for an electronic minute repeater. It is equipped with the synthetic struck sound circuit to generate natural struck sound necessary for the minute repeater. This circuit consists of an envelope curve drawing circuit, frequency mixer, polyphonic mixer, and booster circuit made by using analog circuit technology. This large scale integration is a single chip microcomputer with motor drivers and input ports in addition to the synthetic struck sound circuit, and it is possible to make an electronic system of minute repeater at a very low cost in comparison with the conventional type. APPLICATION OF PIEZOELECTRIC STRESS GAUGES TO THE MEASUREMENT OF FAST-RISE-TIME MULTIMEGAMPERE ELECTRIC CURRENTS
D. L. Hanson, R. B. Spielman, J. F. Seamen, and K. W. Struve (Mission Research Corp., Albuquerque, NM.) 1993 20 p Presented at the 14th International Conference of the International Association for the Advancement of High Pressure Science and Technology, Colorado Springs, CO, 27 Jun. - 2 Jul. 1993
(Contract DE-AC04-76DP-00789)
(DE93-017625; SAND-93-0425C; CONF-930676-3) Avail: CASI HC A03/MF A01

Modeling of load behavior in Z-pinch plasma radiation sources driven by high current generators requires accurate measurement of fast-rise-time multimegampere electrical currents close to the load. Using a novel application of high pressure technology, we have demonstrated that fast-response piezoelectric stress transducers can measure such currents under conditions of extremely high current density, induced electric fields, and bremsstrahlung radiation where conventional current diagnostics fail. Large signal, nanosecond-time-resolution lithium niobate piezoelectric stress gauges are employed to directly measure the magnetic pressure B(sup 2)/2(mu)(sub 0) = (mu)(sub 0)I(sup 2)/8(pi)(sup 2)r(sup 2) generated at radius r by a current I flowing in a radial transmission line near the load of a pulsed power current source. With a current diagnostic consisting of a pure tungsten electrode on a Y-cut lithium niobate stress gauge, current densities up to 1/2(pi)cr = 78MA/m can be measured before the electrode yield strength and piezoelectric operating stress limit are exceeded. Based on this work, we have developed a compact modular current probe for use on the high current (20-25 MA) DECADE simulator being constructed for the Defense Nuclear Agency. We also describe recent work extending this measurement technique to higher current densities (125 MA/m) using a copper-sapphire electrode impedance stack on an X-cut quartz piezoelectric element. The Diagnostic Instrumentation and Analysis Laboratory (DIAL) has been actively engaged in developing and applying advanced optical diagnostic techniques and instrumentation systems to high temperature coal-fired gas streams for over a decade. DIAL's systems have been used primarily in support of the US Department of Energy's (DOE) magnetohydrodynamic (MHD) research program. One of the earliest diagnostic systems developed by DIAL was a two color pyrometer (TCP). The TCP is used to measure surface temperature and emissivity. This system has been used extensively to make measurements in support of the national MHD program. In this system, two commercial single-color pyrometers and a microprocessor system were used to form a TCP to make accurate measurements of surfaces of unknown emissivity and temperature. This paper describes an improvement in the DIAL TCP which provides for near simultaneous multipoint measurements, reduced dependence on electronic circuits, and a greatly improved data display system. Commercial two-color pyrometer systems are not suitable for our work because they do not provide for emissivity measurement. The emissivity measurement provides insight into changes in surface characteristics and is an important consideration in our work. A second and important reason for our development of this system is the need to make simultaneous measurements at widely separated points. Finally, the data measured by this system is stored on magnetic media and can be correlated with other measurements on the system, e.g. furnace, under study. DOE

HIGH SPEED 512X512 CAMERA SYSTEM
A. Conder Jul. 1992 13 p
(Contract W-7405-eng-48)
(DE93-015671; UCRL-ID-111216) Avail: CASI HC A03/MF A01

Lawrence Livermore National Laboratory has been involved in the design of high speed solid state camera systems for over a decade. The latest camera system designed by the laboratory utilizes the CCD-13 multiport 512 x 5l2 CCD array, manufactured by English Electric Valve. Simultaneous readout from each port at a 20 MHz pixel rate allows this camera system to achieve up to 500 frames per second. A first generation camera system was designed by LLNL to provide data on the CCD-13, and as proof of principle for the camera system electronics. The results of the tests involving this camera will be presented in this report. A second generation camera system has been designed which incorporates the knowledge gained from these tests, and is currently being manufactured. This system should be available for testing in September '92. DOE

DEVELOPMENTAL TESTING OF A PROTOTYPE ALL-REFLECTION MICHELSON INTERFEROMETER M.S. Thesis
Allan D. Risley, Jr. Jun. 1993 48 p
(AD-A269064) Avail: CASI HC A03/MF A01

A prototype all-reflective Michelson interferometer is tested using visible laser, sodium, and mercury light sources. The design uses an off-axis parabolic mirror for collimation, a plane diffraction grating, and two plane mirrors to divide and recombine incident light. Interference fringes were seen using the laser light source, but instrument performance with other sources was unreliable as a result of difficulties in constructing the instrument with enough mechanical precision. A method of using a full-size template to position the instrument's optical elements was discovered, and the efficacy of an image intensifier/photodiode array combination for use as a detector was verified. The feasibility of the interferometer design was verified by the observation of interference fringes using mercury 5461 A light. A practical instrument would be compact, light weight, and require no moving parts. DTIC

HIGH SPATIAL RESOLUTION, RANGE GATED, UNDERWATER IMAGING METHOD AND APPARATUS Patent Application
Edgar A. McLean, inventor (to Navy) 30 Jun. 1993 22 p
(AD-D015882; US-Patent-Appl-SN-083580) Avail: CASI HC A02/MF A01

This patent application discloses a method and apparatus for imaging objects in turbid mediums, such as water, the invention using a laser pulse, a detector of the reflected laser pulse, and a shutter on the detector. The shutter is kept closed except at the excepted return time of the laser pulse from the reflected object to be detected and identified at which time the shutter is opened to permit the detector to receive the reflected laser pulse. Typically, laser pulses with widths of about 100 to about 500 psecs are used. In addition, typical shutter times or gate width of about 100 to about 500 psecs are also used. Gate widths on the order of 120 psecs are preferred. The detector or GOI camera is shielded from spurious signals, most notably, scattered laser light from the turbid medium. DTIC

(Contract N00014-91-J-1212)
(AD-A269663) Avail: CASI HC A03

Information can be manipulated and processed by a nonlinear dynamical system. This work investigates the properties of such nonlinear optical systems based upon real-time holographic materials known as photorefractive media. Our goal is to understand how and when a dynamical system can self-organize, or learn on its own to process information in a useful way. We have demonstrated systems, for example, that can separate multiple fiber optic communication channels or learn to classify incoming images. We have discovered that such self-organizing systems will exhibit a phase transition with the information content of the input as the critical parameter. The phase transitions are analogous to those common to thermodynamic systems. In order to better provide an analytical basis of treatment of our systems we have developed various analytical tools, in particular, stability analysis tools. We have also looked at the photorefractive version of well known nonlinear dynamical problems such as the formation of hexagonal patterns in pumped photorefractive media. DTIC

General concepts widely applicable in experimental techniques are provided. Focus is on general data acquisition principles and treatment as an example of widely used techniques for different kinds of measurements: pressure measurements, infrared thermography and liquid crystal techniques; all of them can be characterized as nonintrusive. The lectures on pressure measurements deal with techniques, such as pressure sensitive paints and laser induced luminescence. The physical properties on which the techniques are based are explained and possible applications are illustrated with test cases. The two other techniques are devoted to temperature and heat transfer measurements. The physics of each is discussed in an introductory lecture on Infrared Thermography (IT) and Liquid Crystals (LC). The emphasis is placed on IT. The application domain and limitations of IT and LC are discussed and illustrated. For individual titles, see N94-18644 through N94-18654.

DATA ACQUISITION IN AERODYNAMIC RESEARCH
R. W. Ainsworth *In* VKI, Measurement Techniques 1993 78 p (For primary document see N94-18643 04-35)
Copyright Avail: CASI HC A05/MF A04

Data acquisition, related to aerodynamic flows is discussed. Typical transducers used in aerodynamic research, how they are constructed, their excitation and response through any conditioning electronics to the equipment used to record their output are discussed. Those discussed include response transducers for pressure measurement, hot wire anemometers and thin film sensors. With the rapid and continuing reduction in the cost of computing power, there is a continuing emphasis on the digital manipulation of output signals (digital signal processing) involving much use of frequency time transformations, Fourier analysis and correlation functions. The basics of all the technology encompassed in data acquisition are introduced and examples of how the technology is used at the forefront of current research in aerodynamics are given. Examples are in general confined to the field of turbomachinery. ESA

Copyright Avail: CASI HC A04/MF A04

The basic concepts and some of the more important engineering details of an optical pressure measurement, which is based on the fact that some compounds emit light when excited by a suitable light source (photoluminescence) are discussed. The intensity of the emitted light is inversely related to the partial pressure of oxygen and is of longer wavelength than the excitation light. This phenomena can be incorporated into a pressure measurement system. An oxygen quenched photoluminescent compound is mixed with an oxygen permeable binder to form a Pressure Sensitive Paint (PSP). This paint is applied to an aircraft model and excited with a proper light source. The light source must be filtered so that it emits no light in the luminescence band. A high resolution video camera views the model through a filter that removes all light except that emitted by the paint. The distribution of pressure over the model is computed from the measured distribution of light intensity; that is, the brighter a point in the image, the lower the pressure. The specification of a typical PSP system, current research in the area, and the future potential of the technique are discussed. ESA

HEAT TRANSFER QUANTITATIVE CHARACTERIZATION: PASSIVE AND ACTIVE METHODS
D. L. Balageas *In* VKI, Measurement Techniques 1993 32 p Original contains color illustrations (For primary document see N94-18643 04-35)
Copyright Avail: CASI HC A03/MF A04

Two ways of determining the convective fluxes from the nonsteady temperatures are discussed: the passive method of classical thermography, in which the heating due to convection alone is used; and the active method of stimulated thermography in which the heat transfer coefficients are found directly from the heating due to a source of radiation, which is added to the convection for very brief intervals. The various algorithms used for identification of the heat transfer coefficient are presented together with some experimental results. For heat transfer identification, monodimensional models are used in both the passive and active modes. Moreover, considering the fact that supersonic or hypersonic flows are being dealt with, it is assumed that the linearized transfer coefficient corresponding to the radiative transfers between the model and the wind tunnel wall is negligible compared with the convective transfer coefficient. ESA

THE APPLICATION OF LIQUID CRYSTAL TECHNIQUES TO DETERMINE HEAT TRANSFER RATES
G. Rau, J. Vanhalst, and T. Arts *In its* Measurement Techniques 1993 40 p (For primary document see N94-18643 04-35)
Copyright Avail: CASI HC A03/MF A04

Different methods using liquid crystals to determine surface temperature are listed. These methods depend on the unique characteristic of cholesteric and chiral nematic liquid crystals to change color with variation of temperature. An explanation of 'color' is given. There is a direct relation between the temperature and the maximum intensity wavelength scattered by the liquid crystal layer. This expression leads directly to the spectral distribution of light and the basic optical properties of liquid crystals which are reviewed. Early methods used the human eye as measurement instrument, while later developed methods went over to cameras taking color pictures and video recordings. It is clear that neither photographic nor video cameras were developed for making accurate heat transfer measurements. They try to reproduce the human color perception as close as possible, and for their application in heat transfer measurement chains basic considerations about their recording technique have to be made. Other color influencing parameters which can deteriorate the measurements are considered. A narrow bandpass filter method is described. The application to a practical case and the difficulties in calculating the heat transfer coefficients are discussed. ESA

EFFICIENT SIMULATION OF DEDS BY MEANS OF STANDARD CLOCK TECHNIQUES: QUEUEING AND INTEGRATED RADIO NETWORK EXAMPLES Interim Report, Jun. 1992 - Jun. 1993
Jeffrey E. Wieselthier, Craig M. Barnhart, and Anthony Ephremides 7 Sep. 1993 57 p
(AD-A269878; NRL/MR/5521-93-7392) Avail: CASI HC A04/MF A01

We discuss the application of the Standard Clock (SC) approach to the simulation of several examples of discrete event dynamic systems (DEDS), and demonstrate the improved efficiency that can be achieved by using this approach. In SC simulation, a common clock (event time, event type) sequence is used by a large number of simulations running in parallel, thereby resulting in a significant decrease in the most costly aspect of the simulation process, namely the generation of events. In studies of the M/M/1/K queue, we quantify the time spent in the various aspects of the simulation, and compare predicted performance improvement with that which is actually measured. This approach scales well when applied to larger problems, including queueing networks and multihop radio networks. We develop a SC simulation model for a multihop, integrated voice/data radio network, and demonstrate its use for the determination of admission control policies. Ordinal optimization techniques are shown to provide good, although not optimal, control policies on the basis of short simulation runs. DTIC

PHOTODETECTOR ARRAY HAVING HIGH PIXEL DENSITY Patent Application
Carmen I. Huber, inventor (to Navy), Tito E. Huber, inventor (to Navy), Tak-Kin Chu, inventor (to Navy), and Nicholas Caviris, inventor (to Navy) 18 Jun. 1993 10 p
(AD-D015859; US-Patent-Appl-SN-077806) Avail: CASI HC A02/MF A01

Photoconductive semiconductor material is injected into narrow and closely spaced cylindrical channels in an insulating matrix plate to form pixel elements of a high resolution photodetector array. A transparent conductive layer is deposited on one surface of the photoconductor array while light reflecting pads are formed on the elements at the opposite surface. Subsequently, a layer of light modulating material and a transparent conductive layer are deposited on the opposite surface to obtain a high resolution spatial light modulator. DTIC

AN RS-170 TO 700 FRAME PER SECOND CCD CAMERA
K. L. Albright, N. S. P. King, G. J. Yates, T. E. McDonald, and B. T. Turko 1993 9 p Presented at the Annual Meeting of the Society of Photo-Optical Instrumentation Engineers, San Diego, CA, 11-16 Jul. 1993
(Contract W-7405-eng-36)
(DE93-018367; LA-UR-93-2544; CONF-930722-17) Avail: CASI HC A02/MF A01

A versatile new camera, the Los Alamos National Laboratory (LANL) model GY6, is described. It operates at a wide variety of frame rates, from RS-170 to 700 frames per second. The camera operates as an NTSC compatible black and white camera when operating at RS-170 rates. When used for variable high-frame rates, a simple substitution is made of the RS-170 sync/clock generator circuit card with a high speed emitter-coupled logic (ECL) circuit card. DOE

CONVERSION OF ADC PULSE HEIGHTS INTO MIP UNITS: NUMASS TEST DATA, SEPTEMBER 1991
Q.-P. Zhang Apr. 1993 21 p
(USIP-93-03; ETN-93-94851) Avail: CASI HC A03/MF A01

Analog to Digital Converter (ADC) calibration is an important part of the data analysis in particle physics. Data analysis of ADC pulse heights is based on a physical unit which is called MIP (most probable energy loss of Minimum Ionization Particles). The ADC calibration work for the Sep. 1991 NUMASS test data, which were produced at Centre d'Etudes et Recherche Nucleaire (CERN) at the Super Proton Synchrotron (SPS) facility is described. The NUMASS (renamed to NEWMASS) experiment was a proposal to search for neutral strange matter in heavy ion collisions. The Vavilov function is used to fit the energy loss distributions of minimum ionizing particles traversing the time of flight scintillators embedded in the uranium scintillator calorimeter. It is assumed that the energy loss distribution is the same for identical scintillators and the value at the peak of these distributions is used. ESA

ASPECTS OF THE CALIBRATION AND PROCESSING OF THE CRRES FLUXGATE MAGNETOMETER DATA Scientific Report No. 1
W. J. McNeil 21 May 1993 62 p
(Contract F19628-93-C-0023)
(AD-A270127; RXR-930501; PL-TR-93-2124; AD-E201614) Avail: CASI HC A04/MF A01

The report describes algorithms for on-orbit calibration and processing of the Fluxgate Magnetometer data from the Combined Release and Radiation Effects Satellite. The calibration problem is parameterized in a completely general treatment in terms of instrument alignment and magnetometer offsets and gains. Fits to the data from the spinning satellite are used to derive all but two of the parameters needed for despinning. Data taken during precession maneuvers and attitude data is used to derive these remaining two. The report includes a discussion of anomalies in the instrument and includes a description of the data products. DTIC

OPERATIONAL PARAMETERS OF AN OPTO-ELECTRONIC NEURAL NETWORK EMPLOYING FIXED PLANAR HOLOGRAPHIC INTERCONNECTS
P. E. Keller and A. F. Gmitro (Arizona Univ., Tucson.) Jul. 1993 5 p
Presented at the World Congress on Neural Networks, Portland, OR, 11-15 Jul. 1993
(Contract DE-AC06-76RL-01830)
(DE93-018795; PNL-SA-21852; CONF-930741-4) Avail: CASI HC A01/MF A01

A prototype neutral network system of multifaceted, planar interconnection holograms and opto-electronic neurons is analyzed. This analysis shows that a hologram fabricated with electron-beam lithography has the capacity to connect 6700 neuron outputs to 6700 neuron inputs, and that, the encoded synaptic weights have a precision of approximately 5 bits. Higher interconnection densities can be achieved by accepting a lower synaptic weight accuracy. For systems employing laser diodes at the outputs of the neurons, processing rates in the range of 45 to 720 trillion connections per second can potentially be achieved. DOE

RADIATION INDUCED DARKENING OF THE OPTICAL ELEMENTS IN THE STARTRACKER CAMERA
R. H. White and G. R. Wirtenson Mar. 1993 29 p
(Contract W-7405-eng-48)
(DE93-018907; UCRL-ID-113713) Avail: CASI HC A03/MF A01

Optical glass flats that closely simulate the elements used in the Startracker lens designs were exposed to doses of ionizing radiation ranging from 0.44 to 1300 krad. Photometer traces determined the transmittance of the samples as a function of both wavelength and dose for wavelengths in the range 300 to 1200 nm. Cerium stabilized glasses used in the radiation stabilized Startracker system showed only a small amount of darkening for doses up to and exceeding 1 Mrad. Glasses used in the unstabilized Startracker design showed significant darkening to visible and ultra-violet spectra for doses as low as 5 krad. Plots of transmittance versus wavelength for various doses are given for each of the Startracker optical elements. Radiation induced absorption parameters that determine the radiation induced absorption coefficient are tabulated and plotted versus wavelength. DOE

INTEGRATED TEST PLAN FOR THE DEMONSTRATION OF A COMMERCIAL FOURIER TRANSFORM INFRARED INSTRUMENT
K. J. Koegler 1993 8 p
(Contract DE-AC06-87RL-10930)
(DE93-018518; WHC-SD-EN-TP-030) Avail: CASI HC A02/MF A01

This integrated test plan describes the use of a commercial Fourier Transform Infrared instrument for measuring carbon tetrachloride concentrations. The Fourier Transform Infrared will measure CCL4 concentrations in a line of sight path average mode in mass per cubic meter as a function of time. Demonstration of this device will be conducted at the 200 West Area Carbon Tetrachloride Expedited Response Action (ERA) site. The goal of this test is to demonstrate the usefulness of a long path Fourier Transform Infrared instrument in determining CCL4 fluxes from the soil in the 200 area adjacent to disposal cribs where high soil fluxes are believed to exist. The instrument will be set up such that it can have a clear line of site path to its reflector and this line of site will be as near to the Z-9 fence as possible and have a path length as long as possible. DOE

NOVEL MASS SPECTROMETRIC INSTRUMENT FOR GASEOUS AND PARTICULATE CHARACTERIZATION AND MONITORING
M. J. Coggiola Apr. 1993 15 p
(Contract DE-AC21-92MC-29116)
(DE93-019992; DOE/MC-29116/3406) Avail: CASI HC A03/MF A01

SRI International will develop a unique new instrument that will be capable of providing real-time (less than one minute), quantitative, chemical characterization of gaseous and particulate pollutants generated from DOE waste cleanup activities. The instrument will be capable of detecting and identifying volatile organic compounds, polynuclear aromatic hydrocarbons, heavy metals, and transuranic species released during waste cleanup activities. The instrument will be unique in its ability to detect and quantify in real-time these diverse pollutants in both vapor and particulate form. The instrument to be developed under this program will consist of several major components: an isokinetic sampler capable of operating over a wide range of temperatures (up to 500 K) and flow rates; a high pressure to low pressure transition and sampling region that efficiently separates particles from vapor-phase components for separate, parallel analyses; two small mass spectrometers, one optimized for organic analysis using a unique field ionization source and one optimized for particulate characterization using thermal pyrolysis and electron-impact ionization (EI); and a powerful personal computer for control and data acquisition. DOE

EXPERIMENTS AND ANALYSIS OF LATERAL PIEZORESISTANCE GAUGES
M. K. W. Wong 1993 5 p Presented at the 14th International Conference of the International Association for the Advancement of High Pressure Science and Technology, Colorado Springs, CO, 27 Jun. - 2 Jul. 1993
(Contract DE-AC04-76DP-00789)
(DE93-017874; SAND-93-0882C; CONF-930676-13) Avail: CASI HC A01/MF A01

The response of lateral piezoresistance gauges to shock wave uniaxial strain loading has been examined in a combined experimental and calculational effort. Plate impact experiments provided lateral gauge data which were analyzed using quasi-static and dynamic inclusion analyses. Experimental data showed that the response of the lateral gauge output depended upon the matrix material and gauge emplacement method. The calculations indicated that these differences were due to complex gauge-matrix interactions. These interactions were influenced by the stress and strain distributions in and around the gauge, plasticity effects, properties of the gauge and matrix materials, and emplacement conditions. DOE

SUBSTRATE TEMPERATURE MEASUREMENT AND CONTROL DURING THERMAL PLASMA CVD
Q. D. Zhuang, H. Guo, Q. Y. Han, J. V. R. Heberlein, and E. Pfender 1993 29 p
(Contract DE-FG02-85ER-13433)
(DE93-040305; DOE/ER-13433/5) Avail: CASI HC A03/MF A01

A technique is proposed for substrate temperature control, with emphasis on temperature uniformity across substrate. The technique includes a substrate holder design employing non-uniform water cooling and a means of substrate attachment featured by controlled thermal contact resistance for a given heat flux distribution from the plasma. The technique was applied to deposit diamond films over a 5 cm diameter area in a DC thermal plasma reactor, and proved adequate. Performance of single-color (0.655 (mu)m) and two-color (2.1 and 2.4 (mu)m) pyrometers were evaluated against DC thermal plasma radiation. It was found that both line and continuum emission of plasma jets caused large errors in temperature measurement of the single-color pyrometer. The two-color pyrometer, however, is shown to be less sensitive to the plasma radiation. The way the substrate temperature was controlled and monitored in this study is in general applicable to other TPCVD processes where intense local heating and a bright plasma background exist. DOE

HIGH TEMPERATURE STRAIN MEASUREMENT WITH A RESISTANCE STRAIN GAGE Final Report
Jih-Fen Lei, Ed Fichtel (Pratt and Whitney Aircraft Group, West Palm Beach, FL.), and Amos McDaniel (Pratt and Whitney Aircraft Group, West Palm Beach, FL.) Dec. 1993 7 p Presented at the SEM Fall Conference and Exhibit: Structural Testing Technology at High Temperature-2, Ojai, CA, 8-10 Nov. 1993
(Contract NAS3-25266; RTOP 505-62-5B)
(NASA-CR-194441; E-8300; NAS 1.26:194441) Avail: CASI HC A02/MF A01

A PdCr based electrical resistance strain gage was demonstrated in the laboratory to be a viable sensor candidate for static strain measurement at high temperatures. However, difficulties were encountered while transferring the sensor to field applications. This paper is therefore prepared for recognition and resolution of the problems likely to be encountered with PdCr strain gages in field applications. Errors caused by the measurement system, installation technique and lead wire attachment are discussed. The limitations and some considerations related to the temperature compensation technique used for this gage are also addressed. Author (revised)

CONTRIBUTION TO THE TRIBOLOGICAL STUDY OF MAGNETIC-TAPE HEAD CONTACT Ph.D. Thesis [CONTRIBUTION A L'ETUDE TRIBOLOGIQUE DU CONTACT TETE MAGNETIQUE-BANDE]
Nicolas Blanchard 1992 159 p In FRENCH Original contains color illustrations
(ECL-92-57; ETN-93-94601) Avail: CASI HC A08/MF A02

A study which investigated the possibility of protecting magnetic tape heads from wear with a thin layer of hard material is reported. The material chosen was hydrogenated amorphous carbon for its hardness and because it is possible to deposit very thin layers in the cold. In order to understand better the wear, the interface between the magnetic tape and a solid was studied. The constraints of magnetic recording are exposed, and the rubbing conditions in a helicoidal recorder are described using simple models. The interaction between the head and the tape is examined, and the influence on the contact of Van De Waals forces and of the damping is estimated. The origin of wear is then looked into. The interaction between the tape and the head through the intermediate of the pigment is modeled integrating the tape deformations which leads to a definition of a new contact plasticity index which takes account of the appearance of wearing. SIMULATION OF THE BEHAVIOR OF MICRO-ELECTRONIC CAPACITIVE PRESSURE SENSORS Ph.D. Thesis - Inst. National des Sciences Appliquees, Toulouse [SIMULATION DU COMPORTEMENT DES CAPTEURS DE PRESSION CAPACITIFS MICROELECTRONIQUES]
Pierre-Nicolas Ratier 1993 144 p In FRENCH Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(LAAS-93190; ETN-93-95014) Avail: CASI HC A07

The numerical simulation of the response of microelectronic capacitive pressure sensors is studied. Response curves for classical capacitive sensors are provided. Modifications brought about by the superposition of an electrostatic pressure on a constant pressure are examined and sensors of more complex structures are analyzed. The case where the sensor deformable armature has non-uniform thickness is treated. The influence of the variation of thickness upon the sensor response is shown. The analysis of polygonal shaped sensors is also presented and followed by two applications aimed at extending the pressure range. The behavior of sensors when subjected to contact is studied: the resulting curves are obtained with significant improvements. The modeling of capacitive sensors by using the nonlinear plate theory of von Karman is proposed. In fact the use of von Karman theory becomes unavoidable as soon as the plate deflection is of the order of its thickness. Therefore, the models employed involve linear and nonlinear equations and systems of partial differential equations in two dimensional spatial domains. The discretization of these equations is carried out by the general method of finite differences. To solve the resulting equations iterative methods such as the conjugate gradient algorithm and the Newton-Raphson algorithm are used. An interactive software for the discretization of stationary linear and nonlinear partial differential equations was developed. An outline of a methodology for curvilinear finite difference method and its application to the study of flexed plates are provided. ESA

A feasibility study of a possible setup for measuring the external ballistic speed of large caliber projectiles was performed leading to a conceptual design. The measuring system uses semiconductor optoelectrical detectors. These detectors are shown to have a lower signal to noise ratio than photomultipliers used in separate photocell units. The detection correlation method and the measuring system are described. The most important computer programs are explained. The optimization of the signal to noise ratio of the detection system and the application of detection correlation techniques provide a high sensitivity of the velocity measuring system. ESA

MEASURING EMITTANCE USING BEAM POSITION MONITORS
S. Russell and B. Carlsten 1993 8 p Presented at the International Particle Accelerator Conference, Washington, DC, 17-20 May 1993
(Contract W-7405-eng-36)
(DE93-014470; LA-UR-93-1880; CONF-930511-48) Avail: CASI HC A02/MF A01

The Los Alamos Advanced Free Electron Laser uses a high charge (greater than 1 nC), low emittance (normalized rms emittance less than 5(pi) mm mrad) photoinjector driven accelerator. The high brightness achieved is due, in large part, to the rapid acceleration of the electrons to relativistic velocities. As a result, the beam does not have time to thermalize its distribution and its universe profile is, in general, non-Gaussian. This, coupled with the very high brightness, makes it difficult to measure the transverse emittance. Techniques used must be able to withstand the rigors of very intense electron beams and not be reliant on Gaussian assumptions. Beam position monitors are ideal for this. They are not susceptible to beam damage, and it has been shown previously that they can be used to measure the transverse emittance of a beam with a Gaussian profile. However, this Gaussian restriction is not necessary and, in fact, a transverse emittance measurement using beam position monitors is independent of the beam's distribution. DOE

THE COPPER-PUMPED DYE LASER SYSTEM AT LAWRENCE LIVERMORE NATIONAL LABORATORY
R. P. Hackel and B. E. Warner 12 Jan. 1993 13 p Presented at the OE/LASE 1993: International Society for Optical Engineering (SPIE) Conference, Los Angeles, CA, 16-23 Jan. 1993
(Contract W-7405-eng-48)
(DE93-014429; UCRL-JC-111378; CONF-930159-35) Avail: CASI HC A03/MF A01

The Atomic Vapor Isotope Separation (AVLIS) Program has developed a high-average-power, pulsed, tunable, visible laser system. Testing of this hardware is in progress at industrial scales. The copper-dye Laser system is prototypical of a basic module of a uranium-AVLIS plant. The laser demonstration facility (LDF) system consists of copper vapor lasers arranged in oscillator-amplifier chains providing optical pump power to dye-laser master oscillator-power-amplifier chains. This system is capable of thousands of watts (average) tunable between 550 and 650 mm. The copper laser system consists of 12 chains operating continuously. The copper lasers operate at nominally 4.4 kHz, with 50 ns pulse widths and produce 20 W at near the diffraction limit from oscillators and greater than 250 W from each amplifier. Chains consist of an oscillator and three amplifiers and produce greater than 750 W average, with availabilities greater than 95% (i.e. greater than 8300 h/y). The total copper laser system power averages approximately 9000 W and has operated at over 10,000 W for extended intervals. The 12 copper laser beams are multiplexed and delivered to the dye laser system where they pump multiple dye laser chains. Each dye chain consists of a master oscillator and three or four power amplifiers. The master oscillator operates at nominally 100 mW with a 50 MHz single mode bandwidth. Sustained dye chain powers are up to 1400 W with dye conversion efficiency greater than 50%, ASE content less than 5%, and wavefront quality correctable to less than (lambda)/10 RMS, using deformable mirrors. The dye laser system is capable of repetition rates which are multiples of 4.4 kHz, up to 26 kHz. DOE

Two versions of the 'Phase-Step Mirror' (PSM), a novel optical component that prevents the formation of sidebands in a Free-Electron Laser (FEL) were tested on the Los Alamos National Laboratory (LANL) APEX FEL. Sideband suppression and frequency control with high extraction efficiency and single line, transform limited operation were demonstrated. The results of our LANL experiments and computer simulations showed that for very high gain applications, the first-order sideband is completely suppressed, but the laser gain is so strong that on about pass 300 the sideband at the second-order or next free spectral range of the PSM appears. This second-order sideband may be suppressed by designing a PSM with grooves having two alternating depths, one chosen to suppress the first-order sideband, and the other, the second-order sideband. DOE

SAFETY APPROACHES FOR HIGH POWER MODULAR LASER OPERATION
R. T. Handren Mar. 1993 6 p Presented at the International Laser Safety Conference on Non-Beam Hazards, Cincinnati, OH, 1-4 Dec. 1992
(Contract W-7405-eng-48)
(DE93-017213; UCRL-JC-111934; CONF-921233-3) Avail: CASI HC A02/MF A01

Approximately 20 years ago, a program was initiated at the Lawrence Livermore National Laboratory (LLNL) to study the feasibility of using lasers to separate isotopes of uranium and other materials. Of particular interest was the development of a uranium enrichment method for the production of commercial nuclear power reactor fuel to replace current more expensive methods. The Uranium Atomic Vapor Laser Isotope Separation (U-AVLIS) Program progressed to the point where a plant-scale facility to demonstrate commercial feasibility was built and is being tested. The U-AVLIS Program uses copper vapor lasers which pump frequency selective dye lasers to photoionize uranium vapor produced by an electron beam. The selectively ionized isotopes are electrostatically collected. The copper lasers are arranged in oscillator/amplifier chains. The current configuration consists of 12 chains, each with a nominal output of 800 W for a system output in excess of 9 kW. The system requirements are for continuous operation (24 h a day, 7 days a week) and high availability. To meet these requirements, the lasers are designed in a modular form allowing for rapid change-out of the lasers requiring maintenance. Since beginning operation in early 1985, the copper lasers have accumulated over 2 million unit hours at a greater than 90% availability. The dye laser system provides approximately 2.5 kW average power in the visible wavelength range. This large-scale laser system has many safety considerations, including high-power laser beams, high voltage, and large quantities (approximately 3000 gal) of ethanol dye solutions. The Laboratory's safety policy requires that safety controls be designed into any process, equipment, or apparatus in the form of engineering controls. Administrative controls further reduce the risk to an acceptable level. Selected examples of engineering and administrative controls currently being used in the U-AVLIS Program are described. DOE

CO2 LASER WITH MODULATED LOSSES: THEORETICAL MODELS AND EXPERIMENTS IN THE CHAOTIC REGIME
C. L. PandoL, R. Meucci (Istituto Nazionale di Ottica, Florence, Italy.), M. Ciofini (Istituto Nazionale di Ottica, Florence, Italy.), and F. T. Arecchi (Istituto Nazionale di Ottica, Florence, Italy.) Apr. 1993 33 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-624901; IC-93/62) Avail: CASI HC A03 (US Sales Only)

We compare two different theoretical models for a CO2 laser, namely the two-and four-level model, and show that the second one traces with much better accuracy the experimental behavior in the case of a chaotic dynamics due to time modulation of the cavity losses. Even though the two-level model provides a qualitative explanation of the chaotic dynamics, only the four-level one assures a quantitative fitting. We also show that, at the onset of chaos, the chaotic dynamics is low dimensional and can be described in terms of a noninvertible unidimensional map. DOE

OBSERVATIONS OF MeV ELECTRONS AND SCATTERED LIGHT FROM INTENSE, SUBPICOSECOND LASER-PLASMA INTERACTIONS
C. Darrow, S. Lane, D. Klem, and M. D. Perry 17 Feb. 1993 6 p Presented at the OE/LASE 1993: International Society for Optical Engineering (SPIE) Conference, Los Angeles, CA, 16-23 Jan. 1993
(Contract W-7405-eng-48)
(DE93-017153; UCRL-JC-111151; CONF-930159-47) Avail: CASI HC A02/MF A01

In this paper the authors present work in progress in their experimental investigation of the coupling of intense, subpicosecond laser pulses with plasmas performed on solid targets. (This situation is to be contrasted with the interaction of intense laser fields with solid-density matter. A subject which has generated considerable interest in the last several years.) The characterization of the energy distribution of energetic electrons which escape a solid target irradiated by an intense laser is discussed. The authors have also performed experiments to study the excitation of parametric instabilities near the quarter-critical layer and second-harmonic generation near the critical layer in the plasma. They discuss some preliminary scattered light spectroscopy measurements. DOE

DESIGNS FOR OPTICAL COMPONENTS RELATED TO THE LOS ALAMOS FREE-ELECTRON LASER
Donald A. Byrd and S. C. Bender 1993 12 p Presented at the Annual Meeting of the Society of Photo-Optical Instrumentation Engineers, San Diego, CA, 11-16 Jul. 1993
(Contract W-7405-eng-36)
(DE93-016617; LA-UR-93-2136; CONF-930722-5) Avail: CASI HC A03/MF A01

Several optomechanical tasks for the Los Alamos National Laboratory's (LANL) Free-Electron Laser (FEL) were set by the envisioned project goals as early as 1988. Unfortunately, the FEL project has been set aside due to funding constraints. The tasks reported here required extensive modeling for final adaptability into the FEL environment. The systems to be described are best identified as a Brewster attenuation device, an optical mode relay lens system, a spectral harmonics band-filtering system, a 25-nm micropulse spectrometer system, a 12.5-nm micropulse spectrometer system, a 0.6-nm micropulse spectrometer system, and a reflective mode profile rotator. The Brewster attenuation device was successfully used inside the FEL resonator. The optical mode relay lens system, spectral harmonics band filtering system, and reflective mode profile rotator were completed but never used. The 25-nm micropulse spectrometer was optically and mechanically completed, but the detector electronics were never finished. The 12.5- and 0.6-nm micropulse spectrometers were never assembled, due to hardware that was common to the 25-nm system. These systems will be described in the order listed above. The nominal wavelength of operation for the listed systems is 3.0 micron, except for the harmonics filtering which works on the subharmonics of 3.0 micron. All of these systems were operated remotely due to the harsh radioactive/x-ray optical environment during FEL operation. DOE

X-RAY LASER OSCILLATOR-AMPLIFIER EXPERIMENTS
G. M. Shimkaveg, M. R. Carter, B. K. F. Young, R. S. Walling, A. L. Osterheld, J. E. Trebes, R. A. London, R. P. Ratowsky, R. E. Stewart, and R. S. Craxton (Rochester Univ., NY.) 19 Mar. 1993 8 p Presented at the 1992 International Conference on Lasers, Houston, TX, 7-11 Dec. 1992 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract W-7405-eng-48)
(DE93-017165; UCRL-JC-110927; CONF-921256-6) Avail: CASI HC A02

We present results from experiments directed toward increasing the degree of transverse coherence in x-ray laser beams. We have concentrated on the neon-like yttrium (Z=39) collisionally-pumped x-ray laser as the test system for these studies because of its unique combination of brightness, monochromaticity, and high-reflectivity optics availability. Attempts at improving laser performance using proximate feedback optics failed. Modest success has been found to date in "double foil" experiments, involving two x-ray lasers spatially separated by 29 cm and shot sequentially in an 'oscillator-amplifier' configuration. DOE

THREE-DIMENSIONAL SIMULATION ANALYSIS OF THE FIRST SECTIONS OF A STANDING-WAVE FREE-ELECTRON LASER TWO-BEAM ACCELERATOR
Changbiao Wang and A. M. Sessler May 1993 3 p Presented at the International Particle Accelerator Conference, Washington, DC, 17-20 May 1993
(Contract DE-AC03-76SF-00098)
(DE93-016977; LBL-33256; CONF-930511-228) Avail: CASI HC A01/MF A01

A 3-D, time-dependent code is used to simulate an array of standing-wave free-electron lasers (SWFEL's) in the two-beam accelerator. It is shown that for an array of SWFEL's with 9 cavities and a 100.6-ns, 0.5-kA, 7.98-MeV electron beam prebunched at 17.1 GHz, an averaged energy output of 14.7J/m can be obtained with a fluctuation of less than 11%. PULSED LASER FOR TESTING SILICON STRIP DETECTORS
M. Vaz, S. Cihangir, and P. Rapidis Jul. 1993 16 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-AC02-76CH-03000)
(DE93-017816; FNAL-TM-1849) Avail: CASI HC A03

This DO Note describes a pulsed LASER setup for testing silicon strip detectors at the Silicon Detector Facility (SiDet) of Fermilab supporting the related projects and, in particular, the DO Silicon Tracker Upgrade. It will be used in the measurements of the efficiency of individual strips and their coupling. The LASER wavelength is 1060 nm, at which the absorption length in silicon is about 2 mm. The LASER setup is capable of producing light pulses with rise time of less than 1 ns, allowing the measurement of charge pulse shaping at individual strips and their capacitive couplings. Due to the high power output of the LASER, safety considerations are included. Also discussed are precautions for the safety of the LASER itself, and how to limit the light to an area smaller than 50 micrometers of diameter. DOE

HOMOCLINIC CRISES IN A MODEL FOR THE CO2 LASER
C. L. PandoL and H. A. Cerdeira Apr. 1993 18 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-624900; IC-93/61) Avail: CASI HC A03 (US Sales Only)

We show that the four-level model for the CO2 laser with modulated losses predicts a critical exponent close to 1/2 for the characteristic times in two homoclinic crises. In the five-dimensional Poincare map corresponding to this model, a sequential horseshoe formation due to the period three unstable orbit takes place after a region of multistability. DOE

DYNAMICS OF SHORT-PULSE EXCITATION, IONIZATION AND HARMONIC CONVERSION
K. C. Kulander, K. J. Schafer, and J. L. Krause Jan. 1993 16 p Presented at the NATO Workshop, Han-Sur-Lesse, Belgium, 8-14 Jan. 1993
(Contract W-7405-eng-48)
(DE93-017220; UCRL-JC-112686; CONF-9301119-1) Avail: CASI HC A03/MF A01

In this paper we discuss recent calculations for xenon in pulsed laser fields which illustrate the multiphoton processes. In these calculations we have employed a single-active-electron (SAE) model which explicitly follows the separate time evolution of each of the valence electrons in the frozen, mean-field of the remaining, unexcited electrons, the nucleus and the laser field. This model works well for the rare gas atoms, at least partially because the neglected double or higher excitations involve states well above the ionization threshold. In the next section we give a brief description of the SAE model, emphasizing in particular the development of ion-core specific effective potentials. We present ionization, photoelectron and photoemission rates for xenon at 1.06 (mu)m and compare them to recent experimental results in the third section. We show that harmonics and ATI although related are not identical. The electron energy distributions do not show the cutoff observed in harmonics. After describing the quantum mechanical results and comparing them to recent experiments, we will present a simple two-step, quasi-classical model which explains these differences and which gives a more complete understanding of the dynamics of non-perturbative excitation. DOE

A SUPERCONDUCTING SHORT PERIOD UNDULATOR FOR A HARMONIC GENERATION FEL EXPERIMENT
G. Ingold, L. Solomon, I. Ben-Zvi, S. Krinsky, D. Li, D. Lynch, J. Sheehan, M. Woodle, X. Z. Qiu, and L. H. Yu et al 1993 4 p Presented at the International Particle Accelerator Conference, Washington, DC, 17-20 May 1993
(Contract DE-AC02-76CH-00016)
(DE93-017581; BNL-49144; CONF-930511-250) Avail: CASI HC A01/MF A01

A three stage superconducting (SC) undulator for a high gain harmonic generation (HGE) FEL experiment in the infrared is under construction at the NSLS in collaboration with Grumman Corporation. A novel undulator technology suitable for short period (6-40mm) undulators will be employed for all three stages, the modulator, the dispersive section and the radiator. The undulator triples the frequency of a 10.4(mu)m CO2 seed laser. So far a 27 period (one third of the final radiator) prototype radiator has been designed, built and tested. DOE

LASER INDUCED DAMAGE TESTING: EQUIPMENT AND TECHNIQUES
G. L. Morelli Jul. 1993 32 p
(Contract DE-AC04-76DP-00613)
(DE93-017143; KCP-613-5080) Avail: CASI HC A03/MF A01

A laser damage test station was designed and built at the AlliedSignal Inc., Kansas City Division (KCD). The purpose of this effort was to establish the capability for testing polished optical fibers for high energy laser transmission to support the Direct Optical Initiation (DOI), optical firing-set program. A single shot, conditioned threshold type laser damage test was implemented. A flashlamp pumped, multimode, Q-switched, Nd:YAG laser was utilized as the test source. The test laser's operational parameters were extensively characterized. The pulse width, beam divergence, and polarization state of the laser were all held constant throughout the tests. A single plano-convex lens was utilized to focus the laser beam energy into the optical fibers. A focusing geometry was utilized which avoided bulk damage and minimized damage at the fiber's core/cladding interface. A special holding fixture was fabricated, which minimized the mechanical stresses on the fiber during testing. Several uncoated, step-index, multimode, optical fibers were damage tested to verify the functionality of the test station. The fibers all had a 400 micron diameter core of pure fused silica, a 440 micron diameter fluorine doped fused silica cladding, and a 15 micron thick polyimide buffer layer. The fibers were tested up to a fluence level greater than 55.7 J/cm(exp 2) or until damage was observed. Cleaning, inspection, and testing procedures were developed and documented. DOE

ELECTRICALLY EXCITED CO-LASERS WITH GAS DYNAMIC COOLING Ph.D. Thesis - Stuttgart Univ. [ELEKTRISCH ANGEREGTE CO-LASER MIT GASDYNAMISCHER KUEHLUNG]
Hartwig vonBuelow Jan. 1993 157 p In GERMAN
(DLR-FB-93-08; ETN-93-94877) Avail: CASI HC A08/MF A02

Scaling laws for gas dynamically cooled CO lasers, which are excited by an electric discharge in the subsonic flow, are derived from the results of experimental investigations. These experiments concern the excitation of the laser-gas mixture by a DC or RF discharge, the gas dynamic cooling of the excited gas in a supersonic nozzle, the extraction of laser power in the supersonic gas flow, and the laser beam quality. Based on the experimental results, gas dynamically cooled CO lasers with a closed gas cycle were developed, using either a DC or RF excitation technique. The performance of these laser systems were investigated and proposals were given for lasers in the multi kW range. Using the results of a literature survey and a system analysis, a comparison was for CO lasers with different cooling techniques. ESA

ULTRA-SHALLOW BOX-LIKE PROFILES FABRICATED BY PULSED UV-LASER DOPING PROCESS
E. Ishida, T. W. Sigmon (Stanford Univ., CA.), and K. H. Weiner 23 Mar. 1993 9 p Presented at the 2nd International Workshop on the Measurement and Characterization of Ultra-Shallow Doping Profiles in Semiconductors, Triangle Park, NC, 23-25 Mar. 1993
(Contract W-7405-eng-48)
(DE93-017221; UCRL-JC-113469; CONF-9303196-1) Avail: CASI HC A02/MF A01

Ultra-shallow, box-like impurity profiles are produced using gas immersion laser doping (GILD) and then analyzed by spreading resistance profilometry (SRP) and secondary ion mass spectrometry (SIMS) to determine the impurity distribution. At high concentrations, the profiles obtained by SRP exhibit the expected box-like shape over the entire range of junction depths: The measured concentration within the junction region is uniform while the dopant gradient at the junction exceeds 0.5 decades/nm. In comparison, the same profiles analyzed by SIMS show a broader transition at the metallurgical junction. Caused by knock-ons and ion mixing during the sputtering process, this inaccuracy is reduced, but not eliminated by lowering the acceleration energy of the primary Cs(+) ion beam. At lower concentrations (less than 10(exp 19)/cm(exp 3)), profiles analyzed by SRP exhibit shallower junctions than expected. Electrical measurements of diodes and Hall structures show that high-quality, ultra-shallow n(sup +)p, np and pn are fabricated with good dose control using GILD. For complete characterization of GILD, accurate measurement of both chemical and electrically-active dopant profiles are required. At present, neither SIMS nor SRP provides an entirely accurate impurity profile. DOE

LASER MATERIALS PROCESSING APPLICATIONS AT LAWRENCE LIVERMORE NATIONAL LABORATORY
R. S. Hargrove, E. P. Dragon, R. P. Hackel, D. D. Kautz, and B. E. Warner 25 Feb. 1993 12 p Presented at the OE/LASE 1993: International SPIE Conference, Los Angeles, CA, 16-23 Jan. 1993
(Contract W-7405-eng-48)
(DE93-017976; UCRL-JC-113221; CONF-930159-52) Avail: CASI HC A03/MF A01

High power and high radiance laser technologies developed at Lawrence Livermore National Laboratory (LLNL) such as copper-vapor lasers, solid-state slab lasers, dye lasers, harmonic wavelength conversion of these lasers, and fiber optic delivery systems show great promise for material processing tasks. Evaluation of models suggests significant potential for tenfold increases in welding, cutting, and drilling performance, as well as capability for applications in emerging technologies such as micromachining, surface treatment, and stereolithography. The goals of this program are to develop low-cost, reliable and maintainable industrial laser systems. Chains of copper lasers currently operate at more than 1.5 kW output and achieve mean time between failures of more than 1,000 hours. The beam quality of copper vapor lasers is approximately three times the diffraction limit. Dye lasers have near diffraction limited beam quality at greater than 1.0 kW. diode laser pumped, Nd:YAG slab lasers are also being developed at LLNL. Current designs achieve powers of greater than 1.0 kW and projected beam quality is in the two to five times diffraction limited range. Results from cutting and drilling studies in titanium and stainless steel alloys show that cuts and holes with extremely fine features can be made with dye and copper-vapor lasers. High radiance beams produce low distortion and small heat-affected zones. The authors have accomplished very high aspect ratio holes in drilling tests (greater than 60:1) and features with micron scale (5-50 (mu)m) sizes. Other, traditionally more difficult, materials such as copper, aluminum and ceramics will soon be studied in detail. DOE

DEVELOPMENT OF SHORT PULSE SOFT X RAY LASERS
L. B. DaSilva, B. J. MacGowan, J. A. Koch, S. Mrowka, D. L. Matthews, D. Eder, and R. London Feb. 1993 7 p Presented at the OE/LASE 1993 International Society for Optical Engineering (SPIE) Conference, Los Angeles, CA, 16-23 Jan. 1993
(Contract W-7405-eng-48)
(DE93-017150; UCRL-JC-113179; CONF-930159-48) Avail: CASI HC A02/MF A01

X-ray lasers with pulse durations shorter than 20 ps allow the possibility of imaging laser produced plasmas with micron resolution. In addition, the high peak brightness of these new sources will allow us to study nonlinear optics in the xuv region. In this paper we will describe our efforts to produce collisionally pumped short pulse x-ray lasers. Initial results, which have produced approximately 45 ps (FWHM) x-ray lasers, using a double pulse irradiation technique, are presented along with a discussion of the prospects for reducing the pulse width. DYNAMIC BEHAVIORS OF FRAGMENTS EJECTED FROM THE SURFACE OF CARBON MATERIALS BY LASER ABLATION
Osamu Yoda (Japan Atomic Energy Research Inst., Takasaki.), Atsumi Miyashita (Japan Atomic Energy Research Inst., Takasaki.), Takasumi Ohyanagi, and Kouichi Murakami Oct. 1992 35 p Limited Reproducibility: More than 20% of this document may be affected by poor print
(DE93-788620; JAERI-M-92-173) Avail: Issuing Activity (Department of Energy (DOE))

A time-resolved X-ray absorption spectroscopy apparatus on the laboratory scale has been set-up by utilizing laser plasmas as an X-ray source. One of the major goals for this apparatus is to observe X-ray absorption fine structures (XAFS) of various materials during materials processing in an energy region between 100 eV and 3 keV. For this purpose, we have provided two sets of optical and detecting systems. The most intense X-rays are generated from Au plasma and the intensity reaches as high as 10(exp 16) photons/pulse in 2(pi) steradian in the energy region below 300 eV. The energy resolution of the spectrometer (Delta)E/E has been determined to be 5(10)(exp -3). The dynamic behavior of fragments ejected from the surface by laser ablation has been observed for a carbon rod and a pellet of C60 powder. Dominant fragments removed from the carbon rod have been found to be clusters, neutral atoms and ions. Maximum velocities of ejected clusters and atoms have been estimated to be less than 1.4 (10)(exp 4) m/s and more than 2(10)(exp 4) m/s, respectively. C60 molecules have been removed from the pellet surface without decomposition by mild laser ablation. X-ray photoelectron measurements suggest that some reorganization has occurred on the surface of the ablated C60 pellet. A periodic structure has been discovered on the laser ablated C60 pellet, and the spacing of that periodic structure is explained by the surface scattering model. DOE

TUNABLE SYNCHRONOUSLY PUMPED INTRACAVITY TWO-STAGE OPTICAL FREQUENCY UPCONVERSION Final Report, May - Oct. 1992
Gerald T. Moore Jun. 1993 10 p
(Contract F29601-92-C-0022)
(AD-A269105; PL-TN-93-1025) Avail: CASI HC A02/MF A01

Optical parametric oscillation (OPO) with intracavity sum-frequency generation (SFG) of the signal and pump has been studied theoretically and numerically, using the CW plane wave theory as well as a numerical code developed to simulate either synchronously pumped pulse propagation or walk-off effects in one transverse dimension. The configuration where the SFG crystal precedes the OPO crystal in the cavity gives stable high-efficiency conversion over a larger range of pump intensity, as well as lower power loading on the OPO crystal. About 85 percent conversion efficiency from 1.064 microns to 589 nm is predicted at pump intensities up to 9 MW/sq cm for a device using AgGaS2 and KTP crystals. Also, the angular distribution of parametric fluorescence from AgGaS2 has been calculated in good agreement with measurements made at the Phillips Laboratory. DTIC

NITRIDATION OF GaAs(100) BY LASER-INDUCED DECOMPOSITION OF HN3 Technical Report
Y. Bu and M. C. Lin 1993 10 p
(Contract N00014-89-J-1235)
(AD-A269147; TR-21-ONR) Avail: CASI HC A02/MF A01

GaAs can be readily nitridated at low temperatures by photolysis of adsorbed HN3 at 308 nm. The annealing of the exposed and photolyzed samples at 450 K, GaN, AsN and bridged AsNGa species were detected by HREELS and XPS. Further annealing at 780 K caused the desorption of most AsN species while GaN and AsNGa nitrides remained on the surface. DTIC

NONLINEAR THOMSON SCATTERING OF INTENSE LASER PULSE FROM BEAMS AND PLASMAS Memorandum Report
Eric Esarey, Sally K. Ride, and Phillip Sprangle 23 Aug. 1993 55 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A269556; NRL/MR/6790-93-7365) Avail: CASI HC A04

A Comprehensive theory is developed to describe the nonlinear Thomson scattering of intense laser fields from beams and plasmas. This theory is valid for linearly or circularly polarized incident laser fields of arbitrary intensities and for electrons of arbitrary energies. Explicit expressions for the intensity distributions of the scattered radiation are calculated and numerically evaluated. The space-charge electrostatic potential, which is important in high density plasmas and prevents the axial drift of electrons, is included self-consistently. Various properties of the scattered radiation are examined, including the linewidth, angular distribution, and the behavior of the radiation spectra at ultrahigh intensities. Non-ideal effects, such as electron energy spread and beam emittance, are discussed. A laser synchrotron source (LSS), based on nonlinear Thomson scattering, may provide a practical method for generating tunable, near monochromatic, well collimated, short pulse x-rays in a compact, relatively inexpensive source. Two examples of possible LSS configurations are presented: an electron beam LSS generating hard (30 keV, 0.4 A) x-rays; and a plasma LSS generating soft (0.3 keV, 40 A) x-rays. These LSS configurations are capable of generating ultrashort (approximately 1 ps) x-ray pulses with high peak flux (greater than 10(exp 21) photons/s) and brightness (greater than 10(exp 19) photons/s-sq mm-sq mrad 0.1% BW). The technology base formed by the development of high peak power simulators, laser drivers, FEL's, and ICF drivers from the early 60's through the late 80's is being extended to high average power short-pulse machines with the capabilities of supporting new types of manufacturing processes and performing new roles in environmental cleanup applications. This paper discusses a process for identifying and developing possible commercial applications, specifically those requiring very high average power levels of hundreds of kilowatts to perhaps megawatts. The authors discuss specific technology requirements and give examples of application development efforts. The application development work is directed at areas that can possibly benefit from the high specific energies attainable with short pulse machines. DOE

DESIGNS FOR A 10.6 MICROMETER ELECTROMAGNETIC WIGGLER FREE-ELECTRON LASER (FEL)
Arne W. Fliflet and Wallace M. Manheimer 30 Aug. 1993 32 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A269695; NRL/MR/6793--93-7373) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The possibility of developing gyrotron-powered electromagnetic wiggler free-electron laser (FEL) oscillators is of considerable interest for reducing the electron energy required for operation in the infrared spectrum. This memorandum considers the design of a 10.6 micron electromagnetic wiggler FEL experiment based on the University of California at Santa Barbara (UCSB) 6 MeV electrostatic accelerator. Both waveguide and quasioptical wiggler resonator configurations are considered. A prescription for optimizing the gain of a waveguide electromagnetic wiggler FEL is derived and the nonlinear regime is treated by relating the electromagnetic wiggler FEL equations-of-motion to the Universal normalized FEL equations. Point designs are given showing accelerator, gyrotron, and output parameters for 10.6 micron Proof-of-Principle FEL experiments based on both waveguide gyrotron and quasioptical gyrotron wigglers. Designs are given for both 5 A and 2 A FEL electron beam currents. DTIC

PHASE CONJUGATION AND BEAM COMBINATION USING STIMULATED BRILLOUIN SCATTERING Final Report, 21 Apr. 1989 - 31 Jan. 1992
Joel Falk and Morton Kanefsky Jul. 1993 30 p
(Contract F29601-89-K-0019)
(AD-A269899; AD-E201594; PL-TR-93-1007) Avail: CASI HC A03/MF A01

This report summarizes work performed on the use of stimulated Brillouin scattering for phase conjugation and beam combination. The mutual coherence between two stimulated Brillouin signals produced by two, partially overlapped pumped beams is studied both experimentally and theoretically. In addition, the transient buildup of a phase conjugate Stokes beam is described using a zero-order numerical solution to the governing equations. DTIC

THE EFFICIENCY OF CONTINUOUS OUTPUT OF SOME TITANIUM-DOPED GEM-CRYSTAL LASERS HAS EXCEEDED 1 W
8 Sep. 1993 6 p Transl. into ENGLISH from Zhongguo Jigung, China, v. 19, no. 6, 1992 p 447
(AD-A269953; FASTC-ID(RS)T-0041-93) Avail: CASI HC A02/MF A01

By use of the induced furnace up-pumping method (IFUS) developed by the authors, a new technique enables the growth of a titanium-doped gem crystal which can emit pulses in the forward as well as in the backward direction in the preparation of a continuous laser beam transmission. Since December of 1991 after it first appeared in China, the continuous transmission of a titanium crystal laser with hydrogen ion laser-pumping has reached a laser output efficiency of 303 mW and the threshold efficiency of 1.5 W. Recently, the crystalline mass grown has made another step forward to form a continuously lasing apparatus which acquired new progress in the output efficiency and resonance-harmonization capability. IMAGING AND BLACKBODY EMISSION SPECTRA OF HOT PARTICULATES GENERATED DURING LASER ABLATION
D. B. Geohegan 19 Apr. 1993 9 p Presented at the 2nd International Conference on Laser Ablation: Mechanisms and Applications, Knoxville, TN, 19-22 Apr. 1993
(Contract DE-AC05-84OR-21400)
(DE93-015818; CONF-9304144-7) Avail: CASI HC A02/MF A01

Blackbody emission from particulates generated during KrF-laser ablation of Y(1)Ba(2)Cu(3)O(7-x) (YBCO) and BN has been recorded for the first time by sensitive photography and emission spectroscopy in order to study the velocity, temperature and cooling of the ejecta. The techniques of fast, intensified-CCD photography and emission spectroscopy with photon-counting sensitivity are described as diagnostics for particulate generation and temperature measurement for a wide variety of materials used for pulsed laser deposition. Time-of-flight velocities inferred from the two techniques indicate velocities (v approximately (0.45-1.2) x 10(sup 4) cm s(sup -1)) comparable to those measured for the large particles which often accompany the pulsed laser deposition (PLD) process. Gated photon counting is employed to obtain temporally resolved spectra of this weak emission. The spectral shape is characteristic of blackbody emission. The spectra shift to longer wavelengths as the particles cool during flight in vacuum. Estimates of the temperature of the particles are made based on the emissivity of a perfect blackbody and range from 2200 K to 3200 K for both BN and YBCO when irradiated at Phi(sub 248) = 3.5 J cm(sup -2) and 1.5 J cm(sup -2), respectively. The temperature decrease of the particles in vacuum is compared to a radiative cooling model which gives estimates of the initial surface temperature and radii of the particles. DOE

The focus of the Maryland Program is to establish strong experimental and theoretical support for ongoing programs at NRL. Areas of research which are of mutual interest are pursued by members of the University of Maryland faculty in collaboration with their counterparts at NRL. The proposal encompasses basically three broad areas of research activities. The first area deals with excimer laser technology and the interaction of high power lasers with matter (gases, solids, and plasma). The second area of mutual

interest involves diagnostics of intense relativistic electron beams and study of their propagation and interaction with a background gas. The nonlinear temporal dynamics in neural networks is the third area for collaboration.

TUNABLE YTTERBIUM-DOPED SOLID STATE LASER Patent Application
John M. McMahon, inventor (to Navy), Leon Esterowitz, inventor (to Navy), and Robert C. Stoneman, inventor (to Navy) 30 Jul. 1993 14 p
(AD-D015878; US-Patent-Appl-SN-099638) Avail: CASI HC A03/MF A01

A tunable ytterbium-doped solid-state laser has a laser cavity defined by a pair of mirrors, a laser medium positioned in this cavity, means for pumping the laser medium, and means for tuning the output of this laser medium to a selected wavelength within a wavelength range. The laser medium has a host material doped with enough ytterbium ions to produce a longitudinal mode laser emission when the laser medium is pumped. In a most preferred embodiment, the laser emission is frequency-doubled and tuned to a wavelength corresponding to a Fraunhoffer line in the solar spectrum.

A TUNABLE COMPACT HIGH POWER FAR-INFRARED GRATING FREE-ELECTRON LASER Interim Report
B. Hafizi, P. Sprangle, and A. Fisher 13 Sep. 1993 34 p
(AD-A269875; NRL/MR/6790-93-7384) Avail: CASI HC A03/MF A01

The linear and nonlinear operation of a multiwave grating free-electron laser is described. The radiation is generated by the passage of an annular electron beam through a coaxial waveguide with the central conductor being in the form of a corrugated cylinder. The model includes the effects of self-field forces, beam emittance and gyromotion of electrons in a guide magnetic field. The efficiency is determined by numerical simulation and compared with analytical estimates. A compact source that is tunable in the band 35-55 micron with output in the kilowatt range is shown to be feasible.

DIRECT SOLAR PUMPING OF SEMICONDUCTOR LASERS: A FEASIBILITY STUDY Final Report
Neal G. Anderson 30 Apr. 1992 9 p
(Grant NAG1-1148)
(NASA-CR-193760; NAS 1.26:193760) Avail: CASI HC A02/MF A01

This report describes results of NASA Grant NAG-1-1148, entitled Direct Solar Pumping of Semiconductor Lasers: A Feasibility Study. The goals of this study were to provide a preliminary assessment of the feasibility of pumping semiconductor lasers in space with directly focused sunlight and to identify semiconductor laser structures expected to operate at the lowest possible focusing intensities. It should be emphasized that the structures under consideration would provide direct optical-to-optical conversion of sunlight into laser light in a single crystal, in contrast to a configuration consisting of a solar cell or storage battery electrically pumping a current injection laser. With external modulation, such lasers could perhaps be efficient sources for intersatellite communications. We proposed specifically to develop a theoretical model of semiconductor quantum-well lasers photopumped by a broadband source, test it against existing experimental data where possible, and apply it to estimating solar pumping requirements and identifying optimum structures for operation at low pump intensities. These tasks have been accomplished, as described in this report of our completed project. The report is organized as follows: Some general considerations relevant to the solar-pumped semiconductor laser problem are discussed in Section 2, and the types of structures chosen for specific investigation are described. The details of the laser model we developed for this work are then outlined in Section 3. In Section 4, results of our study are presented, including designs for optimum lattice-matched and strained-layer solar-pumped quantum-well lasers and threshold pumping estimates for these structures. It was hoped at the outset of this work that structures could be identified which could be expected to operate continuously at solar photoexcitation intensities of several thousand suns, and this indeed turned out to be the case as described in this section. Our project is summarized in Section 5, and information on publications resulting from this work is provided in Section 6.

PROOF OF THE FEASIBILITY OF COHERENT AND INCOHERENT SCHEMES FOR PUMPING A GAMMA RAY LASER Final Report, 24 Dec. 1989 - 31 May 1993
C. B. Collins 31 Aug. 1993 218 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-90-K-2001)
(AD-A269173; GRL/9301) Avail: CASI HC A10

The most productive approaches to the problem of the gamma-ray laser have focused upon upconversion techniques in which metastable nuclei are pumped with long wavelength radiation. At the nuclear level, the storage of energy can approach tera-Joules (10(exp 12)J) per liter for thousands of years. However, any plan to use such a resource for a gamma-ray laser poses problems of a broad interdisciplinary nature requiring the fusion of concepts taken from relatively unrelated fields of physics. Our research group has described several means through which this energy might be coupled to radiation fields with cross sections for stimulated emission that could reach 10(exp -17)sq cm. Such a stimulated release could lead to output powers as great as 3 x 1021 Watts/liter. Since 1978, we have pursued an approach for the upconversion of longer wavelength radiation incident upon isomeric nuclear populations that can avoid many of the difficulties encountered with traditional concepts of single photon pumping. Experiments have confirmed the general theory and have indicated that a gamma-ray laser is feasible if the right combination of energy levels and branching ratios exists in some real material. Of the 1,886 distinguishable nuclear materials, the present state-of-the-art has been adequate to identify 29 first-class candidates, but further evaluation cannot proceed without remeasurements of nuclear properties with higher precision.

LASER POWERED BEAM CONDITIONER FOR FREE-ELECTRON LASERS AND SYNCHROTRONS

H. Liu, G. R. Neil, C. Sinclair, and B. Yunn Jun. 1993 5 p Presented at the International Particle Accelerator Conference, Washington, DC, 17-20 May 1993
(Contract DE-AC05-84ER-40150)
(DE93-017821; DOE/ER-40150/227; CEBAF-PR-93-030; CONF-930511-316) Avail: CASI HC A01/MF A01

A new method of using an additional laser for electron beam conditioning in free-electron lasers (FEL's) and synchrotrons is proposed. Theoretical analysis and calculations are presented, showing that the axial energy spread of electrons due to their betatron motion in undulators can be dramatically reduced by interacting with a quasi-TEM(sub 10) Gaussian mode optical beam. It is required that the electrons be prebunched over half an optical cycle in advance. DOE

COHERENCE AND LINEWIDTH STUDIES OF A 4-nm HIGH POWER FEL

W. M. Fawley, A. M. Sessler, and E. T. Scharlemann (Lawrence Livermore National Lab., CA.) May 1993 5 p Presented at the International Particle Accelerator Conference, Washington, DC, 17-20 May 1993
(Contract DE-AC03-76SF-00098)
(DE93-018533; LBL-33285; HIFAN-570; CONF-930511-323) Avail: CASI HC A01/MF A01

Recently the SSRL/SLAC and its collaborators elsewhere have considered the merits of a 2 to 4-nm high power FEL utilizing the SLAC linac electron beam. The FEL would be a single pass amplifier excited by spontaneous emission rather than an oscillator, in order to eliminate the need for a soft X-ray resonant cavity. We have used GINGER, a multifrequency 2D FEL simulation code, to study the expected linewidth and coherence properties of the FEL, in both the exponential and saturated gain regimes. We present results concerning the effective shot noise input power and mode shape, the expected subpercent output line widths, photon flux, and the field temporal and spatial correlation functions. We also discuss the effects of tapering the wiggler upon the output power and line width. DOE

LASER GUIDE STAR MEASUREMENTS AT LAWRENCE LIVERMORE NATIONAL LABORATORY

H. Friedman, K. Avicola, H. Bissinger, J. Brase, J. Duff, D. Gavel, J. Horton, C. Max, S. Olivier, and D. Rapp et al Feb. 1993 16 p Presented at the Society for Photo-Optical Instrumentation Engineers (SPIE) International Conference, Albuquerque, NM, 31 Jan. - 4 Feb. 1993
(Contract W-7405-eng-48)
(DE93-018081; UCRL-JC-113177; CONF-930171-4) Avail: CASI HC A03/MF A01

Recent studies from the Laser Guide Star Project at Lawrence Livermore National Laboratory are presented. Photometry of the return signal has shown that the photon return is approximately 10 photons/sq cm/ms at the pupil of the receiving telescope in agreement with a detailed model of the sodium interaction. Wavefronts of the laser guide star have also been measured with a Shack-Hartmann technique and power spectra have been shown to agree with those of nearby natural stars. Plans for closed loop demonstrations using the laser guide star at LLNL and nearby Lick Observatory are discussed. DOE

CUTTING AND DRILLING STUDIES USING HIGH POWER VISIBLE LASERS

D. D. Kautz, E. P. Dragon, M. E. Werve, R. S. Hargrove, and B. E. Warner 27 May 1993 10 p Presented at the 1992 International Conference on Lasers, Houston, TX, 7-11 Dec. 1992
(Contract W-7405-eng-48)
(DE93-019149; UCRL-JC-111666; CONF-921256-7) Avail: CASI HC A02/MF A01

High power and radiance laser technologies developed at Lawrence Livermore National Laboratory such as copper-vapor and dye lasers show great promise for material processing tasks. Evaluation of models suggests significant increases in welding, cutting, and drilling capabilities, as well as applications in emerging technologies such as micromachining, surface treatment, and stereolithography. Copper lasers currently operate at 1.8 kW output at approximately three times the diffraction limit and achieve mean time between failures of more than 1,000 hours. Dye lasers have near diffraction limited beam quality at greater than 1.0 kW. Results from cutting and drilling studies in titanium and stainless steel alloys show that cuts and holes with extremely fine features can be made with dye and copper-vapor lasers. High radiance beams produce low distortion and small heat-affected zones. The authors have accomplished very high aspect ratios (less than 60:1) and features with micron scale (5-50 microns) sizes. The paper gives a description of the equipment, discusses cutting theory, and gives experimental results of cutting and drilling studies on Ti-6Al-4V and 304 stainless steel. DOE

PULSED POWER SUPPLY FOR NOVA UPGRADE

J. L. Bacon, J. P. Kajs, A. Walls, W. F. Weldon, and R. C. Zowarka 1992 106 p Prepared for LLNL, CA
(Contract W-7405-eng-48)
(DE93-019626; UCRL-CR-112610) Avail: CASI HC A06/MF A02

This report describes work carried out at the Center for Electromechanics at The University of Texas at Austin (CEM-UT). A baseline design of the Nova Upgrade has been completed by Lawrence Livermore National Laboratory. The Nova Upgrade is an 18 beamline Nd:glass laser design utilizing fully relayed 4 x 4 30 cm aperture segmented optical components. The laser thus consists of 288 independent beamlets nominally producing 1.5 to 2.0 MJ of 0.35 micron light in a 3 to 5 ns pulse. The laser design is extremely flexible and will allow a wide range of pulses to irradiate ICF targets. This facility will demonstrate ignition/gain and the scientific feasibility of ICF for energy and defense applications. The pulsed power requirements for the Nova Upgrade are given. CEM-UT was contracted to study and develop a design for a homopolar generator/inductor (HPG/inductor) opening switch system which would satisfy the pulsed power supply requirements of the Nova Upgrade. The Nd:glass laser amplifiers used in the Nova Upgrade will be powered by light from xenon flashlamps. The pulsed power supply for the Nova Upgrade powers the xenon flashlamps. This design and study was for a power supply to drive flashlamps. DOE

FIRST AND SECOND ORDER STOKES GENERATION BY SRS IN METHANE: INFLUENCE OF REP-RATE, BEAM QUALITY AND ASTIGMATISM Final Report

F. J. M. vanPutten, J. C. vandenHeuvel, and R. J. L. Lerou Sep. 1992 39 p
(FEL-92-A125; TD-92-1754; ETN-93-94943) Copyright Avail: Issuing Activity (TNO Physics and Electronics Laboratory, P.O. Box 96864, 2509 JG The Hague, Netherlands)

Experiments to obtain a high efficiency for conversion of 1064 nm to eye safe 1543 nm radiation by Stimulated Raman Scattering (SRS) in methane were performed. A first order Stokes photon conversion efficiency of about 75% is obtained for an input energy of 280 mJ, using combinations of cylindrical lenses for focusing. The highest obtainable efficiency appears to be limited by generation of second order Stokes radiation, at a wavelength of 2805 nm. The energy of the second order Stokes component could be increased to 17.9 mJ. Without circulation of the gas in the Raman cell, thermal blooming effects decreased the efficiency and caused deflection of the beam at pulse repetition rates above 3 Hz. With a gas circulating device, a high efficiency up to 10 Hz was maintained. Threshold and beam profile measurements are included. Beam profile measurements showed that the laser beam can be regarded as 'near Gaussian and diffraction limited' only when the smallest available 1.5 mm diaphragm is placed in the laser cavity. With larger laser diaphragms the parameter describing the quality of the laser beam must be taken into account. The influence of the beam quality is included in the numerical model and was confirmed by the experimental results. ESA

Properties of SLA (Semiconductor Laser Amplifier), which are particularly interesting for application to linear repeaters in coherent multichannel systems, are studied and design rules for future optimized amplifier structure are deduced. Laser diode antireflection was examined and reflection factor was measured. Low signal properties were discussed considering injection current, wavelengths, temperature and polarization. The coupling between amplifiers and glass fibers was examined. The utilization of cascade amplifiers as linear repeaters in multichannel heterodyne systems and television distribution systems was investigatied. The following results are obtained: measurement and calculation of the paradiaphony between two signals radiated in a SLA; multichannel data transfer through a SLA; polarization independent amplification with SLA configurations; measurement of the frequency dependence of four wave mixing sidelines in a SLA; measurement of the system degradation through echoes in a bidirectional SLA chain; data transmission with frequency conversion and calculation of multichannel transmission systems with cascade SLA, taking into account saturation, signal to noise ratio, bandwidth reduction and echo. (DE93-040688; DOE/ER-61229/2) Avail: CASI HC A03/MF A01

This Center-of-Excellence grant has supported the development of an imaging system based on microlaser arrays. In the second year of the grant, we dealt with the slow delivery of new microlaser arrays by developing a new approach to the idea of all-solid-state confocal microscopy. One solution was moderately successful, and the other has produced the first microscope that is electronically switchable from confocal to non-confocal. We think this may be a useful alternative to the final design. This report thus discloses patentable material. We describe first the central Microlaser Microscope project, then we will touch briefly on the other projects of the Center. The publications are primarily those of the smaller projects, though no longer exclusively so. The appendix includes some of the publications. DOE

A STUDY OF THE AMPLIFICATION OF LASER AND VLF WAVES USING A SIMPLE PENDULUM MODEL Ph.D. Thesis
Keith A. Sturgess Jun. 1993 103 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A270857) Avail: CASI HC A06

The Lorentz force equation governing the interaction between radiation and charged particles in the presence of a static magnetic field can be reduced to the form of the simple pendulum equation, when applied to the Free Electron Laser (FEL) and to the amplification of whistler waves in the magnetosphere. The first topic in this thesis is the start-up of an FEL with a compact design having a small, spatial undulator period, many periods, and a small undulator field strength. Under these conditions, the number of photons spontaneously emitted into the resonator mode each pass is so small that a classical field cannot be established. Quantum fluctuations affect the wave-particle interaction and therefore diminish weak field gain. An FEL start-up condition, several orders of magnitude more restrictive than determined by quantum recoil alone, is derived from the photon rate equation. The next topic is the evolution of a weak, classical radiation field driven by a long electron pulse. DTIC

NOVEL NONLINEAR LASER DIAGNOSTIC TECHNIQUES Final Report, 1 Jun. 1990 - 31 Jul. 1993
Gregory W. Faris, Jay B. Jeffries, and David L. Huestis Jul. 1993 162 p
(Contract F49620-90-C-0044)
(AD-A270968; SRI-MP-93-137; AFOSR-93-0755TR) Avail: CASI HC A08/MF A02

Research on laser-based diagnostic techniques in two areas is described: (1) extension of laser-based diagnostics to shorter wavelengths for two-photon detection of atomic ions and other detection techniques requiring high powers in the VUV and (2) investigation of quantitative concentration, temperature, and velocity measurements using two-photon-excited amplified spontaneous emission (ASE) of atomic oxygen and hydrogen. For the first task, a broadly tunable high power VUV source based on two-photon-resonant difference frequency mixing in hydrogen and krypton gas was developed. Up to 65 mJ at 133 nm was generated and wavelengths as short as 122 nm were produced. This radiation was applied to multiphoton spectroscopy at VUV wavelengths below 150 nm, including two-photon-excited fluorescence in neon at 133 nm. Research on Task 2 included demonstration measurements of the bandwidth of ASE signals from both oxygen and hydrogen atoms in low-pressure flames. A model of the ASE signal shows gas temperature determination from ASE bandwidth measurements is possible. Gain on a cw diode probe laser from two-photon-excited oxygen atoms was demonstrated in low-pressure flames; from such direct gain measurements, quantitative atom concentration measurements are feasible. ELECTRICALLY CONTROLLED LIQUID-CRYSTAL HEAT VALVE Patent
Rand R. Biggers, inventor (to Navy), Jeff W. Rish, III, inventor (to Navy), Girardeau L. Henderson, inventor (to Navy), Chuong N. Pham, inventor (to Navy), and Robert R. Fuller, inventor (to Navy) 29 Jun. 1993 16 p Filed 26 May 1992
(AD-D015872; US-Patent-5,222,548; US-Patent-Appl-SN-888096) Avail: CASI HC A02/MF A01

An improved electrically controlled thermotropic liquid-crystal heat valve to control the flow of heat between two bodies of different temperatures by interposing there between a fluid layer of liquid-crystal material having a nematic temperature range that includes the temperature of both bodies. This type of heat valve has particular application to any free-swimming divers' diving garments, to provide some thermal protection against the cold ambient water. The heat valve uses stable liquid-crystal materials encapsulated in a sealed environment, with the valves' electrodes being shielded and not in direct electrical contact with the liquid-crystal material. This arrangement essentially completely eliminates the electrochemical effects which can otherwise degrade the liquid-crystal materials, so that the liquid crystal may function for a very long time. The valve is electrically controlled between the respective two different modes of its open and closed conditions, the open mode occurring when a low frequency AC field is applied to one of the liquid crystal materials; and the closed mode occurring when a high frequency field is applied to effect reorientation of the molecules of the liquid crystal materials in a direction perpendicular to the applied AC field, precluding establishment of convective flow cells, thereby retarding the transfer of heat. INTERDISCIPLINARY RESEARCH ON WEAR OF MATERIALS Final Report, 1 Oct. 1991 - 20 Sep. 1992
D. A. Rigney 28 Jul. 1993 12 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-89-J-1234)
(AD-A268190) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

This interdisciplinary research was designed to provide complementary information on materials subjected to lubricated and unlubricated sliding contact. With the aid of changes in test environment, surface activation, ion implantation, electron microscopy, diffraction analysis, surface analysis (Auger and laser Raman), and fracture mechanics, basic mechanisms of wear are being related to plastic flow, stress intensity, and surface chemistry. The three main thrusts have been lubricated sliding, unlubricated sliding, and fracture considerations. DTIC

MICROSTRUCTURAL ANALYSIS OF SOLID-STATE RESISTANCE WELDS
W. R. Kanne, Jr. 1993 14 p Presented at the DOE Workshop: Sedimentary Systems, Aqueous and Organic Geochemistry, Berkeley, CA, 15-16 Jul. 1993
(Contract DE-AC09-89SR-18035)
(DE93-017295; WSRC-MS-93-008; CONF-9307107-1) Avail: CASI HC A03/MF A01

No melting is present in solid-state welds and the microstructure is therefore very different from the solidification structures found in fusion welds. Improved properties of the weld result from the solid-state metallurgical structure. Solid-state resistance welding therefore has advantages compared to fusion welding processes. Different types of solid-state resistance welds were developed for several unique applications ranging from small tube closure welds to vessel fabrication welds. Solid-state resistance upset welds have a hot worked microstructure, usually with recrystallization near the mating surfaces. Quality of the weld can be related to the metallographic appearance of the bond line at the mating surfaces. Impurities such as oxidation effect both the appearance of the bond line and weld quality. Microstructural examination of flow lines can provide a remarkably clear picture of the deformation pattern, or upsetting, that occurs during welding. Unusual effects such as multiple interfaces can be clearly seen from microstructural examination. Hardness traverses across metallographic sections are used to relate weld area strength to microstructural characteristics. Solid-state weld and heat-affected zone strengths were compared to base metal and to fusion weld strengths using hardness data. DOE

CORROBORATION OF MAGNETIC FORCES IN US MAGLEV DESIGN
H. Coffey, J. He, and Z. Wang 1993 6 p Presented at the 12th International Conference on Magnetically Levitated Systems and Linear Drives, Argonne, IL, 19-21 May 1993
(Contract W-31-109-eng-38)
(DE93-014918; ANL/ES/CP-79714; CONF-930550-4) Avail: CASI HC A02/MF A01

Four System Concept Definition (SCD) contractors to the National Maglev Initiative (NMI) developed conceptual designs of maglev systems in 1991-1992. The objective of the work reported here was to perform independent calculations of the magnetic forces and fields of these four systems to assess the 'reasonableness' of the results presented to the government. Commercial computer software was used for computing forces in the system employing nonlinear ferromagnetic materials and for some calculations of induced eddy current effects in finite-sized systems. Other cases required the use of models developed at ANL and verified by experiment, or in a few cases, new computer programs that have not been validated by experiment. The magnetic forces calculated by the contractors were found to be credible in every case evaluated. The stray fields were also found to be in reasonable agreement with those calculated by the contractors, but, for lack of space, are not reported here. DOE

JOINT STIFFNESS ESTIMATION BASED ON FORCE SENSOR MEASUREMENTS IN INDUSTRIAL MANIPULATORS
Gianni Ferretti, Claudio Maffezzoni, Gianantonio Magnani, and Paolo Rocco 1992 31 p
(Rept-92-053; ETN-93-94505) Avail: Politecnico di Milano, Piazza Leonardo Da Vinci 32, 20133 Milan, Italy

The problem of estimating the stiffness constants of the joints in industrial manipulators is addressed. The model of the robot constrained by a rigid environment is shown to yield a simple relationship between variations of the motor coordinates and the forces arising at the contact with the environment. By exploiting the measurements of the motor positions sensors and of a force sensor located at the end effector, two methods are proposed to simply compute good estimates of the stiffness constants. Experiments were made on the industrial robot SMART and the results are given and discussed. ESA

EFFICIENT DYNAMIC MODELING OF MANIPULATORS CONTAINING CLOSED KINEMATIC LOOPS
Gianni Ferretti and Paolo Rocco 1992 34 p
(Rept-92-083; ETN-93-94509) Avail: Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy

An approach to efficiently solve the forward dynamics problem for manipulators containing closed chains is proposed. The two main distinctive features of this approach are: the dynamics of the equivalent open loop tree structures (any closed loop can be in general modeled by imposing some additional kinematic constraints to a suitable tree structure) is computed through an efficient Newton Euler formulation; the constraint equations relative to the most commonly adopted closed chains in industrial manipulators are explicitly solved, thus, overcoming the redundancy of Lagrange's multipliers method while avoiding the inefficiency due to a numerical solution of the implicit constraint equations. The constraint equations considered for an explicit solution are those imposed by articulated gear mechanisms and planar closed chains (pantograph type structures). Articulated gear mechanisms are actually used in all industrial robots to transmit motion from actuators to links, while planar closed chains are usefully employed to increase the stiffness of the manipulators and their load capacity, as well to reduce the kinematic coupling of joint axes. The accuracy and the efficiency of the proposed approach are shown through a simulation test. ESA

Complex surfaces digitalization and measuring techniques are overviewed. The measurement of complex surfaces is a very important chapter in technology of three dimensional measurements. The difficulties come from the fact that the surface to be digitalized has a mathematically unmodeled geometry. The choice of the measuring machine, the measurement strategy and the degree of integration with a computer assisted design system determine the possibilities and the user friendly qualities of this measuring technique. Several aspects of tool management which need special attention when planning the acquisition of a tool management system are presented. Functionalities of available systems and the successive steps to be considered before application to industrial uses are analyzed. An example is tool management applied to an industrial machining sector. The advantages and disadvantages of different approaches concerning hard and soft materials are summarized. The way followed by the tools from their arrival until they reach the machines and the role of the tool management system at each step are described. The costs due to the implementation of a tool management systems are evaluated. Some available systems are described. ESA

AN EMULATOR FOR TESTING HVAC-CONTROL AND ENERGY MANAGEMENT SYSTEMS [LVI-SAEAETOE- JA ENERGIAJAERJESTELMIEN KOESTUS- JA TESTAUSLAITTEISTO (EMULAATTORI). LAITETEKNINEN KUVAUS]
Paeivi Laitila, Satu Kaerki, Kalevi Piira, Katri Katajisto, and Reijo Kohonen Feb. 1992 66 p In FINNISH Sponsored by Kauppa-ja Teollisuusministerio, Helsinki, Finland
(VTT-TIED-1337; ISBN-951-38-4150-2; ETN-93-94473) Copyright Avail: CASI HC A04/MF A01

A technical description of an emulator for control and energy systems is presented. The emulator is made up of both physical components and numerical models programmed for a computer. In the emulator, the building and its internal and external heart and moisture loads are numerical models in all cases, if they are included in the system under study. The emulator can be used to study control equipment and energy management systems as well as other devices such as heat producing equipment. This is facilitated by the emulator's physical test equipment, which comprises an exchangeable heat producing device, two separate cooling water systems and their heat exchangers, and the mains water supply. At the heart of the emulator's ADP hardware are two microcomputers linked by an Ethernet line. The TRNSYS simulation software has been installed in one of the microcomputers, and the GENESIS process control program in the other. GENESIS is not needed for running the emulation. The process interface equipment and simulation software are connected to one another via their RS-232 serial ports. The performance functionality of the emulator was tested by investigating the control of an air conditioning system with a commercial controller (substation). ESA

A FINITE STRAIN RING DYNAMICAL MODEL FOR PNEUMATIC TIRES Final Report, May 1992 - May 1993
Ned J. Lindsley Aug. 1993 104 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A269286; WL-TR-93-3089) Avail: CASI HC A06

In this report, using the most general 'plane sections remain plane' rod theory and the continuum mechanics approach, the exact strain expressions for a shearable, extensible ring are derived. These expressions are nonlinear in terms of both the displacements and the geometry of the ring and are Taylor series approximated after their derivation. A linear viscoelastic stress-strain relationship is assumed. The radial stress is considered negligible. The model includes extension of the neutral axis, transverse shear deformation, and the full complement of inertial forces created by rotation of the ring. A pretensioning force due to pressurizing the tire is included. The tire sidewall (viscoelastic foundation) is considered to act in a completely radial direction. The equations of motion are developed from the free body and inertial force diagrams of a differential element. The membrane forces and bending moment are then substituted to yield three nonlinear equations of motion. The equations of motion are then put into matrix form with the linear and nonlinear portions separated. Chapters 3 and 4 study linear wave propagation, while Chapter 5 provides verifying comparison examples with existing finite element codes, as well as a numerical example for the KC-135 transport aircraft tire. THERMAL INSULATION OF WET SHIELDED METAL ARC WELDS M.S. Thesis
Patrick J. Keenan Jun. 1993 80 p
(Contract N00123-89-G-0580)
(AD-A268697) Avail: CASI HC A05/MF A01

Computational and experimental studies were performed to determine the effect of static thermal insulation on the quality of wet shielded metal arc welds (SMAW). A commercially available heat flow and fluid dynamics spectral-element computer program was used to model a wet SMAW and to determine the potential effect on the weld cooling rate of placing thermal insulation adjacent to the weld line. Experimental manual welds were made on a low carbon equivalent (0.285) mild steel and on a higher carbon equivalent (0.410) high tensile strength steel, using woven fabrics of alumina-boria-silica fibers to insulate the surface of the plate being welded. The effect of the insulation on weld quality was evaluated through the use of post-weld Rockwell Scale hardness measurements on the surface of the weld heat affected zones (HAZ's) and by visual inspection of sectioned welds at 10 X magnification. The computational simulation demonstrated a 150% increase in surface HAZ peak temperature and a significant decrease in weld cooling rate with respect to uninsulated welds, for welds in which ideal insulation had been placed on the base plate surface adjacent to the weld line. Experimental mild steel welds showed a reduction in surface HAZ hardness attributable to insulation at a 77% significance level. A visual comparison of the cross-sections of two welds made in 0.410 carbon equivalent steel-with approximately equivalent heat input-revealed underbead cracking in the uninsulated weld but not in the insulated weld. DTIC

DESIGN CONSIDERATIONS FOR REMOTELY OPERATED WELDING IN SPACE: TASK DEFINITION AND VISUAL WELD MONITORING EXPERIMENT M.S. Thesis
Charles M. Reynerson May 1993 245 p
(Contract N00123-89-G-0580)
(AD-A268752) Avail: CASI HC A11/MF A03

This thesis explores the concept of welding in a space environment with the use of automation. Since the amount of time astronauts can work outside a spacecraft is limited, future construction and repair tasks will likely be assisted by automation. It is also likely that remote space welding will be needed for the construction of large-scale space structures in earth orbit as well as for lunar and Martian ground-based structures. Due to the complex nature of the tasks to be accomplished, the equipment will probably not be fully autonomous but instead supervised by a human operator. The welding fabrication problem in space is examined in a broad sense including some of the considerations for designing a human supervisory remote welding system. The history of space welding processes is examined, as well as current research in the field. A task definition and functional analysis is provided to assist future designers in outlining typical operational sequences for such a remote welding system. Such analysis is important when deciding whether the human operator should perform certain tasks or if the operator should supervise the automated system while it performs the tasks. DTIC

LABORATORY TEST AND EVALUATION REPORT OF THE ESSEX MODEL 60C-0037-2 MOLECULAR SIEVE OXYGEN GENERATING SYSTEM Final Report
Brendan E. Squire, James E. Bruckart, Martin Quattlebaum, and Leslie W. Johnston Jun. 1993 58 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A269967; USAARL-93-23) Avail: CASI HC A04

The Essex Model 60C-0037-2 Molecular Sieve Oxygen Generating System was tested for environmental and electromagnetic interference/compatibility under the U.S. Army Program for Testing and Evaluation of Equipment for Aeromedical Operations. The tests were conducted using current military and industrial standards and procedures for environmental tests and electromagnetic interference/compatibility and human factors. The Essex Model 60C-0037-2 performed properly in the test environments. The oxygen concentration produced by the unit depends on the compressed air pressure, oxygen flow, and vent pressure. A separate oxygen concentration analyzer would be required to determine the oxygen concentration for patient use. The unit produces a significant amount of noise while operating. DTIC

COOPERATIVE CONTROL OF MULTIPLE SPACE MANIPULATORS Ph.D. Thesis
Gary E. Yale Sep. 1993 181 p
(AD-A270291; AFIT/CI/CIA-93-20D) Avail: CASI HC A09/MF A02

This research concerns the development of cooperative control of two spacecraft mounted two-link manipulators as they reposition a common payload. Lagrangian formulation is used to determine the system equations of motion. Lyapunov stability theory is used to develop the cooperative control by using a reference trajectory and reference actuator torques. Polynomial curves represent potential reference trajectories. Numerical methods select specific reference trajectories to minimize the disturbance torque transmitted to the spacecraft during the payload repositioning maneuver. The reference actuator torques are selected to minimize weighted norms of the torques. Analytical and experimental models of planar motion are used to study the performance of different cooperative controllers. The fifth order polynomial reference trajectory leads to superior performance in terms of spacecraft attitude accuracy, actuator torque magnitude, payload repositioning accuracy, and maneuver time. The higher order polynomial reference trajectory results in only minor improvement in performance. The experimental results verify the concept of cooperative control. DTIC

MODELING OF SINGLE-CRYSTAL LASER-WELD MICROSTRUCTURES
J. M. Vitek, T. Zacharia, S. A. David, L. A. Boatner, and M. Rappaz 1993 18 p Presented at the Annual Meeting of the Minerals, Metals and Materials Society, Denver, CO, 21-25 Feb. 1993
(Contract DE-AC05-84OR-21400)
(DE93-017853; CONF-9302103-3) Avail: CASI HC A03/MF A01

A heat and fluid-flow model has been used to calculate the weld-pool size and shape for a high-speed, single-pass, autogenous laser weld as a function of time. Based on the calculated weld-pool shape, and with the use of a geometric model relating the dendritic growth to the weld-pool shape, the dendritic growth pattern was calculated for a single-crystal laser weld with an (001) surface that was welded along the (100) direction. The calculated results were compared to an actual experimental laser weld of an Fe-15Cr-15Ni alloy for the same orientation and weld direction. Agreement was obtained between the calculations and the experimental observations and the experimental dendritic growth pattern was accurately reproduced. DOE

N94-19047# Oak Ridge National Lab., TN.
EFFECTS OF IRRADIATION TEMPERATURE ON CHARPY AND TENSILE PROPERTIES OF HIGH-COPPER, LOW UPPER-SHELF, SUBMERGED-ARC WELDS
R. K. Nanstad and R. G. Berggren 1992 30 p Presented at the 16th Annual Symposium of American Society of Testing and Materials on Effects of Radiation on Materials, Denver, CO, 21-25 Jun. 1992
(Contract DE-AC05-84OR-21400)
(DE93-017858; CONF-920673-23) Avail: CASI HC A03/MF A01

This paper presents analyses of the Charpy impact and tensile test data, including adjustments for irradiation temperature and fluence normalization which make possible comparison of the irradiation sensitivity of the different welds. Analyses revealed dependence of yield and ultimate strength on irradiation temperature -0.8 MPA/C, respectively. Similarly, the Charpy impact energy changes due to irradiation temperature were -0.5 C/C for transition shift and -0.05 J/C for upper-shelf energy decrease. After adjustment to an irradiation temperature of 288 C and normalization to a fluence of 8 x 10(exp 18) neutrons/cm(exp 2) percentage increases in yield strength due to irradiation ranged from about 21 to 35% while those for ultimate strength ranged from about 13 to 20%. The Charpy transition temperature shifts ranged from 59 to 123 C while the postirradiation upper-shelf energies ranged from 58 to 79 J. DOE

ANALYTICAL AND EXPERIMENTAL EVALUATION OF JOINING SILICON NITRIDE TO METAL AND SILICON CARBIDE TO METAL FOR ADVANCED HEAT ENGINE APPLICATIONS

S. Kang, J. H. Selverian, D. ONeil, H. Kim, and K. Kim May 1993 169 p Prepared in cooperation with GTE Labs, Inc., Waltham, MA
(Contract DE-AC05-84OR-21400)
(DE93-018128; ORNL/Sub-90-SB047/2) Avail: CASI HC A08/MF A02

This report summarizes the results of Phase 2 of 'Analytical and Experimental Evaluation of Joining Silicon Nitride to Metal and Silicon Carbide to Metal for Advanced Heat Engine Applications.' A general methodology was developed to optimize the joint geometry and material systems for 650 C applications. Failure criteria were derived to predict the fracture of the braze and ceramic. Extensive finite element analyses (FEA) were performed to examine various joint geometries and to evaluate the affect of different interlayers on the residual stress state. Also, material systems composed of coating materials, interlayers, and braze alloys were developed for the program based on the chemical stability and strength of the joints during processing and service. The FEA results were compared with experiments using two methods: (1) an idealized strength relationship of the ceramic; and (2) a probabilistic analysis of the ceramic strength (NASA CARES). The results showed that the measured strength of the joint reached 30-80% of the strength predicted by FEA. Also, potential high-temperature braze alloys were developed and evaluated for the high-temperature application of ceramic-metal joints. DOE

The real noise reduction benefits which may be obtained through the use of one gear tooth form as compared to another is an important design parameter for any geared system, especially for helicopters in which both weight and reliability are very important factors. The design and testing of nine sets of gears which are as identical as possible except for their basic tooth geometry are described. Noise measurements were made at various combinations of load and speed for each gear set so that direct comparisons could be made. The resultant data was analyzed so that valid conclusions could be drawn and interpreted for design use. Author (revised)

OVERLAY WELDING IRRADIATED STAINLESS STEEL

W. R. Kanne, G. T. Chandler, D. Z. Nelson, and E. A. Franco-Ferreira 1993 14 p Presented at the 6th International Conference on Fusion Reactor Materials, Stresa, Italy, 27 Sep. - 1 Oct. 1993
(Contract DE-AC09-89SR-18035)
(DE93-018767; WSRC-MS-93-091; CONF-930928-1) Avail: CASI HC A03/MF A01

An overlay technique developed for welding irradiated stainless steel may be important for repair or modification of fusion reactor materials. Helium, present due to (n,alpha) reactions, is known to cause cracking using conventional welding methods. Stainless steel impregnated with 3 to 220 appm helium by decay of tritium was used to develop a welding process that could be used for repair. The result was a gas metal arc weld overlay technique with low-heat input and low-penetration into the helium-containing material. Extensive metallurgical and mechanical testing of this technique demonstrated substantial reduction of helium embrittlement damage. The overlay technique was applied to irradiated 304 stainless steel containing 10 appm helium. Surface cracking, present in conventional welds made on the same steel at lower helium concentrations, was eliminated. Underbead cracking, although greater than for tritium charged and aged material, was minimal compared to conventional welding methods. DOE

ATOMIC-SCALE FRICTION MEASUREMENTS USING FRICTION FORCE MICROSCOPY. PART 1: GENERAL PRINCIPLES AND NEW MEASUREMENT TECHNIQUES

Ju-Ai Ruan and Bharat Bhushan 15 Jun. 1993 11 p
(AD-A270749) Avail: CASI HC A03/MF A01

Friction force measurements using modified atomic force microscopy, called here Friction Force Microscopy (FFM), are becoming increasingly important in the understanding of fundamental mechanisms of friction, wear, and lubrication, and to study interfacial phenomena in micro- and nanostructures used in magnetic storage systems and Micro-electromechanical Systems (MEMS). FFM's can be used to study engineering surfaces in dry or wet conditions. A review of existing designs of FFM's and methods of friction force measurements is presented. In terms of friction force measurements, there are important issues related to the basic operation and calibration of these instruments which have not been fully studied. A new method of measuring friction force using a commercial FFM and a calibration procedure for conversion of measured data to normal and friction forces are presented. Microscale friction data of selected materials are presented and discussed in light of macrofriction measurements. DTIC

SURFACE SPECIES IN TRIBOLOGY Final Report, 15 Apr. 1989 - 14 Sep. 1993

Andrew J. Gellman 14 Sep. 1993 18 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0278-89)
(AD-A270970; AFOSR-93-0752TR) Avail: CASI HC A03

The global aims of this research program have been to understand the surface chemistry of materials having important applications in tribology and to understand the influence of adsorbate structure on the frictional properties of metal-metal interfaces. The materials chosen for study have been those used as boundary layer additives to lubricant mixtures. Boundary layer additives are usually amphiphilic species present in low concentrations in lubricant fluids whose role is to form surfactant-like monolayers on metal surfaces. These monolayers form the last barrier to metal-metal contact when two surfaces are in contact under sufficiently high loads that all the fluid lubricant has been squeezed out of the contact region. For the most part, our work has concentrated on the fluorinated alcohols, acids, and fluorinated alkyl groups on metal surfaces. In addition, we have begun the study of fluorinated ether surface chemistry. DTIC

ATOMIC-SCALE FRICTION MEASUREMENTS USING FRICTION FORCE MICROSCOPY. PART 2: APPLICATION TO MAGNETIC MEDIA
Bharat Bhushan and Ju-Ai Ruan Oct. 1993 8 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A270759) Avail: CASI HC A02

Atomic Force/Friction Force Microscopes (AFM/FFM) were used to study tribological properties of metal-particle tapes with two roughnesses, Co gamma Fe_2O_3 tapes (unwiped and wiped), and unlubricated and lubricated thin-film magnetic rigid disks (as-polished and standard textured). Nanoindentation studies showed that the hardness of the tapes through the magnetic coating is not uniform. These results are consistent with the fact that the tape surface is a composite and is not homogeneous. Nanoscratch experiments performed on magnetic tapes using silicon nitride tips revealed that deformation and displacement of tape surface material occurred after one pass under light loads. A comparison between friction force profiles and the corresponding surface roughness profiles of all samples tested shows a poor correlation between localized values of friction and surface roughness. TRIBOLOGICAL STUDIES OF SILICON FOR MAGNETIC RECORDING APPLICATIONS (INVITED)
Bharat Bhushan and Vilas N. Koinkar 5 Oct. 1993 24 p
(AD-A270878) Avail: CASI HC A03/MF A01

Read-write sliders made of silicon using integrated-circuit technology offer advantages of low-cost and high volume production. In the present study our objective is to investigate whether the friction and wear performance of bare silicon is adequate for disk drive application or whether certain coatings/treatments are necessary for low friction and wear. Macrotribological experiments have been performed with various pin/slider materials and magnetic disks in a modified disk drive. Microtribological studies have also been conducted on silicon using a friction force microscope. Based on macrotests, we found that the friction and wear performance of bare silicon is not adequate. With single and polycrystalline silicon, transfer of amorphous carbon from the disk to the pin/slider and oxidation-enhanced fracture of pin/slider material followed by oxidation of the transfer coating is responsible for degradation of the sliding interface and consequent friction increase in ambient air. With dry-oxidized or PECVD-SiO_2-coated silicon, no significant friction increase or interfacial degradation was observed in ambient air. In the absence of an oxidizing environment (in dry nitrogen), the coefficient of friction decreased from 0.2 to 0.05 following amorphous carbon transfer for the materials tested. Nanoscratching/nanowear and nanoindentation studies also indicate that coated silicon is superior to bare silicon. DTIC

NonDestructive Testing (NDT) is commonly used to monitor structures before, during, and after testing. This paper reports on the use of two NDT techniques to monitor the behavior of a typical wind turbine blade during a quasi-static test-to-failure. The test used a three-point spanwise load distribution to load a 7.9-m blade to failure. The two NDT techniques used were acoustic emission and coherent optical. The former monitors the acoustic energy produced by the blade as it is loaded. The latter uses electronic shearography to measure the differences in surface displacements between two load states with an accuracy of a few microns. Typical results are presented to demonstrate the ability of these two techniques to locate and monitor both high damage regions and flaws in the blade structure. Further, this experiment highlights the limitations in the techniques that must be addressed before one or both can be transferred, with a high probability of success, to the inspection and monitoring of turbine blades during the manufacturing process and under normal operating conditions. HIGH RESOLUTION SQUID MAGNETOMETRY FOR NON-DESTRUCTIVE EVALUATION Final Report, 1 Sep. 1987 - 30 Apr. 1993
John P. Wikswo 30 Apr. 1993 30 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0337-87)
(AD-A268884; AFOSR-93-0659TR) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Superconducting QUantum Interference Device (SQUID) magnetometers offer promise as multi-mode instruments capable of obtaining high resolution images of extremely low frequency injected currents or eddy currents, and they can be configured to image the magnetic susceptibility of titanium, aluminum, and nonmetallic composites. While high resolution SQUID magnetometers will generally be noisier than conventional SQUID's, the small coils and reduced coil-to-source spacing more than compensate to provide low-noise, high-resolution images. The high spatial resolution which can be obtained with SQUID magnetometers, the unparalleled sensitivity of SQUID's at low frequencies, the ability to measure weak perturbations in strong applied magnetic fields, and the ability to discriminate against external sources of noise should make SQUID magnetometers well suited for NDE of deep flaws in aluminum and titanium aerostructures. To explore SQUID NDE, we have developed research facilities that include the high-resolution MicroSQUID magnetometer, a magnetic shield, a scanning stage, and a computer-based control and data acquisition system. Using this instrumentation, we have imaged magnetic fields produced by sources as varied as intrinsic currents due to corrosion or Johnson noise, remanent magnetization from ferromagnetic contamination, flaw-induced perturbations in either injected current or eddy currents induced by an AC field, Johnson noise currents in a copper ring, persistent currents in high transition-temperature superconductors, distributions of dia- or paramagnetism in an AC or DC magnetic field, and surface flaws decorated with a paramagnetic tracer. THREE DIMENSIONAL ULTRASONIC IMAGING: AN AGING AIRCRAFT NONDESTRUCTIVE INSPECTION TOOL
G. H. Thomas, S. Benson, and S. Crawford Jul. 1993 10 p Presented at the Annual Meeting of the Society of Photo-Optical Instrumentation Engineers, San Diego, CA, 11-16 Jul. 1993
(Contract W-7405-eng-48)
(DE93-018068; UCRL-JC-112604; CONF-930722-14) Avail: CASI HC A02/MF A01

Ultrasonic nondestructive evaluation is a valuable technique for finding defects in aircraft structures. It can detect unbonds, corrosion damage, and cracks in various aircraft components. Ultrasonic nondestructive evaluation techniques interrogate materials with high frequency acoustic energy. A piezoelectric transducer generates acoustic energy and converts returned acoustic energy into electrical signals which can be processed to identify the reflector. The acoustic energy propagates through the component and is reflected by abrupt changes in modulus and/or density that can be caused by a defect. Ultrasonic nondestructive evaluation typically provides a two dimensional image of internal defects. These images are either a planar view (C-scan) or a cross-sectional view (B-scan) of the component. The planar view is generated by raster scanning an ultrasonic transducer over the area of interest and capturing the peak amplitude of internal reflections. Depth information is generally ignored. The cross-sectional view is generated by scanning the transducer along a line and capturing the amplitude and time of flight for each internal reflection. The amplitude and time of flight information is converted into an image of the cross section of the component. By fusing the C-scan information with the B-scan information a three dimensional image of the internal structure of the component can be produced. The three dimensional image can be manipulated by rotating and slicing to produce the optimal view of the internal structure. Visualizing defects in three dimensions aids the interpretation of the severity of defects and helps confirm the need to repair or replace components. DOE

In this document, the author presents his observations on the topic of quality assurance (QA). Traditionally the focus of quality management has been on QA organizations, manuals, procedures, audits, and assessments; quality was measured by the degree of conformance to specifications or standards. Today quality is defined as satisfying user needs and is measured by user satisfaction. The author proposes that quality is the responsibility of line organizations and staff and not the responsibility of the QA group. This work outlines an effective Conduct of Operations program. The author concludes his observations with a discussion of how quality is analogous to leadership. DOE

APPLICATIONS OF NEURAL NETWORKS IN FAULT DETECTION OF ROTATING MACHINERY Trident Scholar Project Report No. 205
William O. Nash, Jr. 17 May 1993 52 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A270755) Avail: CASI HC A04

The purpose of this research was to design a neural network based fault diagnosis system that is capable of detecting and classifying incipient faults in rotating machinery. A neural network is essentially a pattern recognition system which produces a mapping from a set of input data to a set of output data. Neural networks are unique in that this mapping is created autonomously, based on a learning algorithm that the user specifies. In this research, the mapping is from a set of measured parameters (e.g., vibration spectrum) of the rotating machinery to a classification of the system's condition (e.g., worn bearings). Limited success has been achieved in this area over the past decade. Research to date indicates that neural networks have the ability to recognize faults in machinery. This research focused on the following objectives: (1) creating a system that can recognize basic fault conditions based on the fault's vibration signature; (2) improving the ability of the neural network to recognize transient conditions as normal rather than classify them as faults; (3) examining the effect that disturbances have on the neural network's output; and (4) developing a system that will enable detection of faults which are not included in the training set. INELASTIC DEFORMATION AND DAMAGE AT HIGH TEMPERATURE
E. Krempl 1993 4 p
(Contract DE-FG02-86ER-13566)
(DE93-018155; DOE/ER-13566/6) Avail: CASI HC A01/MF A01

Combined experimental and theoretical investigations into the inelastic deformation and damage behavior of engineering alloys at elevated temperatures are being pursued. Modeling of effects of recovery of state observed in modified 9Cr-lMo steel has been completed. Finite deformation formulations of viscoplasticity theory based on overstress (VBO) include a modified growth law for the equilibrium stress and a rationale for choosing objective derivatives of stress-like state variables. Numerical simulations are in progress. Seven biaxial low-cycle fatigue tests at 538 C have been completed with the reversing DC potential drop apparatus attached. A new method of data analysis and smoothing was developed which showed a significant increase in voltage drop in the area of crack formation. Correlation with solutions of Laplace's Equation for a semi-elliptical crack showed similar shapes for the voltage drop. DOE

IMPLEMENTATION OF MIXED FORMULATION ELEMENTS IN PC/NASTRAN
Harry G. Schaeffer *In* COSMIC, The Twenty-First NASTRAN (R) Users' Colloquium Sep. 1993 p 1-7 Prepared in cooperation with Louisville Univ., KY (For primary document see N94-17827 04-39)
Avail: CASI HC A02/MF A02

The purpose of this paper is to describe the implementation and use of a consistent family of two and three dimensional elements in NASTRAN. The elements which are based on a mixed formulation include a replacement of the original NASTRAN shear element and the addition of triangular quadrilateral shell elements and tetrahedral, pentahedral and hexahedral solid elements. These elements support all static loads including temperature gradient and pressure load. The mass matrix is also generated to support all dynamic rigid formats. Author

MODELLING CHAOTIC VIBRATIONS USING NASTRAN
T. J. Sheerer *In* COSMIC, The Twenty-First NASTRAN (R) Users' Colloquium Sep. 1993 p 17-40 (For primary document see N94-17827 04-39)
Avail: CASI HC A03/MF A02

Due to the unavailability and, later, prohibitive cost of the computational power required, many phenomena in nonlinear dynamic systems have in the past been addressed in terms of linear systems. Linear systems respond to periodic inputs with periodic outputs, and may be characterized in the time domain or in the frequency domain as convenient. Reduction to the frequency domain is frequently desireable to reduce the amount of computation required for solution. Nonlinear systems are only soluble in the time domain, and may exhibit a time history which is extremely sensitive to initial conditions. Such systems are termed chaotic. Dynamic buckling, aeroelasticity, fatigue analysis, control systems and electromechanical actuators are among the areas where chaotic vibrations have been observed. Direct transient analysis over a long time period presents a ready means of simulating the behavior of self-excited or externally excited nonlinear systems for a range of experimental parameters, either to characterize chaotic behavior for development of load spectra, or to define its envelope and preclude its occurrence. FEM/SINDA: COMBINING THE STRENGTHS OF NASTRAN, SINDA, I-DEAS, AND PATRAN FOR THERMAL AND STRUCTURAL ANALYSIS
P. Richard Zarda, Ted Anderson, and Fred Baum *In* COSMIC, The Twenty-First NASTRAN (R) Users' Colloquium Sep. 1993 p 41-59 (For primary document see N94-17827 04-39)
Avail: CASI HC A03/MF A02

This paper describes the interface/integration between FEM/SINDA, a general purpose geometry driven thermal analysis code, and the FEM software: I-DEAS, PATRAN, and NASTRAN. FEM/SINDA brings together the advantages of the finite element method to model arbitrary geometry and anisotropic materials and SINDA's finite difference capability to model thermal properties, loads, and boundary conditions that vary with time or temperature. I-DEAS and PATRAN thermal entities are directly supported since FEM/SINDA uses the nodes of the FEM model as the point at which the temperature is determined. Output from FEM/SINDA (as well as the FEM/SINDA input deck) can be used directly by NASTRAN for structural analysis. Author

There is a constant need to be able to solve for enforced motion of structures. Spacecraft need to be qualified for acceleration inputs. Truck cargoes need to be safeguarded from road mishaps. Office buildings need to withstand earthquake shocks. Marine machinery needs to be able to withstand hull shocks. All of these kinds of enforced motions are being grouped together under the heading of seismic inputs. Attempts have been made to cope with this problem over the years and they usually have ended up with some limiting or compromise conditions. The crudest approach was to limit the problem to acceleration occurring only at a base of a structure, constrained to be rigid. The analyst would assign arbitrarily outsized masses to base points. He would then calculate the magnitude of force to apply to the base mass (or masses) in order to produce the specified acceleration. He would of necessity have to sacrifice the determination of stresses in the vicinity of the base, because of the artificial nature of the input forces. The author followed the lead of John M. Biggs by using relative coordinates for a rigid base in a 1975 paper, and again in a 1981 paper . This method of relative coordinates was extended and made operational as DMAP ALTER packets to rigid formats 9, 10, 11, and 12 under contract N60921-82-C-0128. This method was presented at the twelfth NASTRAN Colloquium. Another analyst in the field developed a method that computed the forces from enforced motion then applied them as a forcing to the remaining unknowns after the knowns were partitioned off. The method was translated into DMAP ALTER's but was never made operational. All of this activity jelled into the current effort. Much thought was invested in working out ways to unshakle the analysis of enforced motions from the limitations that persisted. Derived from text

A NONITERATIVE IMPROVEMENT OF GUYAN REDUCTION
N. Ganesan *In* COSMIC, The Twenty-First NASTRAN (R) Users' Colloquium Sep. 1993 p 73-80 (For primary document see N94-17827 04-39)
Avail: CASI HC A02/MF A02

In determining the natural modes and frequencies of a linear elastic structure, Guyan reduction is often used to reduce the size of the mass and stiffness matrices and the solution of the reduced system is obtained first. The reduced system modes are then expanded to the size of the original system by using a static transformation linking the retained degrees of freedom to the omitted degrees of freedom. In the present paper, the transformation matrix of Guyan reduction is modified to include additional terms from a series accounting for the inertial effects. However, the inertial terms are dependent on the unknown frequencies. A practical approximation is employed to compute the inertial terms without any iteration. This new transformation is implemented in NASTRAN using a DMAP sequence alter. Numerical examples using a cantilever beam illustrate the necessary condition for allowing a large number of additional terms in the proposed series correction of Guyan reduction. A practical example of a large model of the Plasma Motor Generator module to be flown on a Delta launch vehicle is also presented. Author

DESIGN OPTIMIZATION STUDIES USING COSMIC NASTRAN
Stephen M. Pitrof, G. Bharatram, and Vipperla B. Venkayya *In* COSMIC, The Twenty-First NASTRAN (R) Users' Colloquium Sep. 1993 p 81-98 (For primary document see N94-17827 04-39)
Avail: CASI HC A03/MF A02

The purpose of this study is to create, test and document a procedure to integrate mathematical optimization algorithms with COSMIC NASTRAN. This procedure is very important to structural design engineers who wish to capitalize on optimization methods to ensure that their design is optimized for its intended application. The OPTNAST computer program was created to link NASTRAN and design optimization codes into one package. This implementation was tested using two truss structure models and optimizing their designs for minimum weight, subject to multiple loading conditions and displacement and stress constraints. However, the process is generalized so that an engineer could design other types of elements by adding to or modifying some parts of the code. Author

THE ROLE OF NASTRAN IN THE PRELIMINARY DESIGN CYCLE
H. R. Grooms and V. J. Baipsys *In* COSMIC, The Twenty-First NASTRAN (R) Users' Colloquium Sep. 1993 p 99-110 (For primary document see N94-17827 04-39)
Avail: CASI HC A03/MF A02

This paper explains how NASTRAN can be utilized advantageously in the preliminary design cycle. The initial portion of the preliminary design process lends itself to programs that can produce multiple configurations or variations on a particular design with minimal cost or effort. The latter portion of the process encompasses refining the design and adding more detailed analyses (particularly for other disciplines). A method for quickly generating balanced spacecraft loading conditions for use in preliminary design and analysis also is explained. The following additional sections are included: Background, Symbols, Analytical Process, Aerodynamic Load Distributions, NASTRAN Applications, Conclusion and References. Author

A METHODOLOGY TO MODEL PHYSICAL CONTACT BETWEEN STRUCTURAL COMPONENTS IN NASTRAN
Annappa A. Prabhu *In* COSMIC, The Twenty-First NASTRAN (R) Users' Colloquium Sep. 1993 p 113-125 (For primary document see N94-17827 04-39)
Avail: CASI HC A03/MF A02

Two components of a structure which are located side by side, will come in contact by certain force and will transfer the compressive force along the contact area. If the force acts in the opposite direction, the elements will separate and no force will be transferred. If this contact is modeled, the load path will be correctly represented, and the load redistribution results in more realistic stresses in the structure. This is accomplished by using different sets of rigid elements for different loading conditions, or by creating multipoint constraint sets. Comparison of these two procedures is presented for a 4 panel unit (PU) stowage drawer installed in an experiment rack in the Spacelab Life Sciences (SLS-2) payload. Author

BENCHMARKING THE QUAD4/TRIA3 ELEMENT
Stephen M. Pitrof and Vipperla B. Venkayya *In* COSMIC, The Twenty-First NASTRAN (R) Users' Colloquium Sep. 1993 p 126-141 (For primary document see N94-17827 04-39)
Avail: CASI HC A03/MF A02

The QUAD4 and TRIA3 elements are the primary plate/shell elements in NASTRAN. These elements enable the user to analyze thin plate/shell structures for membrane, bending and shear phenomena. They are also very new elements in the NASTRAN library. These elements are extremely versatile and constitute a substantially enhanced analysis capability in NASTRAN. However, with the versatility comes the burden of understanding a myriad of modeling implications and their effect on accuracy and analysis quality. The validity of many aspects of these elements were established through a series of benchmark problem results and comparison with those available in the literature and obtained from other programs like MSC/NASTRAN and CSAR/NASTRAN. Never-the-less such a comparison is never complete because of the new and creative use of these elements in complex modeling situations. One of the important features of QUAD4 and TRIA3 elements is the offset capability which allows the midsurface of the plate to be noncoincident with the surface of the grid points. None of the previous elements, with the exception of bar (beam), has this capability. The offset capability played a crucial role in the design of QUAD4 and TRIA3 elements. It allowed modeling layered composites, laminated plates and sandwich plates with the metal and composite face sheets. Even though the basic implementation of the offset capability is found to be sound in the previous applications, there is some uncertainty in relatively simple applications. The main purpose of this paper is to test the integrity of the offset capability and provide guidelines for its effective use. For the purpose of simplicity, references in this paper to the QUAD4 element will also include the TRIA3 element. Derived from text

EIGENVALUE ROUTINES IN NASTRAN: A COMPARISON WITH THE BLOCK LANCZOS METHOD
V. A. Tischler and Vipperla B. Venkayya *In* COSMIC, The Twenty-First NASTRAN (R) Users' Colloquium Sep. 1993 p 142-174 (For primary document see N94-17827 04-39)
Avail: CASI HC A03/MF A02

The NASA STRuctural ANalysis (NASTRAN) program is one of the most extensively used engineering applications software in the world. It contains a wealth of matrix operations and numerical solution techniques, and they were used to construct efficient eigenvalue routines. The purpose of this paper is to examine the current eigenvalue routines in NASTRAN and to make efficiency comparisons with a more recent implementation of the Block Lanczos algorithm by Boeing Computer Services (BCS). This eigenvalue routine is now available in the BCS mathematics library as well as in several commercial versions of NASTRAN. In addition, CRAY maintains a modified version of this routine on their network. Several example problems, with a varying number of degrees of freedom, were selected primarily for efficiency bench-marking. Accuracy is not an issue, because they all gave comparable results. The Block Lanczos algorithm was found to be extremely efficient, in particular, for very large size problems. Author

CHARPY IMPACT TOUGHNESS OF MARTENSITIC STEELS IRRADIATED IN FFTF: EFFECT OF HEAT TREATMENT
R. L. Klueh and D. J. Alexander 1992 16 p Presented at the 16th Annual Symposium of the ASTM on Effects of Radiation on Materials, Denver, CO, 21-25 Jun. 1993
(Contract DE-AC05-84OR-21400)
(DE93-015960; CONF-920673-22) Avail: CASI HC A03/MF A01

Charpy tests were made on plates of 9Cr-1MoVNb and 12Cr-1MoVW steels given four different normalizing-and-tempering treatments. One-third-size Charpy specimens from each steel were irradiated to 7.4 - 8 (times) 10(sup 26) n/m(sup 2) (about 34 - 37 dpa) at 420 C in the Materials Open Test Assembly of the Fast Flux Test Facility. Specimens were also thermally aged to 20000 h at 400 C to determine the effect of aging during irradiation. Previous work on these steels irradiated to 4 - 5 dpa at 365 C in MOTA were reexamined in light of the new results. The tests indicated that prior austenite grain size, which was varied by different normalizing treatments, had an effect on impact behavior of the 9Cr-1MoVNb but not on the 12Cr-1MoVW. Tempering treatment had relatively little effect on the shift in DBTT for both steels. Conclusions are presented on how heat treatment can be used to optimize properties. DOE

MEASUREMENT AND ANALYSIS OF THREE 1.5-GPa SHOCK-WAVE PROFILES IN COPPER

R. H. Warnes and D. L. Tonks 1993 5 p Presented at the 14th International Conference on High Pressure Science and Technology and 1993 Technical Meeting of the Topical Group on Shock Compression of Condensed Matter, Colorodo Springs, CO, 28 Jun. - 3 Jul. 1993
(Contract W-7405-eng-36)
(DE93-016559; LA-UR-93-2276; CONF-9306167-10) Avail: CASI HC A01/MF A01

Three wave-profile experiments were performed on OFE fully annealed (600 C for one hour) copper using a 101.6 mm diameter gas gun at impact velocities of 86 m/s. A symmetric impact produced a 1.5 GPa shock wave in the target. A sapphire window was bonded to the front (non-impact) face of the target, and a four-detector push-pull velocity interferometer (VISAR) measured the velocity of the copper/sapphire interface. The impactor thickness (4 mm) was the same in all experiments; the target thicknesses were 10, 20, and 30 mm. The stresses and strains, including the deviatoric stresses and strains, have been extracted from these data using a quasi-Lagrangian analysis. (The waves are not steady.) The use of three separate shots in Lagrangian analysis yields only approximate results for the deviatoric stresses; but the results for the normal stresses, and for the strains, are fairly accurate. Even though the strain rates fall in the Hopkinson bar regime, the mechanism of dislocation motion appears to be dislocation drag, as is the case for stronger shock waves in Cu. DOE

A PRELIMINARY MODEL FOR CRACK-TIP HYDROGEN TRANSPORT

A. Turnbull, D. H. Ferriss, and H. Anzai Mar. 1993 48 p Sponsored by Dept. of Trade and Industry, London, England
(NPL-DMM(A)-84; ETN-93-94883) Copyright Avail: National Physical Laboratory, Teddington, Middlesex, TW11 0LW, United Kingdom

A preliminary analysis of the hydrogen concentration distribution at the tip of a crack as a basis for a more rigorous model leading to prediction of crack growth kinetics was carried out. The distinctive features are the use of a boundary fitted coordinate method for the numerical analysis and the adoption of flux boundary conditions at the crack tip and crack walls. At this stage of development, simple analytical expressions for the stress state were employed. Using limiting cases, the boundary fitted coordinate method was shown to give results comparable with boundary integral and finite element methods. Comparison of predictions of the hydrogen distribution at the crack tip from constant concentration and flux boundary conditions indicates that the latter should be adopted for application to low alloy steels, but equivalent results can be obtained for face centred cubic lattices because of the much lower lattice diffusivity. IMPACT MODELING WITH SMOOTH PARTICLE HYDRODYNAMICS

R. F. Stellingwerf and C. A. Wingate 1993 13 p Presented at the Smooth Particle Hydrodynamics in Astrophysics OAT Workshop, Trieste, Italy, 6 Jul. 1993
(Contract W-7405-eng-36)
(DE93-016561; LA-UR-93-2256; CONF-9307102-1) Avail: CASI HC A03/MF A01

Smooth Particle Hydrodynamics (SPH) can be used to model hypervelocity impact phenomena via the addition of a strength of materials treatment. SPH is the only technique that can model such problems efficiently due to the combination of three dimensional geometry, large translations of material, large deformations, and large void fractions for most problems of interest. This makes SPH an ideal candidate for modeling of asteroid impact, spacecraft shield modeling, and planetary accretion. In this paper we describe the derivation of the strength equations in SPH, show several basic code tests, and present several impact test cases with experimental comparisons. DOE

INTERPRETATION OF WARM PRESTRESS-INDUCED FRACTURE TOUGHNESS BASED ON CRACK-TIP CONSTRAINT

D. K. M. Shum 1993 18 p Presented at the 25th National Symposium on Fracture Mechanics, Bethlehem, PA, 29 Jun. - 1 Jul. 1993
(Contract DE-AC05-84OR-21400)
(DE93-015967; CONF-930695-1) Avail: CASI HC A03/MF A01

This study explores the possibility of using J-Q-related crack-tip constraint concepts to provide a basis for both the interpretation of warm prestress (WPS)-induced fracture toughness and their transferability to structural applications. A finite-element boundary-layer formulation based on small-scale yielding (SSY), remote mode I K-dominant assumptions is adopted. Effects of WPS-induced crack-tip constraint are quantified in terms of deviation in either the opening-mode or the mean stress component of the WPS crack-tip fields relative to the reference K-dominant SSY state associated with monotonic-loading conditions. Over the range of WPS load-paths considered the WPS-induced crack-tip constraint closely resembles a spatially varying hydrostatic stress field. Interpretation and transferability of WPS fracture toughness under SSY conditions are specified in terms of the unload and reload ratio. DOE

EXPERIMENTAL CONTRIBUTION TO THE CONTACT BETWEEN TWO BODIES AND THE EFFECT OF ROUGHNESS Ph.D. Thesis [CONTRIBUTION EXPERIMENTALE AU CONTACT ENTRE DEUX CORPS ET INFLUENCE DE LA RUGOSITE]

Alexandre Guinet 1991 130 p In FRENCH
(ECL-91-41; ETN-93-94587) Avail: CASI HC A07/MF A02

Some of the methods applied to measure surface topogaphy and the parameters which characterize the surface states at a microscopic scale are presented. These parameters are measured by statistical analysis and filtering techniques. Fractal geometry is applied to describe the surface mathematically. Rheological parameters and principles used in surface technologies are reviewed. In order to characterize the surface roughness, under given tangential forces and displacements, a sclerometric experiment was carried out. The Coulomb friction coefficient is shown to be affected by the surface anisotropy. Rough surfaces with cracks are modeled and validated. The model is applied to rough surfaces and the valleys are modeled by a notch on a thin plate. A film critical thickness, under which no crack propagation is possible, is defined. ESA

RATIO OF SPECIMEN THICKNESS TO DETECTION AREA FOR RELIABLE HYDROGEN PERMEATION MEASUREMENT

R. B. Hutchings, D. H. Ferriss, and A. Turnbull Jun. 1993 13 p
(NPL-DMM(A)-103; ETN-93-94886) Copyright Avail: National Physical Laboratory, Teddington, Middlesex, TW11 0LW, United Kingdom

Two dimensional diffusion of hydrogen atoms in a membrane was analyzed. The hydrogen atoms are assumed to be generated in a circular area on one side of the membrane and detected in a circular region on the opposite side. The average flux on the detection side was calculated as a function of membrane thickness and detection area and compared with the prediction from the conventional one dimensional solution. The applicability of the latter increases with decreasing thickness to detection area ratio. Recommendations are given for reliable utilization of the one dimensional analysis. ESA

INSTRUMENTED EXPERIMENTS ABOARD THE FRIGATE WOLF. WOLF 2: MEASUREMENT RESULTS OF THE 5.5 kg TNT IN THE CREW AFT SLEEPING COMPARTMENT Final Report

T. L. A. Verhagen and R. M. vandeKasteele Aug. 1992 68 p Original contains color illustrations
(Contract A88/KM/419)
(PML-1992-12; TD91-2526; ETN-93-94521) Copyright Avail: TNO Prins Maurits Laboratory, P.O. Box 45, 2280 AA Rijswijk, Netherlands

Within the framework of the research into the vulnerability of ships, an experimental investigation took place in 1989 aboard the frigate 'Wolf.' The recordings of an instrumented experiment in the crew aft sleeping compartment are presented. During this experiment, a nonfragmenting charge of 5.5 kg TNT was initiated. Preceding the 5.5 kg TNT experiment, a 2 kg TNT experiment was performed on the same day. Later that day the 15 kg TNT experiment took place. Reparation/modification of the instrumentation was not possible. The settings of the instrumentation equipment were based on the expected extreme responses of the 15 kg TNT experiment later that day which had, however, an influence on the signal to noise ratio. The blast measurements seem to have recorded correctly. The quasi static pressure in the experiment compartment as well as in the adjacent compartments showed classical behavior. The strain measurements seemed to be good, although some of them malfunctioned after a period of time. ESA

SCALING LAWS FOR DIFFRACTION LOADING BY AIR BLAST Final Report
E. A. Bakkum Jun. 1992 32 p Sponsored by TNO Defence Research, Delft, Netherlands
(PML-1991-54; TD91-2834; ETN-93-94520) Copyright Avail: TNO Prins Maurits Laboratory, P.O. Box 45, 2280 AA Rijswijk, Netherlands

An approximate scaling law for complex blast loadings was constructed. This blast loading together with the structural response is used to assess the damage, which is done to structures by an explosion. The blast loading in a model of a shelter was studied in the 40 by 40 sq cm blast simulator. The density distribution around the model was determined by means of flow visualization with a shearing interferometer. An approximate scaling law, which eliminates the dependency on the shock strength is proposed for the time behavior of the blast loading. The scaling law is confirmed by measurement of the density at various locations in the model for shock strengths of 6.5 kPa and 33.2 kPa. ESA

THE RESPECTIVENESS OF RESPONSE IN A BAR UNDER STATIC AND TRANSIENT LOADS [STAATTISEN JA TRANSIENTIN KUORMAN VASTEEN VERRANNOLLISUUS SAUVASSA]
Timo Kujala Jun. 1992 21 p In FINNISH
(VTT-TIED-1377; ISBN-951-38-4190-1; ETN-93-94479) Copyright Avail: CASI HC A03/MF A01

When responses of structures under impact load (in this case transient load) are evaluated pure statical analyses give too small values of displacements and stresses. In simple structures, under transient load, the displacements and stresses can be analyzed with analytical and numerical methods. In more complicated structures the Finite Element Method (FEM) will offer the way to solution. To verify different methods to analyze displacements and stresses of the bar caused by statical and transient loads, the Duhamel's integral and FEM were used. When solving Duhamel's integral Simpson's rule and superposition of eigenmodes were used at the same time. The direct time integration and superposition of eigenmodes were used separately for FEM analysis. In both FEM methods, the consistent mass matrix were used. Also, the suitability of numerical methods in doing 'impact' analyses were researched. In superposition of eigenvalues, the highest acceptable frequency determines the length of the time increment. Depending on the complexity of the structure, the choice of optimal element type and element mesh for an accurate solution might be difficult. Because in real structures any kind of elements have to be used, the bar was modeled by ten three dimensional solid elements. There were no remarkable differences between displacements and stresses caused by static and transient loads. ESA

SPECTRUM FATIGUE TESTING OF T-SHAPED TENSION CLIPS
Bjoern Palmberg and Bengt Wallstenius Dec. 1992 37 p
(Contract FMV/FFL-82250-90-276-16-001)
(FFA-TN-1992-22; ETN-93-94858) Avail: CASI HC A03/MF A01

An investigation of strain distributions during static loading and crack propagation and fatigue lives under spectrum loading of T-shaped tension clips was carried out. Three slightly different, with respect to geometry, T shaped tension clips made of aluminum alloy 7010-T73651 were studied. The type 1 and 4 test specimens were different only with respect to the web thickness of the clamping end. The type 1 and 2 test specimens were different with repect to milled flat circular countersink around the holes in the type 2 specimens and with respect to the radius between the web and foot. The spectrum fatigue loading consisted of a load sequence representative for the wing root, lower side, of a fighter aircraft. Tests were made at two different load levels for each specimen type. The strain measurements show that the countersink in the type 2 specimens increases the stresses in the fatigue critical region. This is also manifested in the spectrum fatigue life results, where type 2 specimens show the shortest fatigue lives. The strain measurements show that the torque used for the bolts in joining two test specimens or one test specimen and a dummy has a rather large impact on the strain in the fatigue region. The strains decrease with increasing torque. The spectrum fatigue loading resulted in approximately an equal number of flights to obtain a 10.0 mm crack for specimens of type 1 and 4. This suggests that the type 1 configuration is superior since the web thickness is smaller for this type as compared to the type 4 specimens. In other words, the type 4 specimens have an unnecessary oversize of the clamping end web thickness. ESA

MICROSTRUCTURALLY BASED THERMOMECHANICAL FATIGUE LIFETIME MODEL OF SOLDER JOINTS FOR ELECTRONIC APPLICATIONS
D. R. Frear, M. M. Rashid, and S. N. Burchett 1993 12 p Presented at the ASME Design Technical Conference, Albuquerque, NM, 9-19 Sep. 1993
(Contract DE-AC04-76DP-00789)
(DE93-016508; SAND-93-1181C; CONF-9309175-1) Avail: CASI HC A03/MF A01

We present a new methodology for predicting the fatigue life of solder joints for electronics applications. This approach involves integration of experimental and computational techniques. The first stage involves correlating the manufacturing and processing parameters with the starting microstructure of the solder joint. The second stage involves a series of experiments that characterize the evolution of the microstructure during thermal cycling. The third stage consists of a computer modeling and simulation effort that utilizes the starting microstructure and experimental data to produce a reliability prediction of the solder joint. This approach is an improvement over current methodologies because it incorporates the microstructure and properties of the solder directly into the model and allows these properties to evolve as the microstructure changes during fatigue. The beam and shell elements found in many linear elastic finite element codes accept integrated cross sectional properties as input, and produce solutions using classical beam and shell theory. These theories are built upon the equation of resultant forces and moments with integrals of assumed stress distributions over the cross section. In contrast, the structural elements in NIKE3D and DYNA3D are formulated to represent nonlinear geometric and material behavior. Thus stress distributions may not necessarily be representable by simple functions of cross section variables. In NIKE3D and DYNA3D, the Hughes-Liu beam element and all shell elements accommodate these more general stress distributions by computing stresses at various points in the cross section. The integration of stresses within each element is then performed numerically, using a variety of methods. This report describes these numerical integration procedures in detail, and highlights their application to engineering problems. Several other features of the structural elements are also described, including force and moment resultants, user-defined reference surfaces, and user-defined integration rules. Finally, the shear correction factor is described in a section which relates results from NIKE3D and DYNA3D to those obtained from classical beam theory. DOE

COMPUTATIONAL STRATEGIES FOR COMPOSITE STRUCTURES Thesis
J. C. J. Schellekens 1993 169 p
(PB93-195097; ISBN-90-9005673-4) Avail: CASI HC A08/MF A02

In the thesis the numerical tools are developed that can be applied to the analysis of composite structures at micro, meso, and macro-level. The study can be divided into three different parts: formulation of finite elements, constitutive modeling, and solution techniques. The proper combination of these numerical/mechanical aspects is essential for the accurate prediction of the nonlinear structural behavior of composites in the pre-failure and the post-failure regime. With respect to the description of structural failure the authors distinguish between discrete and continuous modeling of fracture. In the latter approach the fractured medium is considered as a continuum, whereas in a discrete description geometric discontinuities are introduced in the model once material failure occurs. NTIS

FACTORS WHICH AFFECT FATIGUE STRENGTH OF FASTENERS
G. W. Skochko and T. P. Herrmann Nov. 1992 19 p
(DE93-017272; MAO-PR-92-01) Avail: CASI HC A03/MF A01

Axial load cycling fatigue tests of threaded fasteners are useful in determining fastener fatigue failure or design properties. By using appropriate design factors between the failure and design fatigue strengths, such tests are used to establish fatigue failure and design parameters of fasteners for axial and bending cyclic load conditions. This paper reviews the factors which influence the fatigue strength of low alloy steel threaded fasteners, identifies those most significant to fatigue strength, and provides design guidelines based on the direct evaluation of fatigue tests of threaded fasteners. Influences on fatigue strength of thread manufacturing process (machining and rolling of threads), effect of fastener membrane and bending stresses, thread root radii, fastener sizes, fastener tensile strength, stress relaxation, mean stress, and test temperature are discussed. DEVELOPMENT AND APPLICATION OF SPECIALLY-FOCUSED ULTRASONIC TRANSDUCERS TO LOCATION AND SIZING OF DEFECTS IN 75 mm- TO 127 mm-THICK AUSTENITIC STAINLESS STEEL WELD METALS
E. N. C. Dalder, S. Benson, B. J. McKinley, and T. Carodiskey Aug. 1992 36 p Presented at the 2nd Symposium on Cyclic Deformation, Fracture, and Nondestructive Evaluation of Advanced Materials, Miami, FL, 16-17 Nov. 1992
(Contract W-7405-eng-48)
(DE93-015975; UCRL-JC-111577; CONF-9211134-2) Avail: CASI HC A03/MF A01

Special ultrasonic transducer (UT) parts, capable of focusing incident signals within a 25 mm x 25 mm x 25 mm volume in an austenitic stainless weld metal at depths that varied from 25 mm to 127 mm, were developed and demonstrated to be capable of detecting a defect with cross section equivalent to that of a 4.76 mm-dia flat-bottom hole. Defect length sizing could be accomplished to +/- 50% for 100% of the time and to +/- 25% on selected defect types as follows: porosity groups, 100%; cracks, 67%; combined slag and porosity, 60%; and linear slag indications, 59%. Extensive linear elastic-fracture mechanics analyses were performed to establish allowable defect sizes at functions of stress based on a cyclic-life criterion of 10(exp 3) full power cycles of the MFTF-B magnet system. These defect sizes were used to determine which UT indicating were to be removed and repaired and which were to be retained and their recorded sizes and locations. DOE

A PROBABILITY METHOD OF FRACTURE MECHANICS ANALYSIS FOR HFIR VESSEL
Shih-Jung Chang 1993 33 p Presented at the Pressure Vessels and Piping Conference, Denver, CO, 25-29 Jul. 1993
(Contract DE-AC05-84OR-21400)
(DE93-015510; CONF-930702-42) Avail: CASI HC A03/MF A01

A preliminary estimate is made on the dynamic strength of the HFIR pressure vessel to resist internal explosive pulses of hypothetical accidents. The effect of fluid-structure interaction and radiation embrittlement are both taken into consideration. The pressure pulse is applied at the center of the fluid volume enclosed within the vessel. The vessel is located within a pool of water. The effect of the pool of water on the vessel response is considered in this calculation. Dynamic stress components at several locations along the vessel wall as functions of time are calculated. The material of the vessel has been assumed to be either elastic or elastic-plastic. The vessel failure is determined both by the location of maximum stress and by the arrival time of the stress-pulse. The capability that the pressure vessel may not break under the hypothetical accident is analyzed by the method of linear elastic fracture mechanics. The possible crack sizes are based on an assumed probability distribution function. Fracture condition under a single crack is estimated first. The probability of vessel fracture with multiple number of cracks is then obtained as a function of the applied hoop stress. The probability of fracture function is assumed to follow a lognormal distribution and the probability of fracture is extended to include different levels of confidence and variability. It, therefore, enables one to estimate the high confidence and low probability fracture capacity of the reactor vessel under a range of accident loading conditions. DOE

SEVERAL FUNDAMENTAL ISSUES IN THE MECHANICS OF INELASTIC BEHAVIOR
14 Sep. 1993 4 p
(Contract N00014-87-J-1193)
(AD-A269455) Avail: CASI HC A01/MF A01

This is the final report for the support of research that began in 1987 and continued through to 1993 with a three year no additional cost extension. The International Symposium on Plasticity and its Current Applications was held in Baltimore on 19-23 Jul., and I presented two papers that summarized my endeavor's under ONR sponsorship. One was an extension of my earlier published work (Lee Anniversary Volume) on the microstructural features that control the flow strength of ductile metals and alloys. The other was an explanation of why, in a useful constitutive relation, it is necessary to define a plastic strain rate or increment that is not the rate of change or increment of whatever quantity may appeal to an author as an appropriate measure of finite plastic strain. Such a definition mirrors the accepted and necessary usage in fluid mechanics of the rate of deformation, a quantity which does not integrate over time to the finite deformation of the fluid. DTIC

ANALYSIS OF BOLTED AND BONDED COMPOSITE Interim Report, May 1991 - Jun. 1992
Seng C. Tan Sep. 1992 190 p Limited Reproducibility: Document partially illegible
(Contract F33615-89-C-5643)
(AD-A267792; UDR-TR-92-120; WL-TR-92-4084) Avail: CASI HC A09/MF A02

In the analysis and design of bonded and bolted composite joints, certain input data are required that are not readily available. Many engineering hours at the depots are expended in obtaining the required information. Even when the data are obtained, the accuracy of it is sometimes questionable. The availability of this information in a computerized database would greatly facilitate composite joint analysis and design. The work described in this report involved an extensive search of the technical literature for adhesive and composite material property data as well as bonded and bolted joint properties. The data collected in the literature search were tabulated into a user friendly format for ready retrieval. The data in this tabulation include, in addition to material properties, discussions of fastener and joint design parameters, loading and environmental effects, and test methods. DTIC

THE LONGITUDINAL FREE VIBRATIONS OF A FIXED-FREE TWO-PHASE ELASTIC BAR
Jim M. Restuccio Jun. 1993 30 p

(Contract N00014-90-J-1871)
(AD-A268768; TR-14) Avail: CASI HC A03/MF A01

In this paper, the longitudinal free vibrations of a fixed-free bar are studied. It is assumed that the bar initially consists of two phases, one of which was obtained from the other by a martensitic phase transformation. It is also assumed that both phases of the bar have elastic constitutive behavior. For a bar that consists entirely of one phase that behaves elastically, it is well known that during the free vibrations of the bar the displacement and stress at each point of the bar oscillate as time progresses. If there is damping present, these oscillations will decay and go to zero as time goes to infinity, otherwise their amplitudes will remain constant in time. Considering this, for a bar that initially consists of two different phases that both behave elastically, one might expect that the displacement and stress at each point of the bar will also have oscillatory-type behavior during the free vibrations of the bar. If this is the case, the driving traction at the interface separating the two phases will oscillate. As a result of this, if the nominal phase boundary velocity is related to the driving traction through a kinetic relation that does not have an interval of the driving traction corresponding to a zero nominal phase boundary velocity, the nominal phase boundary velocity will also oscillate. Since energy is dissipated when the phase boundary moves and passes over particles of material of one phase converting them into particles of material of the other phase, one might conclude that the oscillatory-type response of the two-phase bar during the free vibrations of the bar should decay as time increases. This damping behavior of the two-phase bar is discussed. DTIC

INITIATION AND GROWTH OF MICROCRACKS IN HIGH STRENGTH STEEL BUTT WELDS M.S. Thesis
Edward Olsen May 1993 185 p
(Contract N00123-89-G-0580)
(AD-A268751) Avail: CASI HC A09/MF A02

Early tests such as the explosion bulge test created a preference for overmatched welds (welds which are stronger than the base metal) which eventually became codified for many structural applications. While an overmatched system offers advantages such as the shedding of strain to the base plate, it requires the use of expensive fabrication procedures to avoid cracking. Undermatched welding of some high strength steels may offer reductions in welding costs with little sacrifice in weld performance or low cycle fatigue integrity. An experimental study was carried out to observe microcrack initiation and growth of overmatched and undermatched butt welded high strength steel samples using globally elastic low cycle fatigue testing. First, 1 inch thick HY-80 and HY-100 base plates were multipass, spray gas metal arc welded (GMAW) with overmatching and undermatching filler metal using a semiautomatic welding machine. Second, 1/4 inch thick MIL-A-46100 high hardness armor plates (HHA) were manually, two pass spray GMAW welded with two grades of undermatching consumables. Weld reinforcements were removed from all HY specimens and six HHA specimens. All specimens had a crack initiator slit machined in the test section. The specimens were fatigue tested by transverse tensile loading with a 12 to 13 Hz tension-tension profile. The loading range was from 10% to 85% of the tensile strength of the HY steel base plate and HHA weld metal respectively. Crack initiation and propagation was observed in situ using a confocal scanning laser microscope. DTIC

MECHANICAL PROPERTIES OF FIBER-REINFORCED YBa2Cu3O(x) AND Bi2Sr2CaCu2O(x) BARS
K. C. Goretta, L. J. Martin, D. Singh, R. B. Poeppel, Nan Chen, C. Y. Chu, J. C. Routbort, and R. A. Gleixner (Babcock and Wilcox Co., Alliance, OH.) Jul. 1993 9 p Presented at the International Cryogenic Engineering Conference and International Cryogenic Materials Conference, Albuquerque, NM, 12-16 Jul. 1993
(Contract W-31-109-eng-38)
(DE93-017689; ANL/ET/CP-78558; CONF-930703-10) Avail: CASI HC A02/MF A01

Strength in four-point bending and fracture toughness of YBa2Cu3O(x) (123) and Bi2Sr2CaCu2O(x) (2212) were examined at room temperature. The 123 was reinforced with 15 vol.% Y2BaCuO5 (211) fibers and was processed to 90-91% density by cold pressing and sintering. The 2212 was reinforced with 15 vol.% 2212 fibers and was processed to approximately 90% density by sinter forging. The 123/211 composites had a fracture toughness of 1.9 MPa(m)(exp 0.5), which is 20-30% higher than that of corresponding monoliths, but exhibited no improvement in strength. The strength and fracture toughness of the 2212/2212 composites were 102 MPa and 2.7 MPa(m)(exp 0.5), respectively, which were slight improvements over the monoliths. Transport critical current densities at 77 K were only slightly affected by the fiber additions. DOE

FUNDAMENTAL RESEARCH IN NONLINEAR RANDOM VIBRATION FOR AEROSPACE APPLICATIONS Final Report, 15 Nov. 1991 - 14 Nov. 1992
Y. K. Lin 11 Jan. 1993 22 p
(Grant AF-AFOSR-0073-91)
(AD-A268929; AFOSR-93-0666TR) Avail: CASI HC A03/MF A01

Response and safety of nonlinear structures under random excitations are investigated. The excitations can be either external, or parametric, or both. Extensions are made along two directions from the earlier works on exact solutions when the excitations are Gaussian white noises: (1) the excitations are impulsive, but non-Gaussian; and (2) the system does not belong to the class of generalized stationary potential, thus, exact solution is not obtainable at the present time. In the first case, the probability density of the structural response is governed by a partial differential equation, with infinite number of terms. A perturbation analysis is devised to obtain approximate solutions. In the second case, a new technique is developed to obtain approximate solutions on the principle of weighted residuals. On the issues of structural safety, two failure modes are investigated: catastrophic failure and fatigue failure. Catastrophic failure occurs when structural response exceeds, for the first time, a critical limit. Fatigue failure is investigated from a fracture mechanics point of view, namely, failure is assumed to occur when a dominant crack is propagated to a critical size. DTIC

WAVELET TRANSFORM FOR TIME-FREQUENCY ANALYSIS OF THE VIBRATIONAL SIGNATURE AND ITS APPLICATION
Jae-Jin Jeon and Young S. Shin 17 Aug. 1993 68 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A269928; NPS-ME-93-004) Avail: CASI HC A04

Wavelet transform is applied to the analysis of vibration signatures in order to verify the ability of the detection of abnormal condition. It can well describe the dynamics of the signal's spectral composition of a non-stationary and stationary signal to be measured and presented in the form of 3-D time-frequency map. Although wavelet has been developed over about ten years in the mathematics and physics, its engineering applications is a first stage. The objective of this report outlines the definition of the wavelet transform and is to discuss the properties of the wavelet transform as new tool for the vibration analysis, and then demonstrates how it may be applied to the machinery condition monitoring. DEVELOPMENT OF THE MICROSTRUCTURE BASED STOCHASTIC LIFE PREDICTION MODELS
Marek A. Przystupa, Jimin Zhang, and Annetta J. Luevano Sep. 1993 26 p
(Contract N00014-91-J-1299)
(AD-A269880) Avail: CASI HC A03/MF A01

The microstructural features of 7050 T7451 aluminum alloy in the vicinity of fatigue cracks and on the crack path were studied to determine which of them influence fatigue crack propagation. The studies included characterization of the full spectrum of microstructural and fracture surface features starting from the largest ones such as roughness and grain type to the smallest such as second phase particles and dislocations. Of all the features studied, only the second phase particles were shown to have a definite influence by causing crack deflection. The number of particles encountered by the fatigue cracks were significantly higher than the expected average. The fatigue crack path was predominately transgranular and there was no changes in the dislocation and precipitation structures in the crack affected zone. DTIC

DEVELOPMENT OF THE MICROSTRUCTURE BASED STOCHASTIC LIFE PREDICTION MODELS Annual Report

M. A. Przystupa and A. K. Vasudevan 1993 4 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-91-J-1299)
(AD-A270453) Avail: CASI HC A01

This study explores the methods of incorporating material microstructural characteristics into the fatigue life prediction models based on the results of the microstructural characterizations and fatigue testing of aluminum 7050-T7451 plate alloys. The emphases in the microstructural characterization part of the program are on the identification of the fatigue-relevant microstructural features and on the characterizations of the microstructural gradients. The characterizations are carried out using both the standard and novel techniques such as tessellation, fractal and modified linear intercept methods. The key measurement is determination of the size distributions of the fatigue crack initiating flaws -- they are assumed equal to the extreme value distributions of the micropore and/or constituent particle size distributions measured on the metallographic sections. FATIGUE TECHNOLOGY ASSESSMENT AND STRATEGIES FOR FATIGUE AVOIDANCE IN MARINE STRUCTURES. APPENDICES Final Report

Cuneyt C. Capanoglu 1993 191 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DTCG23-88-C-20029)
(AD-A269053; SR-1324-App) Avail: CASI HC A09

This report provides an up-to-date assessment of fatigue technology, directed specifically toward the marine industry. A comprehensive overview of fatigue analysis and design, a global review of fatigue including rules and regulations and current practices, and a fatigue analysis and design criteria are provided as a general guideline to fatigue assessment. A detailed discussion of all fatigue parameters is grouped under three analysis blocks: fatigue stress model, covering environmental forces, structure response and loading, stress response amplitude operations (RAO's) and hot-spot stresses; fatigue stress history model covering long-term distribution of environmental loading; and fatigue resistance of structures and damage assessment methodologies. The analyses and design parameters that affect fatigue assessment are discussed together with uncertainties and research gaps, to provide a basis for developing strategies for fatigue avoidance. Additional in-depth discussions of wave environment, stress concentration factors, etc. are presented in the appendixes. Assessment of fatigue technology, fatigue stress models, fatigue stress history models, fatigue resistance, fatigue parameters, and fatigue avoidance strategies. DTIC

THREE-DIMENSIONAL SHOCK WAVE PHYSICS SIMULATIONS WITH MIMD PAGOSA ON MASSIVELY PARALLEL COMPUTERS

D. R. Gardner, C. T. Vaughan, and D. D. Cline (Texas Univ., Austin.) 1992 5 p Presented at the Summer Computer Simulation Conference, Boston, MA, 19-21 Jul. 1993
(Contract DE-AC04-76DP-00789)
(DE93-011682; SAND-92-2825C; CONF-930765-3) Avail: CASI HC A01/MF A01

The numerical modeling of penetrator-armor interactions for design studies requires rapid, detailed, three-dimensional simulation of complex interactions of exotic materials at high speeds and high rates of strain. To perform such simulations, we have developed a multiple-instruction, multiple-data (MIMD) version of the PAGOSA hydrocode. The code includes a variety of models for material strength, fracture, and the detonation of high explosives. We present a typical armor/antiarmor penetration simulation conducted with this code, and measurements of its performance. The scaled speedups for MIMD PAGOSA on the 1024-processor nCUBE 2 parallel computer, measured as the simulation size is increased with the number of processors, reveal that small grind times (computational time per cell per cycle) and parallel scaled efficiencies of 90% can be achieved for realistic problems. This simulation demonstrates that massively parallel hydrocodes can provide rapid, highly-detailed armor/antiarmor simulations. DOE

TOWARD A CHARACTERIZATION OF THE DEBRIS CLOUD CREATED IN A HYPERVELOCITY IMPACT ON A THIN PLATE Final Report, Sep. 1992 - Mar. 1993

William P. Schonberg Aug. 1993 113 p
(Contract F49620-90-C-0076)
(AD-A269190; WL-TR-93-7028) Avail: CASI HC A06/MF A02

Semi-analytical lethality assessment models fall into one of two general categories: discrete particle models and expanding shell models. Discrete particle models account for and track only a small number of solid fragments in a debris cloud generated by a hypervelocity impact. They are best suited for impact scenarios in which melting and/or vaporization of the projectile and target materials do not occur. Expanding shell models assume that all of the debris cloud material is homogeneously distributed over a uniformly expanding spherical shell in those impact scenarios where melting and/or vaporization of the projectile and target materials do occur. A lethality assessment model that considers the creation and subsequent effects of debris clouds containing all three states of matter is needed. This report describes the results of an investigation into the composition of the material in a debris cloud generated by a hypervelocity projectile impact. The work completed represents the first step in a long-term research program whose overall objective is to develop a general model of the response of a target structure to a hypervelocity impact over the 4-16 kilometers per second impact regime. SHOCK-LOADING RESPONSE OF ADVANCED MATERIALS

G. T. Gray, III 1993 5 p Presented at the 14th International Conference of the International Association for the Advancement of High Pressure Science and Technology, Colorado Springs, CO, 27 Jun. - 2 Jul. 1993
(Contract W-7405-eng-36)
(DE93-018344; LA-UR-93-2291; CONF-930676-16) Avail: CASI HC A01/MF A01

Advanced materials, such as composites (metal, ceramic, or polymer-matrix), intermetallics, foams (metallic or polymeric-based), laminated materials, and nanostructured materials are receiving increasing attention because their properties can be custom tailored specific applications. The high-rate/impact response of advanced materials is relevant to a broad range of service environments such as the crashworthiness of civilian/military vehicles, foreign-object-damage in aerospace, and light-weight armor. Increased utilization of these material classes under dynamic loading conditions requires an understanding of the relationship between high-rate/shock-wave response as a function of microstructure if we are to develop models to predict material behavior. In this paper, the issues relevant to defect generation, storage, and the underlying physical basis needed in predictive models for several advanced materials are reviewed. DOE

A GENERAL-PURPOSE CONTACT DETECTION ALGORITHM FOR NONLINEAR STRUCTURAL ANALYSIS CODES

M. W. Heinstein, S. W. Attaway, J. W. Swegle, and F. J. Mello May 1993 98 p
(Contract DE-AC04-76DP-00789)
(DE93-018507; SAND-92-2141) Avail: CASI HC A05/MF A02

A new contact detection algorithm has been developed to address difficulties associated with the numerical simulation of contact in nonlinear finite element structural analysis codes. Problems including accurate and efficient detection of contact for self-contacting surfaces, tearing and eroding surfaces, and multi-body impact are addressed. The proposed algorithm is portable between dynamic and quasi-static codes and can efficiently model contact between a variety of finite element types including shells, bricks, beams, and particles. The algorithm is composed of a location strategy that uses a global search to decide which slave nodes are in proximity to a master surface and an accurate detailed contact check that uses the projected motions of both master surface and slave node. In this report, currently used contact detection algorithms and their associated difficulties are discussed. Then the proposed algorithm and how it addresses these problems is described. Finally, the capability of the new algorithm is illustrated with several example problems. DOE

A PARTICLE METHOD FOR HISTORY-DEPENDENT MATERIALS
Deborah Sulsky (New Mexico Univ., Albuquerque.), Zhen Chen (New Mexico Univ., Albuquerque.), and Howard L. Schreyer (New Mexico Univ., Albuquerque.) Jun. 1993 33 p
(Contracts DE-AC04-76DP-00789)
(DE93-018696; SAND-93-7044) Avail: CASI HC A03/MF A01

A broad class of engineering problems including penetration, impact, and large rotations of solid bodies causes severe numerical problems. For these problems, the constitutive equations are history dependent so material points must be followed; this is difficult to implement in an Eulerian scheme. On the other hand, purely Lagrangian methods typically result in severe mesh distortion and the consequence is ill-conditioning of the element stiffness matrix leading to mesh lockup or entanglement. Remeshing prevents the lockup and tangling but then interpolation must be performed for history dependent variables, a process which can introduce errors. Proposed here is an extension of the particle-in-cell method in which particles are interpreted to be material points that are followed through the complete loading process. A fixed Eulerian grid provides the means for determining a spatial gradient. Because the grid can also be interpreted as an updated Lagrangian frame, the usual convection term in the acceleration associated with Eulerian formulations does not appear. With the use of maps between material points and the grid, the advantages of both Eulerian and Lagrangian schemes are utilized so that mesh tangling is avoided while material variables are tracked through the complete deformation history. Example solutions in two dimensions are given to illustrate the robustness of the proposed convection algorithm and to show that typical elastic behavior can be reproduced. Also, it is shown that impact with no slip is handled without any special algorithm for bodies governed by elasticity and strain hardening plasticity. DOE

STRESS PULSE PHENOMENA
M. McGlaun 1993 6 p Presented at the Los Alamos Technology Exchange Workshop on Dynamic Response of Materials to Pulsed Heating, Los Alamos, NM, 22-25 Jan. 1993
(Contract DE-AC04-76DP-00789)
(DE93-019064; SAND-93-1661C; CONF-9301125-2) Avail: CASI HC A02/MF A01

This paper is an introductory discussion of stress pulse phenomena in simple solids and fluids. Stress pulse phenomena is a very rich and complex field that has been studied by many scientists and engineers. This paper describes the behavior of stress pulses in idealized materials. Inviscid fluids and simple solids are realistic enough to illustrate the basic behavior of stress pulses. Sections 2 through 8 deal with the behavior of pressure pulses. Pressure is best thought of as the average stress at a point. Section 9 deals with shear stresses which are most important in studying solids. DOE

A COMPARATIVE EVALUATION OF IN-PLANE SHEAR TEST METHODS FOR LAMINATED GRAPHITE-EPOXY COMPOSITES Final Report, Sep. 1989 - Dec. 1991
John Morton and Henjen Ho 30 Jun. 1992 6 p
(Grant NAG1-1053)
(NASA-CR-193808; NAS 1.26:193808) Avail: CASI HC A02/MF A01

The objectives were to evaluate popular shear test methods for various forms of graphite-epoxy composite materials and to determine the shear response of graphite-epoxy composites with various forms of fiber architecture. Numerical and full-field experimental stress analyses were performed on four shear test configurations for unidirectional and bidirectional graphite-epoxy laminates to assess the uniformity and purity of the shear stress (strain) fields produced in the specimen test section and to determine the material in-plane shear modulus and shear response. The test methods were the 10 deg off-axis, the +/- 45 deg tension, the Iosipescu V-notch, and a compact U-notch specimen. Specimens were prepared from AS4/3501-6 graphite-epoxy panels, instrumented with conventional strain gage rosettes and with a cross-line moire grating, and loaded in a convenient testing machine. The shear responses obtained for each test method and the two methods of specimen instrumentation were compared. In a second phase of the program the shear responses obtained from Iosipescu V-notch beam specimens were determined for woven fabric geometries of different weave and fiber architectures. Again the responses of specimens obtained from strain gage rosettes and moire interferometry were compared. Additional experiments were performed on a bidirectional cruciform specimen which was also instrumented with strain gages and a moire grating. Author (revised)

INTERFACIAL CRACKS IN PLATES: A THREE-DIMENSIONAL NUMERICAL INVESTIGATION
Yeong Joo Lee and A. J. Rosakis 1992 44 p Original contains color illustrations
(Contract N00014-90-J-1340; NSF MSS-90-24838)
Avail: CASI HC A03/MF A01; 1 functional color page

The 3-D field at a crack front in a bimaterial interface is investigated in order to identify relevant fracture parameters in thin plate laboratory specimens. Existence of plane stress K-dominance is necessary for the proper analysis of experimental data, which can be obtained directly from the crack tip field by optical methods. The analysis of the 3-D structure of the crack tip field presented here is performed in relation to the three-point bend specimen geometry used in the experiments described in Lee and Rosakis. It is well known that the 3-D field at the vicinity of a crack in a plate composed of a homogeneous material extends over a half plate thickness from the crack front. However, in a bimaterial fracture specimen, in addition to the singular field at the crack tip, mismatch of material properties along the interface induces a 3-D strip along the bimaterial interface ahead of the crack tip. The extent of the 3-D zone and a critical discussion of the zone of K-dominance are presented. The relation-between the stress intensity factors in the remote plane stress K-field and the stress intensity factors inside the near-tip plane strain K-field is also derived by means of a separate boundary-layer type of numerical analysis. Finally, a means of scaling the results obtained by experimentation in thin plate specimens of a specific thickness to plate specimens of any thickness is proposed. Author (revised)

THE INTERPRETATION OF OPTICAL CAUSTICS IN THE PRESENCE OF DYNAMIC NON-UNIFORM CRACK-TIP MOTION HISTORIES: A STUDY BASED ON A HIGHER ORDER TRANSIENT CRACK-TIP EXPANSION
Cheng Liu, Ares J. Rosakis, and L. B. Freund Nov. 1991 54 p
(Contract N00014-90-J-1340)
(SM91-12) Avail: CASI HC A04/MF A01

The optical method of caustics is re-examined by considering the presence of dynamic nonuniform crack tip motion histories. Based on the higher order transient expansion obtained by Freund and Rosakis (1990, 1991) and Rosakis, Liu, and Freund (1991), in which dynamic transient

effects were included in the near tip deformation field, the exact mapping equations of caustics are derived for nonuniformly propagating cracks. The resulting equations indicate that the classical analysis of caustics based on the assumption of K(sup d)(sub I) dominance, is inadequate to interpret the experimental caustic patterns when dynamic transient effects become significant. In this paper, an explicit relation between the instantaneous value of the dynamic stress intensity factor K(sup d)(sub I)(t) and the geometrical characteristics of the caustic is established. This relation shows that for the case of nonuniformly propagating cracks, the relation between the dynamic stress intensity factor, and the geometrical characteristics of the caustic pattern depends on the crack tip acceleration and on K(sup d)(sub I)(t). It also reduces to the classical relation between K(sup d)(sub I)(t) and the caustic diameter for the case of K(sup d)(sub I)-dominance (when the crack tip fields are well described by the r exp -1/2 singularity in stresses). The Broberg problem is used as an example problem to check the feasibility of analyzing caustics in the presence of higher order transient terms. It is shown the value of the dynamic stress intensity factor obtained by the proposed method agrees remarkably well with the exact analytical value while large errors are introduced when the classical analysis (K(sup d)(sub I)-dominant) of the method of caustics is used.

INFLUENCE OF PEAK PRESSURE AND TEMPERATURE ON THE SHOCK-LOADING RESPONSE OF TANTALUM
G. T. Gray, III 1993 5 p Presented at the 14th International Conference of the International Association for the Advancement of High Pressure Science and Technology, Colorado Springs, CO, 27 Jun. - 2 Jul. 1993
(Contract W-7405-eng-36)
(DE93-018561; LA-UR-93-2214; CONF-930676-33) Avail: CASI HC A01/MF A01

While the deformation response of tantalum subjected to high-rate loading has attracted considerable study, few studies have systematically investigated the influence of peak shock pressure and starting temperature on the shock response of tantalum. In this study the deformation behavior of annealed tantalum has been compared to tantalum shock pre-strained to 7 and 15 GPa at 250 C as well as to 7 GPa after first preheating to 200 and 400 C. The reload yield behavior of shock prestrained Ta was found to exhibit no enhanced shock hardening compared to Ta deformed quasi-statically or dynamically to an equivalent strain level. In addition the reload yield behavior of Ta shock prestrained to 7 GPa at 200 or 400 C was found to exhibit increased hardening compared to the shock prestraining at 25 C. The shock-hardening response of Ta is discussed in terms of defect storage and compared to that seen in fcc metals. DOE

The application of the computer code IPACS (Integrated Probabilistic Assessment of Composite Structures) to aircraft wing type structures is described. The code performs a complete probabilistic analysis for composites taking into account the uncertainties in geometry, boundary conditions, material properties, laminate lay-ups, and loads. Results of the analysis are presented in terms of cumulative distribution functions (CDF) and probability density function (PDF) of the fatigue life of a wing type composite structure under different hygrothermal environments subjected to the random pressure. The sensitivity of the fatigue life to a number of critical structural/material variables is also computed from the analysis.

CONSTRUCTION OF A TENSION-TORSION ANISOTROPIC BRITTLE DAMAGE ELASTIC MODEL Ph.D. Thesis [CONSTRUCTION D'UN MODELE ELASTIQUE FRAGILE ANISOTROPE ENDOMMAGE EN TRACTION-TORSION]
Mahmoud Ketata 1991 130 p In FRENCH
(ECL-91-27; ETN-93-94585) Avail: CASI HC A07/MF A02

The behavior of concrete can be described in the first approximation by a brittle damaged elastic model. This model presents an induced anisotropy which depends on loading path. A second order symmetric tensor D is used to represent the anisotropic evolution of damage. A model based on effective stresses is applied for a tension-torsion load. Having a symmetric law either in tension and compression leads to consider other forms of effective stresses which contain the sign of principal stresses and another scalar variable of damage d, so that the damage acts differently in tension and in compression loads. (ECL-92-64; ETN-93-94895) Avail: CASI HC A11/MF A03

Methods of nonlinear identification, which are based on nonparametrical technique are discussed. New strategies allowing strong nonlinearities are taken into account in a multidimensional context. The problem of identification is analyzed by the following methods: nonparametrical, Volterra series and the NARMAX (nonlinear autoregressive moving average with exogeneous inputs) method. These methods are applied together with an analytical tool so that they may have an analytical function in the nonlinear phenomens. The possibilities and the limits of every method on numerical examples are shown. The methods are applied to real structures by using nonlinear dampers as well as localized nonlinearities. ESA

CONTRIBUTION TO THE IDENTIFICATION OF NONLINEAR BEHAVIOR LAWS IN MATERIAL MECHANICS Ph.D. Thesis [CONTRIBUTION A L'IDENTIFICATION DES LOIS DE COMPORTEMENT NON LINEAIRES EN MECANIQUE DES MATERIAUX]
Bachir Lamani 1992 200 p In FRENCH
(ECL-92-36; ETN-93-94593) Avail: CASI HC A09/MF A03

Tools specific to the identification of nonlinear behavior are considered taking the following into account: identification is an essential step in the development of a constitutive model; in view of the model's structure, this step remains often empirical. A parameter, which is essential to the modeling, the elasticity limit, is identified. With this in view the use of the Houg transform, a method stemming from picture processing techniques, is suggested. The identification of component functions is then taken into account. For this, traditional optimization methods are used. Several applications which were carried out from examples on the plasticity of metals and soils are presented. Forming problems are identified. These applications enable the different methods used to be assessed. ESA

REANALYSIS OF STRUCTURE MODELS Ph.D. Thesis [RECALAGE DES MODELES DE BATIMENT]
Bambang Supriyadi 1993 169 p In FRENCH
(ECL-93-07; ETN-93-94898) Avail: CASI HC A08/MF A02

The purpose of the study is to develop a software to optimize structural models and describe as accurately as possible real structures. A method, named sensibility method, which allows estimating the structure's dynamical behavior sensibility to changes is applied. The first and second derivatives of eigenfrequencies and the first derivative of eigenvectors are calculated. The models chosen to describe the dynamic-characteristics are based on the modeling of three dimensional structural beams. Efforts were made to determine the equivalent real characteristics of those structures. The analysis shows that the vibrational behavior of the model is relatively far from the behavior of real structures. ESA

ADAPTIVE METHODS FOR NONLINEAR STRUCTURAL DYNAMICS AND CRASHWORTHINESS ANALYSIS
Ted Belytschko *In* NASA. Langley Research Center, Computational Methods for Crashworthiness Aug. 1993 p 7-35 (For primary document see N94-19465 04-39)
Avail: CASI HC A03/MF A03

The objective is to describe three research thrusts in crashworthiness analysis: adaptivity; mixed time integration, or subcycling, in which different timesteps are used for different parts of the mesh in explicit methods; and methods for contact-impact which are highly vectorizable. The techniques are being developed to improve the accuracy of calculations, ease-of-use of crashworthiness programs, and the speed of calculations. The latter is still of importance because crashworthiness calculations are often made with models of 20,000 to 50,000 elements using explicit time integration and require on the order of 20 to 100 hours on current supercomputers. The methodologies are briefly reviewed and then some example calculations employing these methods are described. The methods are also of value to other nonlinear transient computations. COMPOSITE IMPACT DYNAMICS RESEARCH AT NASA LARC: A REVIEW
Huey D. Carden *In its* Computational Methods for Crashworthiness Aug. 1993 p 37-64 (For primary document see N94-19465 04-39)
Avail: CASI HC A03/MF A03

The Landing and Impact Dynamics Branch of NASA Langley Research Center has been involved in impact dynamics research since the early 1970's. For the first ten years, the emphasis of the research was on metal aircraft structures in both the General Aviation Crash Dynamics Program and the Controlled Impact Demonstration (CID) Program, a transport aircraft program culminating in the controlled crash test of a Boeing 720 aircraft in 1984. Subsequent to the transport work, the emphasis has been on composite structures with efforts directed at understanding the behavior, responses, failure mechanisms, and general loads associated with the composite material systems under crash type loadings. Considerable work has been conducted to address the energy absorption characteristics and it indicates that composites can absorb as much if not considerably more energy than comparable aluminum structures. However, due to their brittle nature, attention must be given to proper geometry and designs to take advantage of the good energy absorbing properties while providing desired structural integrity. Achieving the desired new designs often requires an understanding of how more conventional designs behave under crash type loadings. The purpose is to present a review of the composite impact dynamics research being conducted at NASA Langley Research Center. Examples are presented of experimental and analytical data to illustrate the activities in the four program elements of the composite research.

DEVELOPMENT AND USE OF COMPUTATIONAL TECHNIQUES IN ARMY AVIATION RESEARCH AND DEVELOPMENT PROGRAMS FOR CRASH RESISTANT HELICOPTER TECHNOLOGY
LeRoy T. Burrows *In* NASA. Langley Research Center, Computational Methods for Crashworthiness Aug. 1993 p 95-104 (For primary document see N94-19465 04-39)
Avail: CASI HC A02/MF A03

During the 1960's over 30 full-scale aircraft crash tests were conducted by the Flight Safety Foundation under contract to the Aviation Applied Technology Directorate (AATD) of the U.S. Army Aviation Systems Command (AVSCOM). The purpose of these tests were to conduct crash injury investigations that would provide a basis for the formulation of sound crash resistance design criteria for light fixed-wing and rotary wing aircraft. This resulted in the Crash Survival Design Criteria Designer's Guide which was first published in 1967 and has been revised numerous times, the last being in 1989. Full-scale aircraft crash testing is an expensive way to investigate structural deformations of occupied spaces and to determine the decelerative loadings experienced by occupants in a crash. This gave initial impetus to the U.S. Army to develop analytical methods to predict the dynamic response of aircraft structures in a crash. It was believed that such analytical tools could be very useful in the preliminary design stage of a new helicopter system which is required to demonstrate a level of crash resistance and had to be more cost effective than full-scale crash tests or numerous component design support tests. From an economic point of view, it is more efficient to optimize for the incorporation of crash resistance features early in the design stage. However, during preliminary design it is doubtful if sufficient design details, which influence the exact plastic deformation shape of structural elements, will be available. The availability of simple procedures to predict energy absorption and load-deformation characteristics will allow the designer to initiate valuable cost, weight, and geometry tradeoff studies. The development of these procedures will require some testing of typical specimens. This testing should, as a minimum, verify the validity of proposed procedures for providing pertinent nonlinear load-deformation data. It was hoped that through the use of these analytical models, the designer could optimize aircraft design for crash resistance from both a weight and cost increment standpoint, thus enhancing the acceptance of the design criteria for crash resistance. EXPLICIT SOLUTION TECHNIQUES FOR IMPACT WITH CONTACT CONSTRAINTS
Robert E. McCarty *In* NASA. Langley Research Center, Computational Methods for Crashworthiness Aug. 1993 p 105-123 (For primary document see N94-19465 04-39)
Avail: CASI HC A03/MF A03

Modern military aircraft transparency systems, windshields and canopies, are complex systems which must meet a large and rapidly growing number of requirements. Many of these transparency system requirements are conflicting, presenting difficult balances which must be achieved. One example of a challenging requirements balance or trade is shaping for stealth versus aircrew vision. The large number of requirements involved may be grouped in a variety of areas including man-machine interface; structural integration with the airframe; combat hazards; environmental exposures; and supportability. Some individual requirements by themselves pose very difficult, severely nonlinear analysis problems. One such complex problem is that associated with the dynamic structural response resulting from high energy bird impact. An improved analytical capability for soft-body impact simulation was developed. Author (revised)

NUMERICAL SIMULATION OF VEHICLE CRASHWORTHINESS AND OCCUPANT PROTECTION
Nripen K. Saha *In* NASA. Langley Research Center, Computational Methods for Crashworthiness Aug. 1993 p 125-139 (For primary document see N94-19465 04-39)
Avail: CASI HC A03/MF A03

Numerical simulation of vehicle crashworthiness and occupant protection are addressed. The vehicle crashworthiness design objectives are to design the vehicle structure for optimum impact energy absorption, and to design the restraint system (seatbelts, airbags, bolsters, etc.) for optimum occupant protection. The following approaches are taken; a major part of the impact energy is to be absorbed by the vehicle structure; the restraint components will provide protection against the remaining crash energy; certain vehicle components are designed to deform under specific types and speeds of impact in a desired mode for sound energy management; structural components such as front side rails, rear rails, door structure and pillars undergo large amounts of deformation; and with properly designed geometry and material these components assist in mitigating the effects of impact. DIRECTIONS FOR COMPUTATIONAL MECHANICS IN AUTOMOTIVE CRASHWORTHINESS
James A. Bennett and T. B. Khalil *In* NASA. Langley Research Center, Computational Methods for Crashworthiness Aug. 1993 p 141-154 (For primary document see N94-19465 04-39)
Avail: CASI HC A03/MF A03

The automotive industry has used computational methods for crashworthiness since the early 1970's. These methods have ranged from simple lumped parameter models to full finite element models. The emergence of the full finite element models in the mid 1980's has significantly altered the research direction. However, there remains a need for both simple, rapid modeling methods and complex detailed methods. Some directions for continuing research are discussed. Author (revised)

Avail: CASI HC A03/MF A03

The explicit transient dynamics technology in use today for simulating the impact and subsequent transient dynamic response of a structure has its origins in the 'hydrocodes' dating back to the late 1940's. The growth in capability in explicit transient dynamics technology parallels the growth in speed and size of digital computers. Computer software for simulating the explicit transient dynamic response of a structure is characterized by algorithms that use a large number of small steps. In explicit transient dynamics software there is a significant emphasis on speed and simplicity. The finite element technology used to generate the spatial discretization of a structure is based on a compromise between completeness of the representation for the physical processes modelled and speed in execution. That is, since it is expected in every calculation that the deformation will be finite and the material will be strained beyond the elastic range, the geometry and the associated gradient operators must be reconstructed, as well as complex stress-strain models evaluated at every time step. As a result, finite elements derived for explicit transient dynamics software use the simplest and barest constructions possible for computational efficiency while retaining an essential representation of the physical behavior. The best example of this technology is the four-node bending quadrilateral derived by Belytschko, Lin and Tsay. Today, the speed, memory capacity and availability of computer hardware allows a number of the previously used algorithms to be 'improved.' That is, it is possible with today's computing hardware to modify many of the standard algorithms to improve their representation of the physical process at the expense of added complexity and computational effort. The purpose is to review a number of these algorithms and identify the improvements possible. In many instances, both the older, faster version of the algorithm and the improved and somewhat slower version of the algorithm are found implemented together in software. Specifically, the following seven algorithmic items are examined: the invariant time derivatives of stress used in material models expressed in rate form; incremental objectivity and strain used in the numerical integration of the material models; the use of one-point element integration versus mean quadrature; shell elements used to represent the behavior of thin structural components; beam elements based on stress-resultant plasticity versus cross-section integration; the fidelity of elastic-plastic material models in their representation of ductile metals; and the use of Courant subcycling to reduce computational effort. A brief overview of the transient dynamics capabilities at Sandia National Laboratories, with an emphasis on recent new developments and current research is presented. In addition, the Sandia National Laboratories (SNL) Engineering Analysis Code Access System (SEACAS), which is a collection of structural and thermal codes and utilities used by analysts at SNL, is described. The SEACAS system includes pre- and post-processing codes, analysis codes, database translation codes, support libraries, Unix shell scripts for execution, and an installation system. SEACAS is used at SNL on a daily basis as a production, research, and development system for the engineering analysts and code developers. Over the past year, approximately 190 days of CPU time were used by SEACAS codes on jobs running from a few seconds up to two and one-half days of CPU time. SEACAS is running on several different systems at SNL including Cray Unicos, Hewlett Packard PH-UX, Digital Equipment Ultrix, and Sun SunOS. An overview of SEACAS, including a short description of the codes in the system, are presented. Abstracts and references for the codes are listed at the end of the report. Author (revised)

The authors used an axisymmetric, two-dimensional Eulerian computer simulation program to simulate the penetration of a tungsten rod, with length to diameter ratio $L/D = 10$, into a thick steel target and the same rod into finite steel plates of thicknesses between 0.9 and 1.3 L. They compare the perforation limit with the semi-infinite penetration depth at the same velocity (the excess thickness) when the model for target strength is constant yield stress and when the model incorporates work hardening and thermal softening. The authors also compare their computed results with available experimental results, which show an excess thickness of about 1 rod diameter. DOE

SHELL DESIGNS Final Report, Jun. 1991 - Jul. 1992
Ronald B. Crosier Aug. 1993 22 p
(AD-A270656; ERDEC-TR-104) Avail: CASI HC A03/MF A01

The shell designs consist of two series of related designs (the uniform shell designs and the simplicial shell designs) that are used for fitting second-order response surfaces over spherical regions. The shell designs for two, four, six, and eight factors require fewer experimental runs than the central composite designs or the Box-Behnken designs, but they have not been used much because of their unequal treatment of the design factors. Rotations of the shell designs that provide an equal treatment of the factors are given. The rotated uniform shell designs have seven levels of each factor with the exception of the three-factor design (three levels) and the eight-factor design (five levels). An orthogonal blocking scheme is given for the uniform shell designs with an even number of factors. The simplicial shell designs have nine levels, except for the two-factor and seven-factor designs, which have seven levels, and the three-factor design, which has five levels but is singular. The simplicial shell designs have an orthogonal blocking scheme for any number of factors. DTIC

A model for shear behavior of reinforced concrete beams is formulated and extended to spatial punching problem. The main theories of shear behavior and calculations based on the finite-element method are presented. A model, which takes into account crack bank dovetailing, was developed for depicting shear behavior of concrete slabs with an optimization of elastic potential. The model is shown to allow the maximal transverse force in failure state to be estimated and the failure cause of a beam to be determined. Principles of calculation of reinforced concrete plates and theories of punching behavior with concentrated single loads were summarized, considering ideally elastic or plastic materials. The model of a plane slab was extended to the calculation of beam on a spatial assembly of slabs and slices. ESA

FATIGUE CRACK INITIATION IN RIVETED LAP JOINTS AND IN PRESSURIZED FUSELAGES

Richard P. G. Mueller Jun. 1993 27 p Presented at the SAMPE European Conference, Birmingham, England, 19-21 Oct. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(LR-725; ETN-93-95029) Avail: CASI HC A03

Riveted joints in pressurized fuselages are exposed to severe fatigue loading. The study was carried out to increase fundamental understanding of the behavior of riveted fuselage joints. Areas of interest include rivet flexibility, load transfer, residual stress distribution, fatigue crack location, secondary bending and inter-sheet friction. These aspects depend on the squeezing force used to drive the rivet. Flat uniaxially loaded riveted lap joint specimens show longer fatigue lives than curved riveted panels loaded by internal pressure in a barrel test setup. Strain gauge measurements on a barrel test setup show more severe loading of the non-countersunk inner sheet compared to the countersunk outer sheet. Finite element calculations gave insight to the improved fatigue crack initiation performance for increased sqeezing force and to the crack initiation location. The early crack initiation at the edges of flat riveted lap joint panels is explained. ESA

RAPID GEOPHYSICAL SURVEYOR

L. G. Roybal, G. S. Carpenter, and N. E. Josten 1993 16 p Presented at the SAGEEP 1993: Symposium on the Application of Geophysics To Environmental and Engineering Problems, San Diego, CA, 18-21 Apr. 1993

(Contract DE-AC07-76ID-01570)

(DE93-016637; EGG-M-92598; CONF-9304109-5) Avail: CASI HC A03/MF A01

The Rapid Geophysical Surveyor (RGS) is a system designed to rapidly and economically collect closely-spaced geophysical data used for characterization of Department of Energy (DOE) waste sites. Geophysical surveys of waste sites are an important first step in the remediation and closure of these sites; especially older sites where historical records are inaccurate and survey benchmarks have changed due to refinements in coordinate controls and datum changes. Closely-spaced data are required to adequately differentiate pits, trenches, and soil vault rows whose edges may be only a few feet from each other. A prototype vehicle designed to collect magnetic field data was built at the Idaho National Engineering Laboratory (INEL) during the summer of 1992. The RGS was one of several projects funded by the Buried Waste Integrated Demonstration (BWID) program. This vehicle was demonstrated at the Subsurface Disposal Area (SDA) within the Radioactive Waste Management Complex (RWMC) on the INEL in Sep. of 1992. Magnetic data were collected over two areas in the SDA, with a total survey area of about 1.7 acres. Data were collected at a nominal density of 2 1/2 inches along survey lines spaced 1 foot apart. Over 350,000 data points were collected over a 6 day period corresponding to about 185 man-days using conventional ground survey techniques. This report documents the design and demonstration of the RGS concept including the presentation of magnetic data collected at the SDA. The surveys were able to show pit and trench boundaries and determine details of their spatial orientation never before achieved. DOE

CTD AND XBT DATA COLLECTED ON ERS-1 VALIDATION CRUISE RRS CHARLES DARWIN CRUISE 62A, ICELAND-FAEROES REGION

R. T. Tokmakian, A. I. Morrison, S. G. Alderson, and M. A. Srokosz 1992 83 p

(IOS-294-1992; ETN-93-94557) Avail: CASI HC A05/MF A01

The hydrographic data set from the RRS Charles Darwin Cruise 62A, 6-26 Sep. 1991, whose objective was to evaluate the data from the sensors onboard the ESA ERS-1 satellite against in situ measurements, is described. The data set was collected in the region from 60 to 64 deg north and from 3 to 7 deg west. The region is to the north of the Faeroes. Two Conductivity/ Temperature/ Depth (CTD) and XBT surveys were conducted along two ERS-1 ground tracks, an ascending track and a descending track, forming a triangular survey region. The bottom corner of the survey is the point at which the two satellite tracks cross. XBT drops were conducted between the CTD stations. The collection, calibration, and processing of the CTD and XBT data are reported. Temperature, conductivity, and pressure were measured for each CTD station. A total number of 27 profiles are presented. Profile plots and listings are included for each CTD station. Both CTD and XBT contour plots are shown for each leg of the two surveys. ESA

DIRECTIONAL REGIONS IN GEOGRAPHIC INFORMATION SYSTEMS (GIS)
Douglass R. Caldwell and Linda H. Graff 3 Aug. 1993 10 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A268536; TEC-R-196) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

While direction is fundamental to geography, the implementation of directional functions in Geographical Information Systems (GIS) is limited. The focus paper is the extension of direction-related concepts through the definition of directional regions, such as the area north of Washington DC. Directional regions are constructed from combinations of six elements: the feature, the reference, an orientation, a viewspan, a viewfield and a region of interest. This approach allows users to create new area features which can be incorporated in a GIS. These features are a valuable tool for geographical analysis, since they further constrain reasoning on a data set. DTIC

SUPER-RESOLUTION OF MULTI-PIXEL AND SUB-PIXEL IMAGES FOR THE SDI Final Report
8 Jun. 1993 160 p Also included with AD-M000266
(Contract N00014-90-C-0173)
(AD-A268537; Rept-93-2881-06) Avail: CASI HC A08/MF A02

The recent profound shift in the global balance of power in favor of the United States of America has had major repercussions on Strategic Defense Initiative (SDI) planning. In particular, the focus has shifted from the provision of protection for the United States against a massive raid, involving possibly thousands of reentry vehicles, to defense against a much more limited attack which could now, however, be launched from any part of the world. Additionally, the United States is seeking to protect its forces and allies overseas, and in the task of missile detection and tracking, allowance must now be made for trajectories which can begin and end in almost any inhabited area of the globe. Thus SDI demands on surveillance technology have been significantly expanded. Space-based imaging systems will play a vital role in the surveillance task. In this report a description is first given of a typical scenario. The potential imaging problems are then examined, the mathematical background is discussed, and the innovative algorithms which have been developed for correcting and enhancing the performance of the imaging sensor are described. THE NAVY TESSELLATED SPHEROID MAP PROJECTION SYSTEM: A COMPREHENSIVE DEFINITION Final Report
Maura C. Lohrenz, Michael E. Trenchard, Stephanie A. Myrick, Perry B. Wischow, and Lancelot M. Riedlinger 11 Aug. 1993 30 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A269989; NRL/FR/7441-92-9408) Avail: CASI HC A03

This report describes a map projection model, called the Tessellated Spheroid (TS), which provides a seamless, global framework in which to store scanned chart data and, potentially, other types of spatial data as well. The Compressed Aeronautical Chart (CAC) is being developed at the Naval Research Laboratory in direct support of tactical Navy and Marine Corps aircraft mission planning systems and digital moving map systems. Aircraft programs that currently utilize the CAC database include the AV-8B Harrier, F/A-18 Hornet, and V-22 Osprey. There has been recent interest in using the TS system to store datasets other than CAC: the newly formed A-X program (which replaced the A-12 program) is interested in storing the Defense Mapping Agency Digital Landmass System data in the TS model; and other programs have shown interest in storing scanned nautical charts and satellite imagery in the TS system and, possibly, compressing that data in the same manner in which the CAC data is compressed. Following a detailed description of the TS model, this report discusses certain issues that must be addressed before the TS model can be applied to databases other than the original CAC. The most pressing issue relates to geographic scale. The CAC database includes six scale-models of chart data: 1:50k (k = thousand), 1:100k, 1:250k, 1:500k, 1:1M (M = million), and 1:2M. All TS parameters are based on the 1:2M scale-model, and any additional scales that are to utilize TS must be an integral divisor of 2,000,000. In addition, the TS segment file naming convention currently stipulates a maximum of 9000 TS segment rows, but scales that are larger than approximately 1:50k have more than 9000 rows. DTIC

COLOR PALETTE CONSIDERATIONS FOR DIGITAL MAP DISPLAYS Final Report
Michael E. Trenchard, Maura C. Lohrenz, Stacen Tyskiewicz, and Henry Rosche, III 3 Aug. 1993 17 p
(AD-A269991; NRL/FR/7441-92-9415) Avail: CASI HC A03/MF A01

The Map Data Formatting Facility is creating a library of Compressed Aeronautical Chart (CAC) data on a compact disk (CD) media in support of mission planning systems and airborne digital moving-map systems for military aircraft. The CAC library is generated by transforming the Defense Mapping Agency's Equal Arc-Second Raster Chart (ARC) Digitized Raster Graphics data from the ARC projection system into the Navy-specified tessellated spheroid projection system. The data are then color and spatially compressed using a technique known as vector quantization. This report discusses the method by which a standard set of thirty 8-bit color palettes, which are used for the color-compression portion of CAC generation, are built. Briefly, color compression is achieved by reducing the amount of color information from 24 bits per pixel to 8 bits per pixel via a color look-up table. A CAC color palette, which contains 256 entries (including 16 that are reserved for vector graphic overlays), is used to define the color look-up table. In addition, the color palette is written onto the final CAC CD-ROM for decompression operations. Since a single color palette will be used to color compress ARC digitized raster graphics data for one-fifth of the world at a given scale, prudent color selection is vital. DTIC

PROCEEDINGS OF THE 11TH SPACE SURVEILLANCE WORKSHOP
R. W. Miller and R Sridharan 1 Apr. 1993 140 p Workshop held in Lexington, MA, 30 Mar. - 1 Apr. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F19628-90-C-0002)
(AD-A269477; STK-206-Vol-2; ESC-TR-93-249-Vol-2) Avail: CASI HC A07

The eleventh Annual Space Surveillance Workshop hosted by MIT Lincoln Laboratory was held 30-31 March and 1 April 1993. The purpose of the series of workshops is to provide a forum for the presentation and discussion of space surveillance issues. This Proceedings documents most of the presentations from this workshop. The papers contained were reproduced directly from copies supplied by their authors (with minor mechanical changes where necessary). It is hoped that this publication will enhance the utility of the workshop. DTIC

RESOLUTION IN RADAR MAPPING M.S. Thesis
Michael D. Anderson Mar. 1993 90 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A269730) Avail: CASI HC A05

Signal processing has led to great performance gains in radar mapping. The most critical feature of these systems is cell size, which determines resolution. Cell size is defined by range resolution and azimuth resolution. Range resolution is improved through pulse compression. Phase of frequency modulation of a waveform yields increased bandwidth and shorter effective pulse width without reducing total signal energy. Several families of codes are investigated emphasizing matched filter output and doppler tolerance. Azimuth resolution is improved through beam sharpening. Several beam sharpening techniques are illustrated with radar images provided by Hughes Aircraft. Range bin output plots demonstrate the effectiveness of these techniques. With these techniques, 'near-SAR' quality output can be obtained from real beam mapping radars allowing the real-time and all aspect capabilities of real beam systems to be more fully employed in tactical missions. PROTOCOL FOR COMPUTATION OF SURFACE BOUNDARY LAYER PARAMETERS USED TO DETERMINE SOIL MOISTURE FLUX FROM METEOROLOGICAL DATA COLLECTED AT LLNL, 1992-1993
F. Gouveia Mar. 1993 22 p
(Contract W-7405-eng-48)
(DE93-018906; UCRL-ID-113516) Avail: CASI HC A03/MF A01

Starting May 1992, meteorological data is continuously collected for Environmental Restoration Division (ERD) at the LLNL weather-tower site. Mounted on a 2-meter mast are sensors for air temperature, wind speed and direction, relative humidity, net radiation flux, and ground heat flux. The height of the sensors and the sensor accuracies are listed. These sensors are sampled every second, and 15-minute averages are saved by the data logger for retrieval. Average and standard deviation (sigma(sub theta)) of wind direction are computed by the Campbell logger using polar coordinates. This report describes the reduction of continuously monitored data from 15-minute averages to hourly averages. The bulk of this report is dedicated to describing the computation of parameters that characterize the surface boundary layer. The ultimate goal is to provide estimates of the amount of evaporation of water from the surface. DOE

GRAVITY AND THE GEOID IN THE NEPAL HIMALAYA Final Technical Report, 1 Jul. 1991 - 30 Jun. 1992
Roger Bilham 1992 35 p
(Grant NAGw-2704)
(NASA-CR-194166; NAS 1.26:194166) Avail: CASI HC A03/MF A01

Materials within the Himalaya are rising due to convergence between India and Asia. If the rate of erosion is comparable to the rate of uplift the mean surface elevation will remain constant. Any slight imbalance in these two processes will lead to growth or attrition of the Himalaya. The process of uplift of materials within the Himalaya coupled with surface erosion is similar to the advance of a glacier into a region of melting. If the melting rate exceeds the rate of downhill motion of the glacier then the terminus of the glacier will receed up-valley despite the downhill motion of the bulk of the glacier. Thus although buried rocks, minerals and surface control points in the Himalaya are undoubtably rising, the growth or collapse of the Himalaya depends on the erosion rate which is invisible to geodetic measurements. Erosion rates are currently estimated from suspended sediment loads in rivers in the Himalaya. These typically underestimate the real erosion rate since bed-load is not measured during times of heavy flood, and it is difficult to integrate widely varying suspended load measurements over many years. An alternative way to measure erosion rate is to measure the rate of change of gravity in a region of uplift. If a control point moves vertically it should be accompanied by a reduction in gravity as the point moves away from the Earth's center of mass. There is a difference in the change of gravity between uplift with and without erosion corresponding to the difference between the free-air gradient and the gradient in the acceleration due to gravity caused by a corresponding thickness of rock. Essentially gravity should change precisely in accord with a change in elevation of the point in a free-air gradient if erosion equals uplift rate. We were funded by NASA to undertake a measurement of absolute gravity simultaneously with measurements of GPS height within the Himalaya. Since both absolute gravity and time are known in an absolute sense to 1 part in 10(exp 10) it is possible to estimate gravity with a precision of 0.1 mu gal. Known systematic errors reduce the measurement to an absolute uncertainty of 6 mu gal. The free air gradient at the point of measurement is typically about 3 mu gals/cm. At Simikot where our experiment was conducted we determined a vertical gravity gradient of 4.4 mu gals/cm. Derived from text

A SURVEY OF CURRENT APPROACHES TO MODELLING OF HYDROLOGICAL TIME-SERIES WITH RESPECT TO CLIMATE VARIABILITY AND CHANGE
George S. Cavadias Nov. 1992 51 p
(WMO/TD-534; WCASP-23) Avail: CASI HC A04/MF A01; print copy available at WMO, Geneva, Switzerland

The purpose of this report is to continue the implementation of project A2 of the World Climate Programme entitled 'Analyzing Long Time Series of Hydrological Data with Respect to Climate Variability and Change'. WMO is responsible for the implementation of this project. During the earlier stages of the project, member countries were invited to submit long hydrological time series. These were then forwarded by WMO to the data base of GRDC in Koblenz. Concurrently, WMO published Report No. WMO/TD No. 224 (WCAP-3) which contains a number of tests useful for analyzing time series for the purpose of detecting changes in their structure as well as a computer program for their application. The time series submitted to GRDC were used by Dr. H. Mitosek to test the hypothesis of no change in their means and variances and the results of this study show that, for a substantial number of the series tested, the above hypothesis was rejected. The further development of project A2 must be in the direction of a quantification of the location, form and magnitude of the changes in the structure of these series and of linking these changes to causative factors related to changes of climatic conditions. The quantification of the impacts of climatic change on the hydrologic conditions of river basins can be achieved by the formulation and estimation of mathematical models of two main types: (1) univariate models of meteorological and hydrological time series and (2) multivariate models which, in addition to flows, take into account the inputs of the basin system coming from the atmosphere, e.g. temperature and precipitation. The purpose of this report is twofold: to present a survey of the current literature on univariate and multivariate models taking into account the effects of climatic change on the hydrology of basins and to formulate a number of questions and point out possible directions for further research into this important problem. FOOTPRINT SIZE OF A HELICOPTER-BORNE ELECTROMAGNETIC INDUCTION SOUNDING SYSTEM VERSUS ANTENNA ALTITUDE
Austin Kovacs, J. S. Holladay, and Clyde J. Bergeron, Jr. Jul. 1993 19 p
(Contract N68452-86-MP-6003)
(AD-A270468; CRREL-93-12) Avail: CASI HC A03/MF A01

Helicopter-towed electromagnetic induction sounding systems were recently used for the remote measurement of sea-ice thickness and shallow sea bathymetry. An inherent aspect of this sensing technology is the large area, the footprint, over which an individual sounding is made. An overview of previous footprint size assessments is given and new footprint size estimates determined from sea ice survey data and analytical calculations are presented. All footprint determinations were found to be in reasonable agreement. For a vertical coaxial coil antenna arrangement the apparent footprint diameter was found to be about 1.25 times the antenna height above the conductive surface, and for a horizontal coplanar coil configuration the ratio is about 3.75 times the antenna height. SUNRAYCE 1993: WORKING SAFELY WITH LEAD-ACID BATTERIES AND PHOTOVOLTAIC POWER SYSTEMS

M. P. DePhillips, P. D. Moskowitz, and V. M. Fthenakis 3 Nov. 1992 13 p
(Contract DE-AC02-76CH-00016)
(DE93-016553; BNL-48416) Avail: CASI HC A03/MF A01

The US Department of Energy (DOE) is sponsoring SUNRAYCE 93 to advance tile technology and use of photovoltaics and electric vehicles. Participants will use cars powered by photovoltaic modules and lead-acid storage batteries. This brochure, prepared for students and faculty participating in this race, outlines the health hazards presented by these electrical systems and gives guidance on strategies for their safe usage. At the outset, it should be noted that working with photovoltaic systems and batteries requires electric vehicle drivers and technicians to have 'hands-on' contact with the car on a daily basis. It is important that no one work near a photovoltaic energy system or battery, either in a vehicle or on the bench, unless they familiarize themselves with the components in use and know and observe safe work practices including the safety precautions described in the manuals provided by the various equipment vendors and this document. DEVELOPMENT OF LARGE-AREA MONOLITHICALLY INTEGRATED SILICON-FILM PHOTOVOLTAIC MODULES

J. A. Rand, J. E. Cotter, A. E. Ingram, T. R. Ruffins, K. P. Shreve, R. B. Hall, and A. M. Barnett Jun. 1993 22 p Prepared for Midwest Research Inst., Golden, CO
(Contract DE-AC02-83CH-10093)
(DE93-010037; NREL/TP-413-5581) Avail: CASI HC A03/MF A01

This report describes work to develop Silicon-Film (trademark) Product 3 into a low-cost, stable solar cell for large-scale terrestrial power applications. The Product 3 structure is a thin (less than 100 micron) polycrystalline layer of silicon on a durable, insulating, ceramic substrate. The insulating substrate allows the silicon layer to be isolated and metallized to form a monolithically interconnected array of solar cells. High efficiency is achievable with the use of light trapping and a passivated back surface. The long-term goal for the product is a 1200 sq cm, 18%-efficient, monolithic array. The short-term objectives are to improve material quality and to fabricate 100 sq cm monolithically interconnected solar cell arrays. Low minority-carrier diffusion length in the silicon film and series resistance in the interconnected device structure are presently limiting device performance. Material quality is continually improving through reduced impurity contamination. Metallization schemes, such as a solder-dipped interconnection process, have been developed that will allow low-cost production processing and minimize R(sub s) effects. Test data for a nine-cell device (16 sq cm) indicated a V(sub oc) of 3.72 V. These first-reported monolithically interconnected multicrystalline silicon-on-ceramic devices show low shunt conductance (less than 0.1 mA/sq cm) due to limited conduction through the ceramic and no process-related metallization shunts. SIMPLIFIED PROCESSING FOR 23 PERCENT-EFFICIENT SILICON CONCENTRATOR SOLAR CELLS

D. S. Ruby, P. A. Basore, M. E. Buck, J. M. Gee, W. K. Schubert, and H. L. Tardy 1992 6 p Presented at the 23rd Institute of Electrical and Electronics Engineers (IEEE) Photovoltaic Specialists Conference, Louisville, KY, 10-14 May 1993
(Contract DE-AC04-76DP-00789)
(DE93-015018; SAND-92-2808C; CONF-930540-4) Avail: CASI HC A02/MF A01

We have developed a three-photomask process that requires only a single furnace step above 800 C to fabricate silicon concentrator cells with efficiencies approaching 23% on float-zone (FZ) Si and, for the first time, an efficiency of 20% on solar-grade Czochralski (Cz) Si. Until now, high-efficiency silicon concentrator cells that have demonstrated conversion efficiencies greater than 22% have used FZ silicon and required multiple dopant diffusions and several high-temperature furnace steps. These complexities increase processing costs and preclude the use of lower cost Cz silicon, which is easily degraded by repeated high-temperature cycling. Our simplified processing schedule retains most of the benefit available from high-performance cell designs while holding down processing costs, and it makes the use of lower cost Cz Si a viable option. The incorporation of a better optimized antireflection coating and a lower recombination back-surface field are projected to increase this performance even further. DOE

PERFORMANCE MAPPING OF THE STM4-120 KINEMATIC STIRLING ENGINE USING A STATISTICAL DESIGN OF EXPERIMENTS METHOD

M. A. Powell and K. S. Rawlinson 1992 6 p Presented at the 28th Intersociety Energy Conversion Engineering Conference, Atlanta, GA, 8-13 Aug. 1993

(Contract DE-AC04-76DP-00789)
(DE93-015132; SAND-92-2869C; CONF-930804-6) Avail: CASI HC A02/MF A01

A kinetic Stirling cycle engine, the Stirling Thermal Motors (STM) STM4-120, was tested at the Sandia National Laboratories Engine Test Facility (ETF) from March 1989-August 1992. Sandia is interested in determining this engine's potential for solar-thermal-electric applications. The last round of testing was conducted from July-August 1992 using Sandia-designed gas-fired heat pipe evaporators as the heat input system to the engine. The STM4-120 was performance mapped over a range of sodium vapor temperatures, cooling water temperatures, and cycle pressures. The resulting shaft power output levels ranged from 5-9 kW. The engine demonstrated high conversion efficiency (24-31%) even though the power output level was less than 40% of the rated output of 25 kW. The engine had been previously derated from 25 kW to 10 kW shaft power due to mechanical limitations that were identified by STM during parallel testing at their facility in Ann Arbor, MI. A statistical method was used to design the experiment, to choose the experimental points, and to generate correlation equations describing the engine performance given the operating parameters. The testing was truncated due to a failure of the heat pipe system caused by entrainment of liquid sodium in the condenser section of the heat pipes. Enough data was gathered to generate the correlations and to demonstrate the experimental technique. The correlation is accurate in the experimental space and is simple enough for use in hand calculations and spreadsheet-based system models. Use of this method can simplify the construction of accurate performance and economic models of systems in which the engine is a component. The purpose of this paper is to present the method used to design the experiments and to analyze the performance data. DOE

REGENERATIVE FUEL CELLS FOR HIGH ALTITUDE LONG ENDURANCE SOLAR POWERED AIRCRAFT
F. Mitlitsky, N. J. Colella, B. Myers, and C. J. Anderson (AeroVironment, Inc., Monrovia, CA.) 2 Jun. 1993 8 p Presented at the 28th Intersociety Energy Conversion Engineering Conference, Atlanta, GA, 8-13 Aug. 1993
(Contract W-7405-eng-48)
(DE93-016991; UCRL-JC-113485; CONF-930804-12) Avail: CASI HC A02/MF A01

High Altitude Long Endurance (HALE) unmanned missions appear to be feasible using a lightweight, high efficiency, span-loaded, Solar Powered Aircraft (SPA) which includes a Regenerative Fuel Cell (RFC) system and novel tankage for energy storage. An existing flightworthy electric powered flying wing design was modified to incorporate present and near-term technologies in energy storage, power electronics, aerodynamics, and guidance and control in order to substantiate feasibility. The design philosophy was to work with vendors to identify affordable near-term technological opportunities that could be applied to existing designs in order to reduce weight, increase reliability, and maintain adequate efficiency of components for delivery within 18 months. The energy storage subsystem for a HALE SPA is a key driver for the entire vehicle because it can represent up to half of the vehicle weight and most missions of interest require the specific energy to be considerably higher than 200 W-hr/kg for many cycles. This stringent specific energy requirement precludes the use of rechargeable batteries or flywheels and suggests examination of various RFC designs. An RFC system using lightweight tankage, a single fuel cell (FC) stack, and a single electrolyzer (EC) stack separated by the length of a spar segment (up to 39 ft), has specific energy of approximately 300 W-hr/kg with 45% efficiency, which is adequate for HALE SPA requirements. However, this design has complexity and weight penalties associated with thermal management, electrical wiring, plumbing, and structural weight. A more elegant solution is to use unitized RFC stacks (reversible stacks that act as both FC's and EC's) because these systems have superior specific energy, scale to smaller systems more favorably, and have intrinsically simpler thermal management. THE VALUE OF WINDPOWER: AN INVESTIGATION USING A QUALIFIED PRODUCTION COST MODEL
M. R. Milligan and A. H. Miller Jul. 1993 10 p Presented at the Windpower 1993, San Francisco, CA, 12-16 Jul. 1993
(Contract DE-AC02-83CH-10093)
(DE93-010043; NREL/TP-441-5730; CONF-930726-2) Avail: CASI HC A02/MF A01

As part of the US Department of Energy's Wind Energy Program at the National Renewable Energy Laboratory, we are using the Environmental Defense Fund's Electric Utility Financial & Production Cost Model (Elfin) as a tool to determine the value of wind energy to specific utilities. The cases we have developed exercise a number of options in the way in which wind energy is treated: as a load modifier (negative load); as a quick-start supply-side resource with hourly varying output; and probabilistically, using time-varying Weibull distributions. By using two wind speed distributions, two different wind turbines, and two different utilities, we show what the wind turbine cost/kW might be that results in a positive value of wind energy for these utilities. DOE

FAROW: A TOOL FOR FATIGUE AND RELIABILITY OF WIND TURBINES
P. S. Veers, C. H. Lange (Stanford Univ., CA.), and S. R. Winterstein (Stanford Univ., CA.) 1993 9 p Presented at the Windpower 1993 Conference, San Francisco, CA, 12-16 Jul. 1993
(Contract DE-AC04-76DP-00789)
(DE93-017639; SAND-93-0424C; CONF-930726-3) Avail: CASI HC A02/MF A01

FAROW is a computer program that evaluates the fatigue and reliability of wind turbine components using structural reliability methods. A deterministic fatigue life formulation is based on functional forms of three basic parts of wind turbine fatigue calculation: (1) the loading environment, (2) the gross level of structural response given the load environment, and (3) the local failure criterion given both load environment and gross stress response. The calculated lifetime is compared with a user specific target lifetime to assess probabilities of premature failure. The parameters of the functional forms can be defined as either constants or random variables. The reliability analysis uses the deterministic lifetime calculation as the limit state function of a FORM/SORM (first and second order reliability methods) calculation based on techniques developed by Rackwitz. Besides probability of premature failure, FAROW calculates the mean lifetime, the relative importance of each of the random variables, and the sensitivity of the results to all of the input parameters, both constant inputs and the parameters that define the random variable inputs. The ability to check the probability of failure with Monte Carlo simulation is included as an option. DOE

DEVELOPMENT OF A SELECTIVE VOLUMETRIC RECEIVER FOR CENTRAL RECEIVER SYSTEMS: INVESTIGATION OF PARAMETERS AND EXERGETIC EVALUATION Ph.D. Thesis - Ruhr Univ. [ENTWICKLUNG EINES SELEKTIVEN VOLUMETRISCHEN RECEIVERS FUER SOLARTURMKRAFTWERKE: PARAMETER-UNTERSUCHUNGEN UND EXERGETISCHE BEWERTUNG]
Robert Pitz-Paal Jan. 1993 162 p In GERMAN Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DLR-FB-93-05; ETN-93-94875) Avail: CASI HC A08

A concept of a staggered selective volumetric receiver for central receiver systems is proposed. A physical model was developed which is able to calculate the temperature distribution within the receiver parallel to the flow direction. Solar and thermal radiation were taken into account as a function of the wavelength as well as for convective heat transfer and heat conduction in the absorber walls. A variation of geometrical parameters, physical properties and running conditions shows important trends of the thermal behavior of the receiver which was rated by an exergetic efficiency. It was ascertained that the calculations offer a high potential for the exergetic efficiency of this receiver type, if an appropriate selection of the cutoff wavelength describing the selective absorption is performed. A general idealized behavior of physical absorber properties as well as the combination of Si-SiC ceramic and fused silica as absorber material were investigated in detail. A comprehensive estimation of the accuraccy of the code and the chosen assumptions was performed. ESA

Throughout the past several years, states have been receiving settlement monies distributed from escrow accounts maintained by the Department of Energy and various courts. These monies are paid by oil companies for alleged violations of the petroleum pricing regulations of the 1970's. These funds, commonly referred to as Petroleum Violation Escrow (PVE) or Oil Overcharge funds, have been an important tool in supporting energy efficiency programs and technologies at the state level. The aim of this publication is to highlight some of the many interesting, replicable projects funded with PVE monies and to serve as a resource for successful, energy efficiency programs in planning, technology application, and education. By capturing a number of these innovative state-level programs, this document will expand the information network on renewable energy and energy efficiency and serve as a point of departure for others pursuing similar goals. Projects referenced throughout this publication reflect some of the program areas in which the Department of Energy takes an active interest and fall into the following categories: (1) alternative fuels; (2) industrial efficiency and waste minimization; (3) electric power production from renewable resources; (4) building efficiency; (5) integrated resource planning; and (6) energy education. FIRST ON-SUN TEST OF NaK POOL-BOILER SOLAR RECEIVER
J. B. Moreno, C. E. Andraka, T. A. Moss, P. G. Cordeiro, V. E. Dudley, and K. S. Rawlinson 1993 9 p Presented at the 28th International Energy Conservation Engineering Conference, Atlanta, GA, 8-13 Aug. 1993
(Contract DE-AC04-76DP-00789)
(DE93-015003; SAND-93-1207C; CONF-930804-5) Avail: CASI HC A02/MF A01

During 1989-1990, a refluxing liquid-metal pool-boiler solar receiver designed for dish/Stirling application at 75 kW(sub t) throughput was successfully demonstrated at Sandia National Laboratories. Significant features of this receiver included (1) boiling sodium as the heat transfer medium, and (2) electric-discharge-machined (EDM) cavities as artificial nucleation sites to stabilize boiling. Following this first demonstration, a second-generation pool-boiler receiver that brings the concept closer to commercialization has been designed, constructed, and successfully tested. For long life, the new receiver is built from Haynes Alloy 230. For increased safety factors against film boiling and flooding, the absorber area and vapor-flow passages have been enlarged. To eliminate the need for trace heating, sodium has been replaced by the sodium-potassium alloy NaK-78. To reduce manufacturing costs, the receiver has a powdered-metal coating instead of EDM cavities for stabilization of boiling. To control incipient-boiling superheats, especially during hot restarts, it contains a small amount of xenon. In this paper, we present the receiver design and report the results of on-sun tests using a nominal 75 kW(sub t) test-bed concentrator to characterize boiling stability, hot-restart behavior, and thermal efficiency at temperatures up to 750 C. We also report briefly on late results from an advanced-concepts pool-boiler receiver. DOE

PHOTOBIOTECHNOLOGY: APPLICATION OF PHOTOSYNTHESIS TO THE PRODUCTION OF RENEWABLE FUELS AND CHEMICALS
E. Greenbaum 1993 16 p Presented at the 2nd International Conference on Solar Energy Storage and Applied Photochemistry, Cairo, Egypt, 6-11 Jan. 1993
(Contract DE-AC05-84OR-21400)
(DE93-015522; CONF-930105-1) Avail: CASI HC A03/MF A01

Sustained hydrogen photoevolution from Chlamydomonas reinhardtii and C. moewusii was measured under an anoxic, CO2-containing atmosphere. It has been discovered that light intensity and temperature influence the partitioning of reductant between the hydrogen photoevolution pathway and the Calvin cycle. Under low incident light intensity (1-3 W m(sup -2)) or low temperature (approx. 0 C), the flow of photosynthetic reductant to the Calvin cycle was reduced, and reductant was partitioned to the hydrogen pathway as evidenced by sustained H2 photoevolution. Under saturating light (25 W m(sup -2)) and moderate temperature 20 plus/minus 5 C, the Calvin cycle became the absolute sink for reductant with the exception of a burst of H2 occurring at light on. A novel photobiophysical phenomenon was observed in isolated spinach chloroplasts that were metalized by precipitating colloidal platinum onto the surface of the thylakoid membranes. A two-point irradiation and detection system was constructed in which a continuous beam helium-neon laser (lambda = 632.8 nm) was used to irradiate the platinized chloroplasts at varying perpendicular distances from a single linear platinum electrode in pressure contact with the platinized chloroplasts. No external voltage bias was applied to the system. The key objective of the experiments reported in this report was to measure the relative photoconductivity of the chloroplast-metal composite matrix. DOE

ANALYSIS OF SUPERCONDUCTING MAGNETIC ENERGY STORAGE APPLICATIONS AT A PROPOSED WIND FARM SITE NEAR BROWNING, MONTANA
K. L. Gaustad and J. G. DeSteese Jul. 1993 8 p Presented at the Windpower 1992, Seattle, WA, 19-23 Oct. 1992
(Contract DE-AC06-76RL-01830)
(DE93-018793; PNL-SA-22609; CONF-921049-10) Avail: CASI HC A02/MF A01

A computer program was developed to analyze the viability of integrating superconducting magnetic energy storage (SMES) with proposed wind farm scenarios at a site near Browning, Montana. The program simulated an hour-by-hour account of the charge/discharge history of a SMES unit for a representative wind-speed year. Effects of power output, storage capacity, and power conditioning capability on SMES performance characteristics were analyzed on a seasonal, diurnal, and hourly basis. The SMES unit was assumed to be charged during periods when power output of the wind resource exceeded its average value. Energy was discharged from the SMES unit into the grid during periods of low wind speed to compensate for below-average output of the wind resource. The option of using SMES to provide power continuity for a wind farm supplemented by combustion turbines was also investigated. Levelizing the annual output of large wind energy systems operating in the Blackfeet area of Montana was found to require a storage capacity too large to be economically viable. However, it appears that intermediate-sized SMES economically levelize the wind energy output on a seasonal basis. DOE

PHOTOVOLTAIC CONCENTRATOR INITIATIVE: CONCENTRATOR CELL DEVELOPMENT
J. H. Wohlgemuth and S. Narayanan (Solarex Corp., Frederick, MD.) May 1993 37 p
(Contract DE-AC04-76DP-00789)
(DE93-018505; SAND-92-7007) Avail: CASI HC A03/MF A01

This project involves the development of a large-area, low-cost, high-efficiency concentrator solar cell for use in the Entech 22-sun linear-focus Fresnel lens concentrator system. The buried contact solar cell developed at the University of New South Wales was selected for this project. Both Entech and the University of New South Wales are subcontractors. This annual report presents the program efforts from November 1990 through December 1991, including the design of the cell, development of a baseline cell process, and presentation of the results of preliminary cell processing. Important results include a cell designed for operation in a real concentrator system and substitution of mechanical grooving for the previously utilized laser scribing. DOE

HIGH-EFFICIENCY SILICON CONCENTRATOR CELL COMMERCIALIZATION
R. A. Sinton and R. M. Swanson (SunPower, Inc., Sunnyvale, CA.) May 1993 59 p
(Contract DE-AC04-76DP-00789)
(DE93-018491; SAND-93-7055) Avail: CASI HC A04/MF A01

This report summarizes the first phase of a forty-one month program to develop a commercial, high-efficiency concentrator solar cell and facility for manufacturing it. The period covered is November 1, 1990 to December 31, 1991. This is a joint program between the Electric Power Research Institute (EPRI) and Sandia National Laboratories. During the first year of the program, SunPower accomplished the following major objectives: (1) a new solar cell fabrication facility, which is called the Cell Pilot Line (CPL), (2) a baseline concentrator cell process has been developed, and (3) a cell testing facility has been completed. Initial cell efficiencies are about 23% for the baseline process. The long-range goal is to improve this efficiency to 27%. DOE

REPORT TO CONGRESS: COMPREHENSIVE PROGRAM PLAN FOR ADVANCED TURBINE SYSTEMS
Jul. 1993 51 p
(DE93-016718; DOE/FE-0279) Avail: CASI HC A04/MF A01

Consistent with the Department of Energy (DOE) mission, the Advanced Turbine Systems (ATS) Program will develop more efficient gas turbine systems for both utility and industrial electric power generation (including cogeneration). The program will develop base-load power systems for commercial offering in the year 2000. Although the target fuel is natural gas, the ATS will be adaptable to coal and biomass firing. All ATS will exhibit these characteristics: Ultra-high efficiency utility systems: 60 percent (lower heating value basis); industrial systems--15 percent improvement over today's best gas turbine systems; Environmental superiority (reduced nitrogen oxides (NO(x)), carbon dioxide (CO2), carbon monoxide (CO), and unburned hydrocarbons (UHC)); and cost competitiveness (10 percent lower cost of electricity). This Program Plan was requested in the House, Senate, and Conference Reports on the FY 1993 Interior and Related Agencies Appropriations Act, Public Law 102--381, and is consistent with the Energy Policy Act of 1992, which (in Section 2112) identifies work for improving gas turbines. This plan outlines the 8-year ATS Program and discusses rationale and planning. Total Program costs are estimated to be $700 million, consisting of an approximate $450 million government share, and an approximate $250 million cost-share by industrial participants. DOE

N94-18478# Oak Ridge National Lab., TN.
WORKSHOP ON INNOVATION IN MATERIALS PROCESSING AND MANUFACTURE: EXPLORATORY CONCEPTS FOR ENERGY APPLICATIONS
L. L. Horton, comp. Jun. 1993 69 p Workshop held in Oak Ridge, TN, 11-12 Mar. 1993
(Contract DE-AC05-84OR-21400)
(DE93-017674; ORNL-6760) Avail: CASI HC A04/MF A01

The goal of the workshop was to bring together industrial, academic, and DOE Laboratory personnel to discuss and identify potential areas for which creative, innovative, and/or multidisciplinary solutions could result in major payoffs for the nation's energy economy, DOE, and industry. The topics emphasized in these discussions were: surfaces and interfacial processing technologies, biomolecular materials, powder/precursor technologies, magnetic materials, nanoscale materials, novel ceramics and composites, novel intermetallics and alloys, environmentally benign materials, and energy efficiency. The workshop had a 2-day format. On the first day, there was an introductory session that summarized future directions within DOE's basic and materials technology programs, and the national studies on manufacturing and materials science and engineering. The balance of the workshop was devoted to brainstorming sessions by seven working groups. During the first working group session, the entire group was divided to discuss topics on: challenges for hostile environments, novel materials in transportation technologies, novel nanoscale materials, and opportunities in biomolecular materials. For the second session, the entire group (except for the working group on biomolecular materials) was reconfigured into new working groups on: alternative pathways to energy efficiency, environmentally benign materials and processes, and waste treatment and reduction: a basic sciences approach. This report contains separate reports from each of the seven working groups. DOE

GALLIUM ARSENIDE-BASED TERNARY COMPOUNDS AND MULTI-BAND-GAP SOLAR CELL RESEARCH
S. Vernon Jul. 1993 168 p Prepared for Midwest Research Inst., Golden, CO
(Contract DE-AC02-83CH-10093)
(DE93-010049; NREL/TP-451-5354) Avail: CASI HC A08/MF A02

This report describes work to achieve a high-efficiency, low-cost solar cell. The basic approach to the problem is centered upon the heteroepitaxial growth of a III-V compound material onto a single-crystal silicon wafer. The growth technique employed throughout this work is metal-organic chemical vapor deposition. The silicon wafer may serve as a mechanical substrate and ohmic contact for a single-junction device, or it may contain a p-n junction of its own and form the bottom cell of a two-junction tandem solar cell structure. The III-V material for the single-junction case is GaAs, and for the two-junction case it is either GaAlAs or GaAsP, either material having the proper composition to yield a band gap of approximately 1.7 eV. Results achieved in this contract include (1) a 17.6%-efficient GaAs-on-Si solar cell; (2) an 18.5%-efficient GaAs-on-Si concentrator solar cell at 400 suns; (3) a 24.8%-efficient GaAs-on-GaAs solar cell; (4) a 28.7%-efficient GaAs-on-GaAs concentrator solar cell at 200 suns; (5) the measurement of the effects of dislocation density and emitter doping on GaAs cells; and (6) improvements in the growth process to achieve reproducible thin AlGaAs window layers with low recombination velocities and environmental stability. DOE

RESEARCH ON STABLE, HIGH-EFFICIENCY AMORPHOUS SILICON MULTIJUNCTION MODULES
S. Guha Jul. 1993 64 p Prepared for Midwest Research Inst., Golden, CO
(Contract DE-AC02-83CH-10093)
(DE93-010046; NREL/TP-411-5654) Avail: CASI HC A04/MF A01

This report describes the progress made during Phase 2 of the R&D program to obtain high-efficiency amorphous alloy multijunction PV (photovoltaic) modules. The highlight of the work includes: (1) demonstration of world-record small-area efficiency of 11.2% after one-sun light-soaking at 50 C for 600 h using a dual band gap, double-junction structure; and (2) demonstration of initial module efficiency of 10.6% over 0.09-m(exp 2) (1-ft(exp 2)) area using the same double-junction approach. In addition, fundamental studies on material properties and cell performance have shown an interesting correlation between microstructure in the material and cell efficiency both in the initial and light-degraded conditions. DOE

TESTING AND EVALUATION OF LARGE-AREA HELIOSTATS FOR SOLAR THERMAL APPLICATIONS
J. W. Strachan and R. M. Houser Feb. 1993 61 p
(Contract DE-AC04-76DP-00789)
(DE93-018509; SAND-92-1381) Avail: CASI HC A04/MF A01

Two heliostats representing the state-of-the-art in glass-metal designs for central receiver (and photovoltaic tracking) applications were tested and evaluated at the National Solar Thermal Test Facility in Albuquerque, New Mexico from 1986 to 1992. These heliostats have collection areas of 148 and 200 m(exp 2) and represent low-cost designs for heliostats that employ glass-metal mirrors. The evaluation encompassed the performance and operational characteristics of the heliostats, and examined heliostat beam quality, the effect of elevated winds on beam quality, heliostat drives and controls, mirror module reflectance and durability, and the overall operational and maintenance characteristics of the two heliostats. A comprehensive presentation of the results of these and other tests is presented. The results are prefaced by a review of the development (in the United States) of heliostat technology. DOE

POTASSIUM-RANKINE POWER CONVERSION SUBSYSTEM MODELING FOR NUCLEAR ELECTRIC PROPULSION
Gregory A. Johnson Sep. 1993 128 p
(Contract NAS3-25808; RTOP 593-72-00)
(NASA-CR-191134; NAS 1.26:191134) Avail: CASI HC A07/MF A02

A potassium-Rankine power conversion system model was developed under Contract No. NAS3-25808 for the NASA-LeRC. This model predicts potassium-Rankine performance for turbine inlet temperatures (TIT) from 1200 - 1600 K, TIT to condenser temperature ratios from 1.25-1.6, power levels from 100 to 10,000 kWe, and lifetimes from 2-10 years. The model is for a Rankine cycle with reheat for turbine stage moisture control. The model assumes heat is supplied from a lithium heat transport loop. The model does not include a heat source or a condenser/heat rejection system model. These must be supplied by the user. Author

MOLTEN CARBONATE FUEL CELL NETWORKS: PRINCIPLES, ANALYSIS, AND PERFORMANCE
J. G. Wimer and M. C. Williams Jan. 1993 44 p
(DE93-000281; DOE/METC-93-4112) Avail: CASI HC A03/MF A01

The chemical reactions in an internally reforming molten carbonate fuel cell (IRMCFC) are described and combined into the overall IRMCFC reaction. Thermodynamic and electrochemical principles are discussed, and structure and operation of fuel cell stacks are explained. In networking, multiple fuel cell stacks are arranged so that reactant streams are fed and recycled through stacks in series for higher reactant utilization and increased system efficiency. Advantages and performance of networked and conventional systems are compared, using ASPEN simulations. The concept of networking can be applied to any electrochemical membrane, such as that developed for hot gas cleanup in future power plants. DOE

POLYCRYSTALLINE THIN-FILM CADMIUM TELLURIDE SOLAR CELLS FABRICATED BY ELECTRODEPOSITION
J. U. Trefny, T. E. Furtak, N. Wada, D. L. Williamson, and D. Kim Aug. 1993 42 p
(Contract DE-AC02-83CH-10093)
(DE93-018201; NREL/TP-451-5652) Avail: CASI HC A03/MF A01

This report describes progress during the first year of a 3-year program at Colorado School of Mines, based upon earlier studies performed by Ametek Corporation, to develop specific layers of the Ametek n-i-p structure as well as additional studies of several transparent conducting oxides. Thin films of ZnO and ZnO:Al were deposited under various conditions. For the n-layer of the Ametek structure, a dip-coating method was developed for the deposition of CdS films. The authors also present data on the characterization of these films by X-ray diffraction, Raman spectroscopy, scanning tunneling microscopy, small-angle X-ray scattering, and other techniques. They made progress in the electrodeposition of the CdTe i-layer of the Ametek structure. They developed appropriate electrochemical baths and are beginning to understand the role of the many experimental parameters that must be controlled to obtain high-quality films of this material. They explored the possibility of using an electrochemical process for fabricating the ZnTe p-layer. Some preliminary success was achieved, and this step will be pursued in the next phase. Finally, they fabricated a number of 'dot' solar cells with the structure glass/SnO2/CdS/CdTe/Au. Several cells with efficiencies in the range of 5%-6% were obtained, and they are confident, given recent progress, that cells with efficiencies in excess of 10% will be achieved in the near future. DOE

(Contract DE-AC04-76DP-00789)
(DE93-018489; SAND-93-7049) Avail: CASI HC A03/MF A01

This report describes work conducted between December 1990 and May 1992 continuing research on silicon concentrator solar cells. The objectives of the work were to improve the performance of high-efficiency cells upon p-type substrates, to investigate the ultraviolet stability of such cells, to develop concentrator cells based on n-type substrates, and to transfer technology to appropriate commercial environments. Key results include the identification of contact resistance between boron-defused areas and rear aluminum as the source of anomalously large series resistance in both p- and n-type cells. A major achievement of the present project was the successful transfer of cell technology to both Applied Solar Energy Corporation and Solarex Corporation. DOE

DEFECT BEHAVIOR OF POLYCRYSTALLINE SOLAR CELL SILICON
D. K. Schroder (Arizona State Univ., Tempe.), S. H. Park (Arizona State Univ., Tempe.), I. G. Hwang (Arizona State Univ., Tempe.), J. B. Mohr (Arizona State Univ., Tempe.), and M. P. Hanly (Arizona State Univ., Tempe.) May 1993 83 p
(Contract DE-AC04-76DP-00789)
(DE93-018490; SAND-93-7051) Avail: CASI HC A05/MF A01

The major objective of this study, conducted from October 1988 to September 1991, was to gain an understanding of the behavior of impurities in polycrystalline silicon and the influence of these impurities on solar cell efficiency. The authors studied edge-defined film-fed growth (EFG) and cast poly-Si materials and solar cells. With EFG Si they concentrated on chromium-doped materials and cells to determine the role of Cr on solar cell performance. Cast poly-Si samples were not deliberately contaminated. Samples were characterized by cell efficiency, current-voltage, deep-level transient spectroscopy (DLTS), surface photovoltage (SPV), open-circuit voltage decay, secondary ion mass spectrometry, and Fourier transform infrared spectroscopy measurements. They find that Cr forms Cr-B pairs with boron at room temperature and these pairs dissociate into Cr(i)(sup +) and B(sup -) during anneals at 210 degrees C for 10 min. Following the anneal, Cr-B pairs reform at room temperature with a time constant of 230 h. Chromium forms CrSi2 precipitates in heavily contaminated regions and they find evidence of CrSi2 gettering, but a lack of chromium segregation or precipitation to grain boundaries and dislocations. Cr-B pairs have well defined DLTS peaks. However, DLTS spectra of other defects are not well defined, giving broad peaks indicative of defects with a range of energy levels in the band gap. In some high-stress, low-efficiency cast poly-Si they detect SiC precipitates, but not in low-stress, high-efficiency samples. SPV measurements result in nonlinear SPV curves in some materials that are likely due to varying optical absorption coefficients due to locally varying stress in the material. DOE

OPTIMIZING WIND TURBINE CONTROL SYSTEM PARAMETERS
Larry L. Schluter and William A. Vachon (Vachon, William A. and Associates, Inc., Manchester, MA.) 1993 8 p Presented at the Windpower 1993 Conference, San Francisco, CA, 12-16 Jul. 1993
(Contract DE-AC04-76DP-00789)
(DE93-018861; SAND-93-0391C; CONF-930726-5) Avail: CASI HC A02/MF A01

The impending expiration of the levelized period in the Interim Standard Offer Number 4 (ISO4) utility contracts for purchasing wind-generated power in California mandates, more than ever, that windplants be operated in a cost-effective manner. Operating plans and approaches are needed that maximize the net revenue from wind parks--after accounting for operation and maintenance costs. This paper describes a design tool that makes it possible to tailor a control system of a wind turbine (WT) to maximize energy production while minimizing the financial consequences of fatigue damage to key structural components. Plans for code enhancements to include expert systems and fuzzy logic are discussed, and typical results are presented in which the code is applied to study the controls of a generic Danish 15-m horizontal axis wind turbine (HAWT). DOE

N94-19040# Sandia National Labs., Albuquerque, NM.
BENCH-SCALE SCREENING TESTS FOR A BOILING SODIUM-POTASSIUM ALLOY SOLAR RECEIVER
J. B. Moreno and T. A. Moss Jun. 1993 71 p
(Contract DE-AC04-76DP-00789)
(DE93-018512; SAND-92-2253) Avail: CASI HC A04/MF A01

Bench-scale tests were carried out in support of the design of a second-generation 75-kW(sub t) reflux pool-boiler solar receiver. The receiver will be made from Haynes Alloy 230 and will contain the sodium-potassium alloy NaK-78. The bench-scale tests used quartz lamp heated boilers to screen candidate boiling stabilization materials and methods at temperatures up to 750 degree C. Candidates that provided stable boiling were tested for hot-restart behavior. Poor stability was obtained with single 1/4-inch diameter patches of powdered metal hot press sintered onto the wetted side of the heat-input area. Laser-drilled and electric discharge machined cavities in the heated surface also performed poorly. Small additions of xenon, and heated-surface tilt out of the vertical, dramatically improved poor boiling stability; additions of helium or oxygen did not. The most stable boiling was obtained when the entire heat-input area was covered by a powdered-metal coating. The effect of heated-area size was assessed for one coating: at low incident fluxes, when even this coating performed poorly, increasing the heated-area size markedly improved boiling stability. Good hot-restart behavior was not observed with any candidate, although results were significantly better with added xenon in a boiler shortened from 3 to 2 feet. In addition to the screening tests, flash-radiography imaging of metal-vapor bubbles during boiling was attempted. Contrary to the Cole-Rohsenow correlation, these bubble-size estimates did not vary with pressure; instead they were constant, consistent with the only other alkali metal measurements, but about 1/2 their size. DOE

ENERGY CONVERSION AND STORAGE PROGRAM Annual Report, 1992
E. J. Cairns Jun. 1993 24 p
(Contract DE-AC03-76SF-00098)
(DE93-018602; LBL-33444) Avail: CASI HC A03/MF A01

This report is the 1992 annual progress report for the Energy Conversion and Storage Program, a part of the Energy and Environment Division of the Lawrence Berkeley Laboratory. Work described falls into three broad areas: electrochemistry; chemical applications; and materials applications. The Energy Conversion and Storage Program applies principles of chemistry and materials science to solve problems in several areas: (1) production of new synthetic fuels, (2) development of high-performance rechargeable batteries and fuel cells, (3) development of advanced thermochemical processes for energy conversion, (4) characterization of complex chemical processes and chemical species, and (5) study and application of novel materials for energy conversion and transmission. Projects focus on transport-process principles, chemical kinetics, thermodynamics, separation processes, organic and physical chemistry, novel materials, and advanced methods of analysis. Electrochemistry research aims to develop advanced power systems for electric vehicle and stationary energy storage applications. Chemical applications research includes topics such as separations, catalysis, fuels, and chemical analyses. Included in this program area are projects to develop improved, energy-efficient methods for processing product and waste streams from synfuel plants, coal gasifiers, and biomass conversion processes. Materials applications research includes evaluation of the properties of advanced materials, as well as development of novel preparation techniques. For example, techniques such as sputtering, laser ablation, and poised laser deposition are being used to produce high-temperature superconducting films. DOE

THE CAESAR PROJECT: EXPERIMENTAL AND MODELING INVESTIGATIONS OF METHANE REFORMING IN A CATALYTICALLY ENHANCED SOLAR ABSORPTION RECEIVER ON A PARABOLIC DISH
J. F. Muir, R. E. Hogan, Jr., R. D. Skocypec, and R. Buck (Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Stuttgart, Germany.) Jul. 1993 136 p
(Contract DE-AC04-76DP-00789)
(DE93-040203; SAND-92-2131) Avail: CASI HC A07/MF A02

A joint US/Federal Republic of Germany (FRG) project has successfully tested a unique solar-driven chemical reactor in the Catalytically Enhanced Solar Absorption Receiver (CAESAR) experiment. The CAESAR test was a proof-of-concept demonstration of carbon-dioxide reforming of methane in a commercial-scale, solar, volumetric receiver/reactor on a parabolic dish concentrator. The CAESAR design, test facility and instrumentation, thermal and chemical tests, and analysis of test results are presented in detail. Numerical models for the absorber and the receiver are developed and predicted performance is compared with test data. Post test analyses to assess the structural condition of the absorber and the effectiveness of the rhodium catalyst are presented. Unresolved technical issues are identified and future development efforts are recommended. DOE

NATIONAL PROGRAM PLAN FUEL CELLS IN TRANSPORTATION
Feb. 1993 30 p
(Contract W-31-109-eng-38)
(DE93-017557; DOE/CH-93019) Avail: CASI HC A03/MF A01

Fuel cells are being developed for application in the transportation sector because they will convert hydrogen to electric power at high efficiencies with virtually no detrimental environmental impact. To realize these energy, environmental, and economic benefits, developers of FCV's need to (1) reduce the size and weight of current designs, (2) develop fuel cell propulsion systems with rapid start-up and greater load-following capability, (3) reduce system cost and/or improve performance, and (4) utilize alternative fuels to a large extent. This Plan addresses the FCV-related requirements of the Energy Act, describing a development program for light- and heavy-duty propulsion systems, a basic R&D program on fuel cell technology that is separate from, but feeds into, the system development activities, and supporting analyses. Implementation of the Program Plan by means of industry/government alliances will accelerate the commercialization of FCV's. In the long term, the successful deployment of large numbers of FCV's promises to eliminate the transportation sector as a major contributor to the nation's environmental problems. DOE

EXAMINATION OF CHARGE CARRIERS DYNAMICS IN SILICON AND SILICON SOLAR CELLS WITH PHOTOINDUCED LASER BEAM DEFLECTION Ph.D. Thesis [UNTERSUCHUNG DER LADUNGSTRAEGERDYNAMIK IN SILIZIUM UND SILIZIUMSOLARZELLEN MIT PHOTOINDUZIERTER LASERSTRAHLABLENKUNG]
Paul Grunow 1993 151 p In GERMAN Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ETN-93-95060) Avail: CASI HC A08

Photovoltaic solar cells are examined with photothermal deflection spectroscopy in a semiconductor. At solar cells with crystalline silicon basis, the concurrent recombination channels for recombination at the surface, in the space charge zone and in basis volume could be differentiated in closed and opened circuits from the laser signal course, as a function of polarization voltage and auxiliary exposure. The recombination in volume is described by minority carriers injection in solar cell basis volume and the recombination at the boundary surface is depicted with thermoionic emission of majority carriers above the barrier. Both currents show an exponential dependence on polarization voltage. The injection current in the space surface zone was obtained by solving the equation diffusion at the surface and both recombination currents were taken into account as boundary conditions for solving temperature distribution. The influence of the nonexposed side in charge carrier distribution was calculated and experimentally assessed with thickness dependent measurement at a silicon slice; it is found that heat flow from exposed surface in volume is limited by the nonexposed side so that the signal is saturated in the thermally dominated area of low modulation frequencies. AMORPHOUS SILICON BATCH PROCESS COST ANALYSIS
R. A. Whisnant and C. Sherring Aug. 1993 94 p Prepared in cooperation with Midwest Research Inst., Golden, CO
(Contract DE-AC02-83CH-10093)
(DE93-018203; NREL/TP-411-5644) Avail: CASI HC A05/MF A01

This report describes the development of baseline manufacturing cost data to assist photovoltaic manufacturing technology (PVMaT) monitoring teams in assessing current and future subcontracts, with an emphasis on commercialization and production. A process for the manufacture of a single-junction, large-area, a-Si module was modeled using an existing Research Triangle Institute (RTI) computer model. The model estimates a required, or break-even, price for the module based on its production process and the financial structure of the company operating the process. Sufficient detail on cost drivers is presented so the relationship of the process features and business characteristics can be related to the estimated required price. DOE

MONITORING THE RESPONSE OF THE UPPER TROPOSPHERE/LOWER STRATOSPHERE TO A GREENHOUSE GAS SCENARIO
J. M. Davis and S. K. Cox 15 Dec. 1992 22 p
(Contract DE-FG02-90ER-60970)
(DE93-014509; DOE/ER-60970/T1) Avail: CASI HC A03/MF A01

During the past two years a system has been under development to contribute to this monitoring process by making measurement of the downwelling infrared radiance field at moderate spectral resolution. Sensitivity of the measurements to the presence of cirrus cloudiness, and effective particle size in cirrus clouds has been demonstrated. Sensitivity of the measurements to concentration of CO2 and to the gross temperature structure of a 2CO2 atmosphere have been modeled, and measurements have been made at various locations to provide a data base for further system evaluation. A temperature retrieval algorithm has been acquired and examined concerning its potential for monitoring temperature and gaseous concentration profiles. A continued research program is described herein that may be divided into three parts. First, continued system development must be pursued. This includes continued attention to the absolute accuracy of the measurements, and implementation of the Path Characterization Algorithm (retrieval code). Second, the value of long term deployment of the system at a site of considerable elevation is necessary. Third, inclusion of a solar transmission capability at moderate resolution is proposed. DOE

VISIBILITY IMPAIRMENT ASSESSMENT: IMPORTANCE OF USING THEORETICALLY DERIVED OPTICAL CHARACTERIZATIONS
P. Middleton, D. Hopkins, E. Trexler, and N. Laulainen Jun. 1993 11 p Presented at the 86th Annual Meeting and Exhibition of the AWMA, Denver, CO, 13-18 Jun. 1993
(Contract DE-AC06-76RL-01830)
(DE93-017147; PNL-SA-21568; CONF-930647-5) Avail: CASI HC A03/MF A01

The 1990 federal amendments to the National Clean Air Act identified improvement of visibility as an important national goal. To help accomplish this goal, a national assessment of visibility impairment is being conducted for the US Department of Energy. The assessment examines the nature and extent of improvements in visual air quality that could result from major energy policy changes. Specifically, it is designed to assess the impact of SO2, NO(x), and VOC emission changes on visibility throughout the United States. A major objective of the ongoing work is to develop credible assessments that can be easily and meaningfully communicated to decision makers as well as to the scientific community. The overall assessment concept is outlined schematically. The visibility impairment assessment produces visibility patterns for a year at selected representative sites as a function of emissions and meteorological conditions. Annual cycles of visibility are generated from carefully selected observational and model data. The initial studies focus on individual sites and observation data. Later stages will employ more regional analyses with the help of more comprehensive modeling, tools. Results as well as a discussion of the implications for future characterizations at different locations through the US are discussed. DOE

The Kursk 1991 Experiment (KUREX-91) was conducted as one of a suite of international studies to develop capabilities to monitor global change. The studies were designed specifically to understand the earth's land-surface vegetation and atmospheric boundary layer interaction. An intensive field campaign was conducted at a site near Kursk, Russia during the month of July in 1991 by a team of international scientists to aid in the understanding of land-surface-atmosphere interactions in an agricultural/grassland setting. We were one of several teams of scientists participating at KUREX-91 at the Streletskaya Steppe Researve near Kursk, Russia. The main goals of our research were to: (1) characterize biophysical properties of the prairie vegetation; and (2) to characterize radiation regime through measurements and from estimates derived from canopy bidirectional reflectance data. Four objectives were defined to achieve these goals: (1) determine dependence of leaf optical properties on leaf water potential of some dominant species in discrete wavebands in the visible, near-infrared, and mid-infrared (spanning 0.4-2.3 microns range); (2) characterize the effective leaf area index (LAI) and leaf angle distribution of prairie vegetation; (3) characterize the radiation regime of the prairie vegetation through measures of the radiation balance components; and (4) examine, develop, and test methods for estimating albedo, APAR, and LAI from canopy bidirectional reflectance data. Papers which were the result of the research efforts are included. Author (revised)

AIR POLLUTION EFFECTS FIELD RESEARCH FACILITY. 3: UV-B EXPOSURE AND MONITORING SYSTEM
J. A. McEvers, M. S. Hileman, and N. T. Edwards Mar. 1993 119 p

(Contract DE-AC05-84OR-21400)
(DE93-013098; ORNL/TM-11607) Avail: CASI HC A06/MF A02

The Oak Ridge National Laboratory Outdoor UltraViolet-B (UV-B) Exposure and Monitoring Facility was developed in 1980 to provide well-controlled and -monitored exposure of specific terrestrial plant. species to elevated levels of ultraviolet (UV) radiation. The introduction of various anthropogenic agents into the earth's stratosphere has resulted in a decrease in the volume of ozone (O3) present here. The decrease in O3 has resulted in an increase in the level of UV radiation reaching thee earth's surface. Of particular interest is the level of UV-B, because it has the most detrimental effect on living tissue. A thorough understanding of the effects of elevated levels of UV-B on living tissue is critical to the formulation of economic policy regarding production of such agents and alternative strategies. The UV region of interest is referred to as UV-B and corresponds to radiation with a wavelength of 290 to 320 nm. Design, operation, and performance of the automated generation, exposure, and monitoring system are described. The system has proved to be reliable and easy to maintain and operate, and it provides significant flexibility in exposure programs. The system software is described, and detailed listings are provided. The ability to expose plants to controlled set point percentages of UV-B above the ambient level was developed. DOE

CARBON DIOXIDE INFORMATION ANALYSIS CENTER: FY 1992 ACTIVITIES

R. M. Cushman and F. W. Stoss Mar. 1993 87 p
(Contract DE-AC05-84OR-21400)
(DE93-013845; ORNL/CDIAC-58; ESDC-3984) Avail: CASI HC A05/MF A01

During the course of a fiscal year, Oak Ridge National Laboratory's Carbon Dioxide Information Analysis Center (CDIAC) distributes thousands of specialty publications-numeric data packages (NDPs), computer model packages (CMPs), technical reports, public communication publications, newsletters, article reprints, and reference books-in response to requests for information related to global environmental issues, primarily those pertaining to climate change. CDIACs staff also provides technical responses to specific inquiries related to carbon dioxide (CO2), other trace gases, and climate. Hundreds of referrals to other researchers, policy analysts, information specialists, or organizations are also facilitated by CDIAC's staff. This report provides an account of the activities accomplished by CDIAC during the period October 1, 1991 to September 30, 1992. An organizational overview of CDIAC and its staff is supplemented by a detailed description of inquiries received and CDIAC's response to those inquiries. As analysis and description of the preparation and distribution of numeric data packages, computer model packages, technical reports, newsletters, fact sheets, specialty publications, and reprints is provided. Comments and descriptions of CDIAC's information management systems, professional networking, and special bilateral agreements are also described. DOE

TITLE 1 IMPLEMENTATION: STATUS REPORT ON NONATTAINMENT AREAS

L. D. Kenkeremath and T. C. Snyder Jan. 1993 99 p
(Contract W-31-109-eng-38)
(DE93-017677; ANL/EAIS/TM-98) Avail: CASI HC A05/MF A02

Key provisions of Title 1 of the Clean Air Act Amendments of 1990 (CAAA) focus on bringing cities and other areas into attainment of the National Ambient Air Quality Standards for ozone, carbon monoxide (CO), and fine particulates (PM-10). The CAAA's new classification scheme for pollutant nonattainment areas is based on the relative severity of pollution in these areas and determines the stringency of control measures and the dates by which attainment of the standards will be required. The US Environmental Protection Agency's (EPA's) final rule on air quality designations and classifications, published in late 1991, shows that ozone pollution remains a persistent problem; the number of counties that fail to meet the ozone standard has sharply increased since 1987. In contrast, incidence of PM-10 pollution has decreased; many counties have achieved the PM-10 standard since 1987. Nationwide, the number of CO nonattainment areas has increased, though not dramatically. Many of the new Title 1 requirements focus on the role of nitrogen oxides (NO(x)) in the formation of ground-level ozone. In ozone nonattainment areas and ozone transport regions, Title 1 generally requires major sources of NO(x) to have the same control measures as those that apply to major sources of volatile organic compounds (VOCs). This requirement compels state regulators to adopt an integrated VOC/NO(x) control strategy. The NO(x) emission standards proposed by state regulators are considerably more stringent than those given in federal guidelines. Both the EPA and the states plan to allow the use of multifacility emissions averaging in state NO(x) control strategies, thereby, providing industry flexibility. Proposed federal Economic Incentive Program (EIP) rules would also allow sources in states with approved EIPs to use mobile source emission reduction credits to meet certain stationary source emission reduction requirements. ASSESSING IMPACTS OF CLIMATE CHANGE ON FORESTS: THE STATE OF BIOLOGICAL MODELING

V. H. Dale and H. M. Rauscher Apr. 1993 49 p Presented at the Workshop on Integrated Assessments of the Impacts of Climate Change on Natural Resources, San Diego, CA, 28 Feb. - 4 Mar. 1993
(Contract DE-AC05-84OR-21400)
(DE93-015916; CONF-9302127-1) Avail: CASI HC A03/MF A01

Models that address the impacts to forests of climate change are reviewed by four levels of biological organization: global, regional or landscape, community, and tree. The models are compared as to their ability to assess changes in greenhouse gas flux, land use, maps of forest type or species composition, forest resource productivity, forest health, biodiversity, and wildlife habitat. No one model can address all of these impacts, but landscape transition models and regional vegetation and land-use models consider the largest number of impacts. Developing landscape vegetation dynamics models of functional groups is suggested as a means to integrate the theory of both landscape ecology and individual tree responses to climate change. Risk assessment methodologies can be adapted to deal with the impacts of climate change at various spatial and temporal scales. Four areas of research development are identified: (1) linking socioeconomic and ecologic models, (2) interfacing forest models at different scales, (3) obtaining data on susceptibility of trees and forest to changes in climate and disturbance regimes, and (4) relating information from different scales. THE CARBON DIOXIDE EMISSIONS GAME: PLAYING THE NET

K. R. Richards, J. A. Edmonds, D. H. Rosenthal, and M. Wise Jun. 1993 14 p Presented at the Carbon Sinks Workshop for the Interagency National Action Plan Development Process, Washington, DC, 10-11 Jun. 1993
(Contract DE-AC06-76RL-01830)
(DE93-017670; PNL-SA-22658; CONF-9306214-1) Avail: CASI HC A03/MF A01

Concern about rising concentrations of carbon dioxide in the earth's atmosphere has led to calls for the United States and other countries to reduce carbon emissions. These concerns resulted in the signing of the Framework Convention on Climate Change at the United Nations Conference on the Environment and Development in Rio de Janeiro in June 1992. The Framework calls for nations to develop action plans for limiting emissions of carbon and other greenhouse gases. In December 1992, in accordance with the Framework, the US Government released for public comment its National Action Plan for Global Climate Change (US Department of State, 1992). The Action Plan detailed steps for reducing carbon emissions by 93 to 130 million metric tons (MMT) by 2000. Some of the steps included in the Action Plan were reforming regulations, setting energy standards, promoting research and development of new energy technologies, expanding the use of alternative-fueled vehicles, and planting trees to sequester carbon. This paper explores the economic implications of implementing a much larger tree-planting program than the one presented in the Action Plan. Whereas the Action Plan estimated that 5 to 9 MMT of carbon (MMTC) could be sequestered in 2000 (with perhaps threefold increases in sequestration in later years when trees are growing the fastest), the program being considered in this analysis annually sequesters as much as 231 MMTC during its peak years. Our analysis focuses on how much the costs of stabilizing US carbon emissions at 1990 levels are reduced when economic criteria alone determine the number of trees that will be used. Our results show that when the focus is shifted from stabilization of gross emissions to net emissions the cost reductions are dramatic, about 20 to 80 percent depending on the assumed cost of trees. Political and institutional obstacles to the formation of such a cost effective response are explored in the conclusions. DOE

COST EFFECTIVE ENERGY STRATEGIES FOR THE REDUCTION OF CO2 EMISSIONS IN THE UNITED STATES: COUNTRY REPORT FOR ETSAP ANNEX 4

S. C. Morris, J. L. W. Marcuse, and G. Goldstein Feb. 1993 36 p
(Contract DE-AC02-76CH-00016)
(DE93-016842; BNL-48961) Avail: CASI HC A03/MF A01

The energy system of the United States of America was analyzed using MARKAL. The time period of the study was 1990-2030. Projected energy demands over this period for a Reference Scenario were largely modeled after the US Energy Information Administration's 1992 Annual Energy Outlook for 1990-2010 and from the National Energy Strategy for the period 2010-2030. Expectations of maximum growth rates of conservation and renewable energy technologies were based on the same sources. Reductions in CO2 emissions were achieved by setting absolute constraints on total emissions levels by year and by carbon taxes. A 10% reduction in CO2 emissions was near the limit of technical feasibility for this scenario. This resulted in an overall cost increase of $1.1 trillion present value, but marginal costs on CO2 emissions reductions ranged up to $3300/ton. Over 70% of the CO2 emissions reduction occurred in electrical generation, partly resulting from decreases in demand for electricity. Additional scenarios were run for conditions of low economic growth and with the addition of carbon sequestering technologies. DOE

A BAYESIAN APPROACH TO CONTAMINANT PLUME DELINEATION

R. L. Johnson 1993 10 p Presented at the 1993 Groundwater Modeling Conference, Boulder, CO, 6-12 Jun. 1993
(Contract W-31-109-eng-38)
(DE93-012909; ANL/EAIS/CP-79173; CONF-9306158-2) Avail: CASI HC A02/MF A01

Fundamental to accurate modeling of groundwater contaminant transport is an understanding of the initial extent of contamination. The initial location of contamination must typically be inferred from relatively little 'hard' sampling data, and related 'soft' information. A combination of Bayesian analysis and spatial statistics is used to generate initial estimates of contamination based both on 'soft' information (i.e., prior modeling results, past experience, etc.) and 'hard' data (i.e., sampling results). A Beta distribution is used to represent the probability that contamination is present at any grid node. For every node, prior Beta probability density functions are revised into posterior distributions as additional data become available. The result is a node by node probabilistic representation of plume extent that can be updated as new information is generated, that indicates where additional sampling would have the greatest impact on the uncertainty associated with plume extent, and that can serve as the basis for Monte Carlo analysis of contaminant transport. This approach is demonstrated with information from a subsurface chromium plume beneath the chemical waste landfill at Sandia National Laboratory, Albuquerque, New Mexico. DOE

SETTING THE GLOBAL THERMOSTAT WITH AN EXHAUSTIBLE TRADEABLE PERMIT SYSTEM

R. G. Kosobud (Illinois Univ., Chicago.), K. G. Quinn (Illinois Univ., Chicago.), D. W. South, and T. A. Daly 1993 20 p Presented at the 4th International Conference on the Scientific and Policy Issues Facing All Governments, Chicago, IL, 5-8 Apr. 1993
(Contract W-31-109-eng-38)
(DE93-012911; ANL/EAIS/CP-79424; CONF-930415-1) Avail: CASI HC A03/MF A01

The global warming policy debate has centered largely on near-term objectives such as freezing 1990 CO2 emissions without regard to long-run implications. A policy of freezing CO2 emissions is shown to slow but not halt global warming, while requiring expensive near-term adjustments. If the long-run temperature change outcome of the freeze policy is set as the goal of a more graduated control policy, one which allows the market to determine annual emissions, a more cost-effective solution is obtained that reduces the negative adjustment effects on the energy and other affected industries. The most cost-effective emissions time path of a graduated control policy could be achieved by an evaporative marketable CO2 emissions permit system. This paper provides a preliminary examination of an evaporative permit system used to achieve long-run stabilization of greenhouse-induced temperature change. DOE

PRACTICAL REPORTING TIMES FOR ENVIRONMENTAL SAMPLES

C. K. Bayne, D. D. Schmoyer, and R. A. Jenkins Feb. 1993 50 p
(Contract DE-AC05-84OR-21400)
(DE93-013461; ORNL/TM-12316) Avail: CASI HC A03/MF A01

Pre-analytical holding times for environmental samples are specified because chemical and physical characteristics may change between sampling and chemical analysis. For example, the Federal Register prescribes a pre-analytical holding time of 14 days for volatile organic compounds in soil stored at 4 C. The American Society for Testing Materials (ASTM) uses a more technical definition that the pre-analytical holding time is the day when the analyte concentration for an environmental sample falls below the lower 99% confidence interval on the analyte concentration at day zero. This study reviews various holding time definitions and suggest a new pre-analytical holding time approach using acceptable error rates for measuring an environmental analyte. This practical reporting time (PRT) approach has been applied to nineteen volatile organic compounds and four explosives in three environmental soil samples. A PRT nomograph of error rates has been developed to estimate the consequences of missing a pre-analytical holding time. This nomograph can be applied to a large class of analytes with concentrations that decay linearly or exponentially with time regardless of sample matrices and storage conditions. DOE

CLOUD CCN FEEDBACK

J. G. Hudson 1992 4 p Presented at the 11th International Conference on Clouds and Precipitation, Montreal, Quebec, 17-21 Aug. 1992
(Contract DE-FG08-90ER-61012)
(DE93-016878; CONF-920881-4) Avail: CASI HC A01/MF A01

Cloud microphysics affects cloud albedo precipitation efficiency and the extent of cloud feedback in response to global warming. Compared to other cloud parameters, microphysics is unique in its large range of variability and the fact that much of the variability is anthropogenic. Probably the most important determinant of cloud microphysics is the spectra of cloud condensation nuclei (CCN) which display considerable variability and have a large anthropogenic component. When analyzed in combination three field observation projects display the interrelationship between CCN and cloud microphysics. CCN were measured with the Desert Research Institute (DRI) instantaneous CCN spectrometer. Cloud microphysical measurements were obtained with the National Center for Atmospheric Research Lockheed Electra. Since CCN and cloud microphysics each affect the other, a positive feedback mechanism can result. DOE

SHIP-PRODUCED CLOUD LINE OF 13 JULY 1991

E. E. Hindman, W. M. Porch, J. G. Hudson, and P. A. Durkee 1992 5 p Presented at the 11th International Conference on Clouds and Precipitation, Montreal, Quebec, 17-21 Aug. 1992
(Contract DE-FG08-90ER-61012)
(DE93-016879; CONF-920881-3) Avail: CASI HC A01/MF A01

Steaming ships can produce long linear cloud lines in regions of fog and broken stratus as well as in marine stratus layers. The lines are not always detected in 0.63 micron satellite images, but are often detected in the corresponding 3.7 microns images because the lines contain smaller and more numerous droplets than the stratus in which they are embedded as deduced by Coakley, et al. and measured by Radke, et al. They postulate cloud condensation nuclei (CCN) from steaming ships produced the more numerous and, hence, smaller cloud droplets. The ship-produced clouds are not always detected in 0.63 microns images because this wavelength is not as sensitive to changes in droplet size as is 3.7 microns. On 13 July 1991 a dramatic, ship-produced cloud line formed offshore of Baja California. Satellite images of the line and corresponding photographs from the R/V EGABRAG III which passed under the line are presented. The images and photos reveal the structure of the line. The EGABRAG was a source of CCN but did not produce a cloud line; they attempt to explain this important finding. DOE

STATISTICAL INTERCOMPARISON OF GLOBAL CLIMATE MODELS: A COMMON PRINCIPAL COMPONENT APPROACH WITH APPLICATION TO GCM DATA
S. K. Sengupta and J. S. Boyle May 1993 37 p
(Contract W-7405-eng-48)
(DE93-017951; UCRL-ID-114222) Avail: CASI HC A03/MF A01

Variables describing atmospheric circulation and other climate parameters derived from various GCM's and obtained from observations can be represented on a spatio-temporal grid (lattice) structure. The primary objective of this paper is to explore existing as well as some new statistical methods to analyze such data structures for the purpose of model diagnostics and intercomparison from a statistical perspective. Among the several statistical methods considered here, a new method based on common principal components appears most promising for the purpose of intercomparison of spatio-temporal data structures arising in the task of model/model and model/data intercomparison. A complete strategy for such an intercomparison is outlined. The strategy includes two steps. First, the commonality of spatial structures in two (or more) fields is captured in the common principal vectors. Second, the corresponding principal components obtained as time series are then compared on the basis of similarities in their temporal evolution. DOE

ENERGY EFFICIENCY AND THE ENVIRONMENT: INNOVATIVE WAYS TO IMPROVE AIR QUALITY IN THE LOS ANGELES BASIN
R. Ritschard Feb. 1993 46 p Presented at the 89th Annual Meeting of Association of American Geographers, Atlanta, GA, 6-10 Apr. 1993
(Contract DE-AC03-76SF-00098)
(DE93-016964; LBL-33725; CONF-9304172-1) Avail: CASI HC A03/MF A01

This paper focuses on novel, innovative approaches for reducing or delaying the production of photochemical smog in the Los Angeles Basin. These approaches include modifying the surface characteristics of the basin by increasing surface albedo and an extensive tree-planting program. The changes in surface conditions are designed to reduce the basin air temperatures, especially during the summer months, which will result in two possible effects. First, a decrease in temperature would lead to a reduction in energy use with an associated decline in emissions of nitrogen oxides (NO(x)) and a lowering of evaporative emission of reactive organic gases. Reductions in these smog precursors could improve the air quality of the basin without imposing additional emissions regulations. The second effect is associated with the possible causal relationship between air temperature and smog formation (i.e., lower temperatures and lower incidence of smog). Since this approach to mitigating air emissions is broad, the studies to date have concentrated on how changes in surface characteristics affect the meteorological conditions of the basin and on how these meteorological changes subsequently affect smog production. A geographic information system database of key surface characteristics (i.e., vegetative cover, albedo, moisture availability, and roughness) was compiled, and these characteristics were evaluated using prognostic meteorological models. The results of two- and three-dimensional meteorological simulations will be presented and discussed in this paper. DOE

REMOVING CFC'S FROM THE ATMOSPHERE WITH LASERS: A SECOND LOOK
T. H. Stix Jul. 1993 36 p Presented at the 20th IEEE International Conference on Plasma Sciences, Vancouver, British Columbia, 7-9 Jun. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-AC02-76CH-03073)
(DE93-017516; PPL-2923; CONF-930652-1) Avail: CASI HC A03

An option to both mitigate greenhouse warming and to help preserve the ozone layer could be to remove chlorofluorocarbons (CFC's) from their principal reservoir, the troposphere. But due to the extremely low atmospheric concentration of the CFC's (less than one part per billion by volume), such a process must be enormously selective to be cost-effective. It was suggested in 1989 that vast arrays of extremely powerful infrared lasers might be used to break up tropospheric CFC's via multiphoton dissociation (MPD). Computer calculations making use of an extensive atmospheric-gas infrared cross-section database suggest that -- at carefully chosen wavelengths -- 90% transmission over 50-kilometer paths would be possible through dry atmospheres. Still, a factor of 10 or 20 greater efficiency for the laser-CFC dissociation process is needed to bring the projected costs down to where the plan would merit serious consideration. The likeliest possibility for improvement appears to be to 'chirp' the infrared laser frequency, that is, lowering its frequency during each pulse so as to remain in resonance -- as long as possible -- with the anharmonic vibrations of the CFC molecules. What is needed is a factor of 10 or more decrease below the laser-beam fluence now thought to be required for CFC infrared multiphoton dissociation. Specifically, one would look to achieve CFC NTD with an infrared fluence of 0.1 to 0.2 joules per cm(sup 2). This goal may not be reachable, but laboratory experiments using presently available apparatus and techniques could explore this intriguing question. Following a summary of present knowledge concerning ozone depletion, this paper discusses the process of multiphoton dissociation and ways, including laser chirping, by which the MPD efficiency might be enhanced. DOE

CONDENSED GASES UNDER WINTER CONDITIONS: A STUDY FOR THE RESCUE SERVICES [KONDENSERADE GASER UNDER VINTERFOERHAELLANDEN: EN FOERSTUDIE FOER RAEDDNINGSTJAENSTEN]
Stellan Winter and Per Olof Granbom Dec. 1992 47 p In SWEDISH
Sponsored by National Rescue Services Board, Sweden
(FOA-C-40305-4.5; ETN-93-94491) Avail: CASI HC A03/MF A01

The behavior of spills of condensed gases under Winter conditions was studied using literature data. It was found that the liquids easily penetrate a snow layer and spread along the bottom of the snow cover. On flat ice the liquids may spread until the liquid film is only 0.5 mm thick. The study indicates that snow might give rise to considerable and fast evaporation of liquids having a low boiling point. Experiments are proposed to investigate the fraction of evaporation of chlorine, ammonia and sulphur dioxide when they are spilled onto snow at various topographic conditions. Experiments are also suggested to study how vapors of propane or butane burn in snow. For ammonia, ethylene oxide and sulphuric acid special experiments are recommended to find out how water solubility affects evaporation, pool spreading and state of aggregation. ESA

METADATA COMPILED AND DISTRIBUTED BY THE CARBON DIOXIDE INFORMATION ANALYSIS CENTER FOR GLOBAL CLIMATE CHANGE AND GREENHOUSE GAS-RELATED DATA BASES
T. A. Boden 1992 8 p Presented at the Scientific Data Management Workshop 1992, Salt Lake City, UT, 3-5 Nov. 1992
(Contract DE-AC05-84OR-21400)
(DE93-015338; CONF-9211115-3) Avail: CASI HC A02/MF A01

The Carbon Dioxide Information Analysis Center (CDIAC) compiles and provides information to help international researchers, policymakers, and educators evaluate complex environmental issues associated with elevated levels of atmospheric carbon dioxide (CO2) and other trace gases, including potential climate change. CDIAC is located within the Environmental Sciences Division of Oak Ridge National Laboratory (ORNL) in Oak Ridge, Tennessee and is line funded by the U.S. Department of Energy's (DOE) Global Change Research Program (GCRP). CDIAC is an information analysis center (IAC). In operation since 1982, CDIAC identifies sources of primary data at national and international levels; obtains, archives, evaluates, and distributes data and computer models; fully documents select data sets and computer models and offers them as numeric data packages (NDP's) and computer model packages (CMP's); distributes data and computer models on a variety of magnetic and electronic medias including 9-track magnetic tapes, IBM-formatted floppy diskettes, CD-ROM, and over Internet, Omnet, and Bitnet electronic networks; develops derived, often multidisciplinary data products useful for carbon cycle and climate-change research; distributes reports pertinent to greenhouse effect and climate change issues; produces the newsletter, CDIAC Communications; and in general acts as the information focus for the GCRP's research projects. Since its inception, CDIAC has responded to thousands of requests for information, and since 1985 has distributed more than 70,000 reports, NDP's and CMP's to 97 countries worldwide. DOE

THE LAND COMPONENT OF THE GLOBAL CLIMATE SYSTEM WITH ADEQUATE SPATIAL RESOLUTION
R. E. Dickinson 1 Mar. 1993 4 p
(Contract DE-FG02-91ER-61216)
(DE93-018951; DOE/ER-61216/2) Avail: CASI HC A01/MF A01

The overall import of this project was to support and focus collaboration between the University of Arizona and NCAR (and when appropriate DOE staff) towards achieving a state of the art land surface model available for CHAAMP and more general community use along with NCAR's CCM2 climate model. The goals of this program over a three year period are: to upgrade the BATS1e code to current programming standards as implemented in CCM2; and to document and design the next generation of this code; to reprogram BATS1e to carry out its integration over land in efficient vector loops and interface this code to CCM2; to formulate and implement CCM2 schemes to provide statistically prescribed distributions of precipitation, radiation and sub-scale cloudiness; and to perform sensitivity studies with the BATS1e scheme implemented in CCM2; and to develop graphical visualization procedures for scientific evaluation of the fine mesh output. Progress to date includes the following: the BATS code is being implemented in CCM2; statistics at the T-42 model resolution were developed; monthly average patterns of gauge precipitation, along with intensities and frequency of occurrence were mapped; PC hardware and software support was increased, and a geographic information system was used to support fine mesh data visualization. ON-LINE MONITORING OF INCINERATOR EMISSIONS
Zhuo-Xiong Mao, J. C. Demirgian, and E. Hwang 1993 22 p Presented at the 12th Annual International Symposium on Thermal Treatment Technologies - Incineration Conference, Knoxville, TN, 3-7 May 1993
(Contract W-31-109-eng-38)
(DE93-017406; ANL/CMT-ACL/CP-77718; CONF-930572-8) Avail: CASI HC A03/MF A01

As part of efforts to develop an on-line emissions monitor to detect specific organic compounds for incinerators, the authors tested a Fourier transform infrared spectrometer (FTIR) coupled with a long-path cell (LPC). A mixture of toluene, chlorobenzene, 1,1,1-trichloroethane, and trichloroethylene with elemental ratio C:H:Cl = 3:3.1:0.9 was incinerated in a methane/air flame. The effluent was continuously passed through a heated long-path cell. Eleven target compounds were simultaneously analyzed: methane, toluene, chlorobenzene, 1,1,1-trichloroethane, trichloroethylene, benzene, ethylene, hydrogen chloride, carbon monoxide, carbon dioxide, and water. During the testing, the incinerator temperature and the excess air ratio were deliberately changed to simulate both complete and incomplete combustion conditions in the incinerator. Test results indicate that the FTIR/LPC system can successfully follow concentration changes in the emissions that are associated with the change in the incinerator operations. In addition to carbon monoxide, methane, ethylene, and benzene have been found to be major products of incomplete combustion of the mixture. In this paper, the authors also discuss problems related to obtaining representative calibration standards and to developing adequate methods for continuous monitoring of emissions. DOE

A COMPARISON OF WET AND DRY SCRUBBING SYSTEMS FOR CONTROL OF METALS AND DIOXIN/FURAN EMISSIONS FROM INCINERATORS
P. S. Farber and H. S. Huang 1993 13 p Presented at the Spring National Meeting of the American Inst. of Chemical Engineers, Houston, TX, 28 Mar. - 1 Apr. 1993
(Contract W-31-109-eng-38)
(DE93-017446; ANL/ES/CP-80079; CONF-930364-6) Avail: CASI HC A03/MF A01

In Europe and the United States, both wet and dry (including semidry) scrubbing systems are being used for control of emissions from all types of waste incinerators. In terms of the effectiveness of controlling particulates and acid gases, both types of scrubbing systems are capable of meeting US Environmental Protection Agency and European Community limits. Two of the more difficult emissions requirements for an incinerator air-pollution-control system to meet are the metals and the dioxin/furan limits. The dioxin/furan emissions requirement is especially stringent, calling for levels below 1 ng (10(exp -9)) per cubic meter toxic equivalency. The differences between wet and dry scrubbing systems are discussed in this paper, as well as the advantages and disadvantages of each in its application to the control of emissions from incinerators. Particular attention will be paid to control of metals and dioxin/furan emissions and to the sampling and analysis techniques used to measure these emissions. Toxic equivalency factors are explained, and in particular, the international toxic equivalency factor proposed as the US and European standard is discussed. This paper will also address some of the techniques being employed to minimize the emissions of toxic compounds and discuss the use of combined wet and dry scrubbing systems for increased assurance of compliance. DOE

THE URBAN PERSPECTIVES OF ACID RAIN
B. E. Tonn Jun. 1993 123 p Presented at the Urban Perspective of Acid Rain, Raleigh, NC, 23-24 Sep. 1992
(Contract DE-AC05-84OR-21400)
(DE93-018881; ORNL/M-2936-Summ; CONF-9209381-Summ) Avail: CASI HC A06/MF A02

This report documents discussions held during a workshop an Urban Perspective of Acid Rain. The workshop was sponsored by the Office of the Director, National Acid Precipitation Assessment Program (NAPAP). NAPAP anticipates giving increased emphasis to the benefits in urban areas of emissions reductions. The goal of this informal, exploratory workshop was to serve as a first step towards identifying pollutant monitoring, and research and assessment needs to help answer, from an urban perspective, the two key questions posed to NAPAP by Congress: (1) what are the costs, benefits, and effectiveness of the acid rain control program, and (2) what reductions in deposition, rates are needed in order to prevent adverse effects? The workshop addressed research activities needed to respond to these questions. The discussions focused, sequentially, on data needs, data and model availability, and data and modeling gaps. The discussions concentrated on four areas of effects: human health, materials, urban forests, and visibility. DOE

A REVIEW AND EVALUATION OF THE ADAM 2.1 DISPERSION MODEL Final Report, Oct. 1991 - Sep. 1992
Bruce A. Kunkel 1 Oct. 1992 68 p
(AD-A269896; AD-E201605; PL-TR-92-2245; ERP-1109) Avail: CASI HC A04/MF A01

ADAM 2.1 is a heavy gas, gaussian puff dispersion model which predicts the hazard area resulting from the release of a toxic chemical. The model takes into account: (1) the chemical reaction, if any, that takes place when the chemical is released to the atmosphere; (2) the gravitational slumping due to the high density of the cloud (due to aerosol presence, temperature or molecular weight); and, (3) the dispersion due to atmospheric turbulence. Sixteen different source types are modeled including instantaneous and continuous releases, pressurized liquid and gas releases, and non-pressurized liquid releases, cryogenic and non-cryogenic liquid releases, and diked and undiked releases. The chemical data base contains data on eight chemicals -- ammonia, chlorine, fluorine, hydrogen fluoride, hydrogen sulfide, nitrogen tetroxide, phosgene, and sulfur dioxide. This report gives a general review of the model structure and its performance capabilities. A more detailed discussion of the model physics can be obtained from two earlier contractor reports. Model results are compared with the AFTOX dispersion model results and with field data. DTIC

INTERNATIONAL SYMPOSIUM ON THE ECOLOGICAL EFFECTS OF ARCTIC AIRBORNE CONTAMINANTS Abstracts Only
S. J. Christie, J. M. Martin, and J. E. Mello 8 Oct. 1993 152 p
Symposium held in Reykjavik, Iceland, 4-8 Oct. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A269955; CRREL-SR-93-23) Avail: CASI HC A08

This volume contains abstracts submitted to the symposium and accepted prior to July 1, 1993. The Steering Committee has decided to publish all accepted abstracts in a gesture to improve communications and awareness among all arctic researchers. This book is organized by session. Each session's abstracts are presented alphabetically by first author. The index in the back lists all authors and identifies the pages on which each author's abstracts are printed. Sessions cover the following topics: pathways of contaminants to the arctic biosphere, distribution of contaminants in the arctic biosphere, human health issues, arctic ecosystem responses to atmospheric contaminants, contaminant relationship to climate change, and information gaps and research needs. EFFECTS OF THE MOUNT PINATUBO ERUPTION ON SOLAR INSOLATION: FOUR CASE STUDIES
A. L. Rosenthal and J. M. Robert (New Mexico State Univ., Las Cruces.) May 1993 60 p
(Contract DE-AC04-76DP-00789)
(DE93-018454; SAND-93-7031) Avail: CASI HC A04/MF A01

The Southwest Technology Development Institute staff analyzed solar insolation data from four sites recorded during the years 1990 through 1992. Analyses were performed to identify and quantify the effects on insolation caused by the eruption of Mount Pinatubo in the Philippines on 15-16 June 1991. The four monitoring stations that supplied the raw data for this report were: The Southwest Region Experiment Station in Las Cruces, New Mexico; The Solar Radiation Research Laboratory at the National Renewable Energy Laboratory in Golden, Colorado; The Solar Insolation Monitor Program Station operated by the Pacific Gas and Electric Company in Carrisa Plains, California; and The Solar Insolation Monitor Station at Sandia National Laboratories in Albuquerque, New Mexico. Data from each of the sites were recorded by dedicated datalogging equipment. Every effort was made to prevent data acquisition system problems (e.g., drift of the datalogger clock) from influencing the accuracy of the results. DOE

CDIAC CATALOG OF NUMERIC DATA AND COMPUTER MODEL PACKAGES
T. A. Boden, F. M. OHara, Jr., and F. W. Stoss May 1993 84 p
(Contract DE-AC05-84OR-21400)
(DE93-017675; ORNL/CDIAC-62) Avail: CASI HC A05/MF A01

The Carbon Dioxide Information Analysis Center acquires, quality-assures, and distributes to the scientific community numeric data packages (NDP's) and computer model packages (CMP's) dealing with topics related to atmospheric trace-gas concentrations and global climate change. These packages include data on historic and present atmospheric CO2 and CH4 concentrations, historic and present oceanic CO2 concentrations, historic weather and climate around the world, sea-level rise, storm occurrences, volcanic dust in the atmosphere, sources of atmospheric CO2, plants' response to elevated CO2 levels, sunspot occurrences, and many other indicators of, contributors to, or components of climate change. This catalog describes the packages presently offered by CDIAC, reviews the processes used by CDIAC to assure the quality of the data contained in these packages, notes the media on which each package is available, describes the documentation that accompanies each package, and provides ordering information. Numeric data are available in the printed NDP's and CMP's, in CD-ROM format, and from an anonymous FTP area via Internet. All CDIAC information products are available at no cost. DOE

ENVIRONMENTAL RESTORATION AND WASTE MANAGEMENT FIVE-YEAR PLAN, FISCAL YEARS 1994-1998. VOLUME 3: PUBLIC CONCERNS
Aug. 1993 125 p
(DOE/S-00097P-Vol-3) Avail: CASI HC A06/MF A02

This document is the third and final volume of the Department of Energy (DOE) Environmental Restoration and Waste Management Five-Year Plan for Fiscal Years (FY) 1994-1998. The Five-Year Plan is the primary planning document for DOE environmental restoration and waste management activities. This document reflects increased stakeholder involvement and the continuing dialogue between DOE and those who are interested in, and affected by, the activities of the Office of Environmental Restoration and Waste Management (EM). It is designed to respond to public concerns regarding Volumes 1 and 2 of the the preliminary Five-Year Plan. The document is divided into the following sections: plan organization and structure; public participation and education; funding and budget issues; planning and management issues; regulatory compliance; waste management; environmental restoration; technology development; transportation; facility transition and management; and site-specific issues. Author (revised)

ECOLOGICAL AND ENVIRONMENTAL IMPACTS OF CONSTRUCTION IN THE COASTAL ZONE Report, 1987 - 1991
E. O. Gangstad 15 Sep. 1992 11 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A269196; OCE/NRM/93-3) Avail: CASI HC A03

Engineering works have been developed to alter the coastline to suit man's desires. However, imperfect knowledge of the nature of the forces acting in the coastal zone and their effects has resulted in unexpected or undesirable effects. Frequently such alterations create substantial conflicts between uses. For instance, use of the waters for waste disposal, resulting in pollution, directly conflicts with recreational and fishing uses. The filling of wetlands for use in residential, industrial, or port construction conflicts with wildlife and estuarine preservation, recreational uses, and fishing interests. DTIC

(AD-A269213; OCE/NRM/93-2) Avail: CASI HC A02

The U.S. Corps of Army Engineers has been charged by the Congress of the United States with the responsibility for construction and maintenance of shipping channels throughout the country. During the past 200 years it has created over 25,000 miles of channels and has developed over 100 commercial ports and harbors as well as over 4,000 small boat harbors. Each year the Corps of Engineers removes over 350 million cubic yards of dredged materials from the navigation channels. One particularly fruitful area of research is the Corps' attempt to create new marshes with dredged material. DTIC

LAND-USE RELATED SOURCES OF CO2, CH4 AND N2O: CURRENT GLOBAL EMISSIONS AND PROJECTIONS FOR THE PERIOD 1990-2100
A. F. Bouwman, G. J. VanDenBorn, and R. J. Swart May 1992 106 p
See also PB92-209097
(PB93-194819; RIVM-222901004) Avail: CASI HC A06/MF A02

The report presents part of the results of a study carried out by the RIVM for the ESCAPE project 'Development of a Framework for the Evaluation of Policy Options to Deal with the Greenhouse Effect'. The report describes a preliminary study carried out to provide a basis for the development of the IMAGE Land Use Model. The main purpose of the study is to assess the relations existing between various land use changes and agricultural processes, to outline the trade-offs between the different policy options, and to evaluate the impact of different strategies to control emissions related to land use. The results for 1990 have been used to calibrate the model for the base year. The projections presented in the report have been used to test the scenarios developed with the IMAGE Land Use Model. INCLUSION OF A THREE-DIMENSIONAL WASHOUT COEFFICIENT IN ADPIC
E. Naeslund and H. Holmstroem May 1993 20 p
(Contract W-7405-eng-48)
(DE93-018499; UCRL-ID-114054) Avail: CASI HC A03/MF A01

In ADPIC, the deposition emerging from washout has thus far been modelled rather crudely, since the only option has been to turn the rain on and off at different times. This kind of modelling is particularly unsatisfactory when ADPIC is used to model continuous releases over long periods of time. The assumption of simultaneous rain throughout such a large plume is simply not true. In this report a modified version of ADPIC with a three-dimensional (3-D) washout coefficient is presented. The effect of space variable precipitation is examined via two separate releases that are simulated for a period of 48 hours: one continuous 'Chernobyl-like source' release and one instantaneous 'nuclear explosion-like' release. Simulations with both the new and old formulation are made and the resulting deposition patterns are compared. DOE

ORGANIC CARBONYL COMPOUNDS IN ALBUQUERQUE, NEW MEXICO, AIR: A PRELIMINARY STUDY OF THE EFFECTS OF OXYGENATED FUEL USE
Carl J. Popp (New Mexico Inst. of Mining and Technology, Socorro.), Lin Zhang (New Mexico Inst. of Mining and Technology, Socorro.), and Jeffrey S. Gaffney Jun. 1993 32 p Presented at the Symposium on Alternative Fuels and the Environment, Ann Arbor, MI, 28 Mar. - 2 Apr. 1993
(Contract W-31-109-eng-38)
(DE93-017748; ANL/ER/CP-80321; CONF-9303207-1) Avail: CASI HC A03/MF A01

A suite of inorganic and organic species were analyzed for four 2-4 day time periods over a year in Albuquerque, New Mexico to determine baseline conditions for organic pollutants under the current air pollution control parameters. Concentrations of low molecular weight carbonyl compounds were relatively high compared with areas such as Los Angeles. Formic acid concentrations in air samples were significant even in winter. In addition, ratios of peroxypropionyl nitrate to peroxyacyetyl nitrate are higher than expected and may be related to the use of oxygenated fuels which are used to mitigate CO concentrations. The number of CO violations in Albuquerque has decreased steadily since 1982 and the downward trend has continued since 1989 when oxygenated fuel use was mandated. It is, therefore, difficult to correlate the drop in CO violations directly to the use of oxygenated fuels when such factors as fleet turnover, woodburning controls, emissions testing and meteorological conditions also may be playing significant roles. More detailed studies are needed to determine the specific relationship between the use of oxygenated fuels and the air quality in Albuquerque, New Mexico and similar urban areas in the western United States. OIL SPREADING IN SURFACE WATERS WITH AN ICE COVER
P. D. Yapa, S. A. Weerasuriya, D. P. Belaskas, and T. Chowdhury Feb. 1993 96 p Sponsored by Geological Survey, Reston, VA
(Contracts DI-14-08-0001-G-1915; USGS-G-1915)
(PB93-190767; REPT-93-3; USGS/G-1915) Avail: CASI HC A05/MF A01

A study of oil spreading in surface waters in the presence of a floating ice cover is presented. The ice can be solid or fragmented. Both axi-symmetrical and uni-directional spreading are studied. The report describes the analytical and numerical model development, the experimental set-up, results from the laboratory experiments, and their comparison with the derived theory and the numerical simulation. To analyze the spreading of oil under solid ice, new equations are derived. These equations consider gravity (buoyancy) - inertia phase, gravity (buoyancy) - viscous phase, and the termination of spreading during the buoyancy - surface tension phase. The derivation considers both the constant discharge mode and the constant volume mode. Therefore, a complete description of the spreading phenomena from the time of initial spill to termination of spreading is presented. The emphasis of the study is on the dominant spreading mechanism for oil under ice, which is the buoyancy-viscous phase. NTIS

SPATIOTEMPORAL VARIABILITY OF NON-URBAN OZONE CONCENTRATIONS OVER THE EASTERN UNITED STATES AND ITS POTENTIAL REPLICATION BY SATELLITE DATA
B. K. Eder (Environmental Protection Agency, Research Triangle Park, NC.), S. K. LeDuc (Environmental Protection Agency, Research Triangle Park, NC.), and L. E. Truppi (Environmental Protection Agency, Research Triangle Park, NC.) 1993 28 p
(PB93-191328; EPA/600/A-93/079) Avail: CASI HC A03/MF A01

The spatial and temporal variability of the maximum 24 hourly surface ozone concentrations over the eastern United States was examined for the period 1985-1990 using Rotated Principal Component Analysis (RPCA). This led to the delineation of six contiguous subregions, each of which displayed statistically unique ozone characteristics. Examination of the time series associated with the Subregions revealed that the Great Lakes and Mid-Atlantic Subregions tend to contain a stronger seasonal cycle, with maximum concentrations occurring during the last week in June and the first week in July, respectively. The strength of this seasonality is weakened for the Northeast and South Subregions and the timing of its maximum delayed, until the end of July and the first of August, respectively. The Southwest Subregion experiences a greatly diminished seasonality, with maximum concentrations delayed until the middle of August. The seasonality found in the Florida Subregion is unique in both its strength and timing, as the highest concentrations consistently occur during the months of April and May. The time series were then deseasonalized and autocorrelations and spectral density estimates calculated, revealing that persistence is much more prevalent in the Florida, South and Southwest Subregions and less prevalent in the Northeast, Great Lakes and Mid-Atlantic Subregions. KINETICS PROGRAMS FOR SIMULATION OF TROPOSPHERIC PHOTOCHEMISTRY ON THE GLOBAL SCALE
S. Elliott, C. Y. J. Kao, R. P. Turco, and X. P. Zhao Aug. 1993 55 p
(Contract W-7405-eng-36)
(DE93-019035; LA-12539-MS) Avail: CASI HC A04/MF A01

The study of tropospheric kinetics underlies global change because key greenhouse gases are photochemically active. Modeling of tropospheric chemistry on a global scale is essential because some indirect greenhouse gases are short-lived and interact in a non-linear fashion. It is also extremely challenging, however; the global change grid is extensive in both the physical and temporal domains, and critical lower atmospheric species include the organics and their oxidized derivatives, which are numerous. Several types of optimization may be incorporated into kinetics modules to enhance their ability to simulate the complete lower atmospheric gas phase chemical system. (1) The photochemical integrator can be accelerated by avoiding matrix and iterative solutions and by establishing families. Accuracy and mass conservation are sacrificed in the absence of iteration, but atom balancing is restorable post hoc. (2) Chemistry can be arranged upon the massive grid to exploit parallel processing, and solutions to its continuity equations can be automated to permit experimentation with species and reaction lists or family definitions. Costs in programming effort will be incurred in these cases. (3) Complex hydrocarbon decay sequences can be streamlined either through structural lumping methods descended from smog investigations, which require considerable calibration, or by defining surrogates for classes of compounds, with a loss in constituent detail. From among the available options, the most advantageous permutations will vary with the specific nature of any eventual global scale study, and there is likely to be demand for many approaches. Tracer transport codes serve as a foundation upon which tropospheric chemistry packages will be tested. Encroachment of the NO(x) sphere of influence upon tropical rain forests and the upper free troposphere are two examples of specific problems to which full three-dimensional chemical simulations might be applied.

CARBON ISOTOPE BIOGEOCHEMISTRY OF METHANE FROM ANOXIC SEDIMENTS Final Technical Report
Neal E. Blair 8 Nov. 1993 166 p
(Grant NAGw-838)
(NASA-CR-194620; NAS 1.26:194620) Avail: CASI HC A08/MF A02

The isotopic composition of naturally occurring methane was used to constrain the tropospheric budget of that radiatively active gas. Numerous studies have shown that the isotopic composition is not constant, even for a specific source, and may vary temporally and spatially. The objective was to develop a process-level model that reproduced the seasonal variations in the C-13/C-12 composition of methane observed at the coastal site, Cape Lookout Bight, NC. Details of the mass balance are provided. Experiments and models designed to determine what factors incluence C-13/C-12 ratio of dissolved CO2 are reported. All the factors described were combined in a model that faithfully reproduces the seasonal C-13/C-12 variations observed at Cape Lookout. The model is described. For individual titles, see N94-19232 through N94-19235.

A CARBON ISOTOPE MASS BALANCE FOR AN ANOXIC MARINE SEDIMENT: ISOTOPIC SIGNATURES OF DIAGENESIS
Susan E. Boehme *In its* Carbon Isotope Biogeochemistry of Methane from Anoxic Sediments 8 Nov. 1993 50 p (For primary document see N94-19231 04-45)
Avail: CASI HC A03/MF A02

A carbon isotope mass balance was determined for the sediments of Cape Lookout Bight, NC to constrain the carbon budgets published previously. The diffusive, ebullitive and burial fluxes of sigma CO2 and CH4, as well as the carbon isotope signatures of these fluxes, were measured. The flux-weighted isotopic signature of the remineralized carbon (-18.9 plus or minus 2.7 per mil) agreed with the isotopic composition of the remineralized organic carbon determined from the particulate organic carbon (POC) delta(C-13) profiles (-19.2 plus or minus 0.2), verifying the flux and isotopic signature estimates. The measured delta(C-13) values of the sigma CO2 and CH4 diffusive fluxes were significantly different from those calculated from porewater gradients. The differences appear to be influenced by methane oxidation at the sediment-water interface, although other potential processes cannot be excluded. The isotope mass balance provides important information concerning the locations of potential diagenetic isotope effects. Specifically, the absence of downcore change in the delta(C-13) value of the POC fraction and the identical isotopic composition of the POC and the products of remineralization indicate that no isotopic fractionation is expressed during the initial breakdown of the POC, despite its isotopically heterogeneous composition. THE CARBON ISOTOPE BIOGEOCHEMISTRY OF (EPSILON)CO2 PRODUCTION IN A METHANOGENIC MARINE SEDIMENT
Susan E. Boehme *In its* Carbon Isotope Biogeochemistry of Methane from Anoxic Sediments 8 Nov. 1993 46 p (For primary document see N94-19231 04-45)
Avail: CASI HC A03/MF A02

To investigate the relationship between sigma(CO2) delta(C-13) values and rates of the dominant remineralization processes at the organic-rich field site of Cape Lookout Bight, NC, the isotopic composition of porewater sigma(CO2) was measured on a seasonal basis. The sigma(CO2) delta(C-13) values varies seasonally in response to changes in rates of sulfate reduction and methanogenesis, the dominant remineralization processes at this site. A tube incubation experiment was also performed to determine the isotopic signature of the sigma(CO2) produced by sulfate reduction and methanogenesis. The delta(C-13) of the sigma(CO2) produced in the sulfate reduction zone determined from the tube incubation was -14.3 plus or minus 1.9, a value enriched in C-13 relative to the labile organic fraction. The C-13-enrichment may be caused by low rates of methanogenesis occurring in the sulfate reduction zone. The delta(C-13) of the sigma(CO2) produced in the methanogenic zone was estimated to be +44 per mil, whereas the co-produced methane was -65 per mil. The fractionation factor for CO2 reduction was calculated to be 1.055, a value in agreement with previous estimates at this site. The measured concentration and delta(C-13) of the sigma(CO2) at Cape Lookout was closely reproduced by a diagenetic model using the measured rates of sulfate reduction and sigma(CO2) production, and the isotopic signature of the sigma(CO2) production in the two biogeochemical zones. THE CARBON ISOTOPE BIOGEOCHEMISTRY OF METHANE PRODUCTION IN ANOXIC SEDIMENTS. 1: FIELD OBSERVATIONS
Neal E. Blair, Susan E. Boehme, and W. Dale Carter, Jr. *In its* Carbon Isotope Biogeochemistry of Methane from Anoxic Sediments 8 Nov. 1993 33 p (For primary document see N94-19231 04-45)
Avail: CASI HC A03/MF A02

The natural abundance C-13/C-12 ratio of methane from anoxic marine and freshwater sediments in temperate climates varies seasonally. Carbon isotopic measurements of the methanogenic precursors, acetate and dissolved inorganic carbon, from the marine sediments of Cape Lookout Bight, North Carolina were used to determine the sources of the seasonal variations at that site. Movement of the methanogenic zone over an isotopic gradient within the dissolved CO2 pool appears to be the dominant control of the methane C-13/C-12 ratio from February to June. The onset of acetoclastic methane-production is a second important controlling process during mid-summer. An apparent temperature dependence on the fractionation factor for CO2-reduction may have a significant influence on the isotopic composition of methane throughout the year. Author (revised)

FACTORS THAT CONTROL THE STABLE CARBON ISOTOPIC COMPOSITION OF METHANE PRODUCED IN AN ANOXIC MARINE SEDIMENT
M. J. Alperin (North Carolina Univ., Chapel Hill.), Neal E. Blair, D. B. Albert (North Carolina Univ., Chapel Hill.), T. M. Hoehler (North Carolina Univ., Chapel Hill.), and C. S. Martens (North Carolina Univ., Chapel Hill.) *In its*

Carbon Isotope Biogeochemistry of Methane from Anoxic Sediments 8 Nov. 1993 21 p Repr. from Global Biogeochemical Cycles, v. 6, no. 3, Sep. 1992 p 271-291 (For primary document see N94-19231 04-45)
Avail: CASI HC A03/MF A02

The carbon isotopic composition of methane produced in anoxic marine sediment is controlled by four factors: (1) the pathway of methane formation, (2) the isotopic composition of the methanogenic precursors, (3) the isotope fractionation factors for methane production, and (4) the isotope fractionation associated with methane oxidation. The importance of each factor was evaluated by monitoring stable carbon isotope ratios in methane produced by a sediment microcosm. Methane did not accumulate during the initial 42-day period when sediment contained sulfate, indicating little methane production from 'noncompetitive' substrates. Following sulfate depletion, methane accumulation proceeded in three distinct phases. First, CO_2 reduction was the dominant methanogenic pathway and the isotopic composition of the methane produced ranged from -80 to -94 per thousand. The acetate concentration increased during this phase, suggesting that acetoclastic methanogenic bacteria were unable to keep pace with acetate production. Second, acetate fermentation became the dominant methanogenic pathway as bacteria responded to elevated acetate concentrations. The methane produced during this phase was progressively enriched in C-13, reaching a maximum delta(C-13) value of -42 per thousand. Third, the acetate pool experienced a precipitous decline from greater than 5 mM to less than 20 micro-M and methane production was again dominated by CO_2 reduction. The delta(C-13) of methane produced during this final phase ranged from -46 to -58 per thousand. Methane oxidation concurrent with methane production was detected throughout the period of methane accumulation, at rates equivalent to 1 to 8 percent of the gross methane production rate. Thus methane oxidation was too slow to have significantly modified the isotopic signature of methane. A comparison of microcosm and field data suggests that similar microbial interactions may control seasonal variability in the isotopic composition of methane emitted from undisturbed Cape Lookout Bight sediment. The Clean Air Act of 1990 requires the monitoring of air toxics including those from incinerator emissions. Continuous emission monitors (CEM) would demonstrate the safety of incinerators and address public concern about emissions of hazardous organic compounds. Fourier transform infrared (FTIR) spectroscopy can provide the technology for continuous emission monitoring of stacks. Stack effluent can be extracted and analyzed in under one minute with conventional FTIR spectrometers. Passive-remote FTIR spectrometers can detect certain emission gases over 1 km away from a stack. The authors will discuss advances in both extractive and passive-remote FTIR technology. Extractive systems are being tested with EPA protocols, which will soon replace periodic testing methods. Standard operating procedures for extractive systems are being developed and tested. Passive-remote FTIR spectrometers have the advantage of not requiring an extracted sample; however, they have less sensitivity. The authors have evaluated the ability of commercially available systems to detect fugitive plumes and to monitor carbon monoxide at a coal-fired power plant. DOE

Over the last two decades, Mexico City, like many large industrial and populous urban areas, has developed a serious air pollution problem, especially during the winter months when there are frequent temperature inversions and weak winds. The deterioration in air quality is the result of several factors. The basin within which Mexico City lies is Mexico's center of political, administrative, and economic activity, generating 34% of the gross domestic product and 42% of the industrial revenue and supporting a population which is rapidly approaching the 20 million mark. The basin is surrounded by mountains on three sides which inhibit rapid dispersal of pollutants. Emissions from the transportation fleet (more than 3 million vehicles) are one of the primary pollution sources and are mostly uncontrolled. Catalytic converters are just now being introduced into the fleet. The Mexico City Air Quality Research Initiative is an international collaborative project between the Los Alamos National Laboratory and the Mexican Petroleum Institute dedicated to the investigation of the air quality problem in Mexico City. The main objective of the project is to identify and assess the cost and benefits of major options being proposed to improve the air quality. DOE

CROSSED MOLECULAR BEAM STUDIES OF ATMOSPHERIC CHEMICAL REACTION DYNAMICS Ph.D. Thesis
Jing-Song Zhang Apr. 1993 223 p
(Contract DE-AC03-76SF-00098)
(DE93-019246; LBL-34297) Avail: CASI HC A10/MF A03

The dynamics of several elementary chemical reactions that are important in atmospheric chemistry are investigated. The reactive scattering of ground state chlorine or bromine atoms with ozone molecules and ground state chlorine atoms with nitrogen dioxide molecules is studied using a crossed molecular beam apparatus with a rotatable mass spectrometer detector. The $Cl + O_3$ yields $ClO + O_2$ reaction has been studied at four collision energies ranging from 6 kcal/mole to 32 kcal/mole. The derived product center-of-mass angular and translational energy distributions show that the reaction has a direct reaction mechanism and that there is a strong repulsion on the exit channel. The ClO product is sideways and forward scattered with respect to the Cl atom, and the translational energy release is large. The Cl atom is most likely to attack the terminal oxygen atom of the ozone molecule. The $Br + O_3$ yields ClO $+ O_2$ reaction has been studied at five collision energies ranging from 5 kcal/mole to 26 kcal/mole. The derived product center-of-mass angular and translational energy distributions are quite similar to those in the $Cl + O_3$ reaction. The $Br + O_3$ reaction has a direct reaction mechanism similar to that of the $Cl + O_3$ reaction. The electronic structure of the ozone molecule seems to play the central role in determining the reaction mechanism in atomic radical reactions with the ozone molecule. The $Cl + NO_2$ yields $ClO + NO$ reaction has been studied at three collision energies ranging from 10.6 kcal/mole to 22.4 kcal/mole. The center-of-mass angular distribution has some forward-backward symmetry, and the product translational energy release is quite large. The reaction proceeds through a short-lived complex whose lifetime is less than one rotational period. The experimental results seem to show that the Cl atom mainly attacks the oxygen atom instead of the nitrogen atom of the NO_2 molecule. DOE

FIBER OPTIC RAMAN SPECTROGRAPH FOR IN SITU ENVIRONMENTAL MONITORING
M. M. Carrabba Nov. 1992 35 p Prepared for ANL, IL
(Contract W-31-109-eng-38)
(DE93-019466; DOE/CH-9205) Avail: CASI HC A03/MF A01

This report discusses the development and testing of a small laboratory prototype field Raman spectrometer which can be used with a fiber optic sampling probe incorporating substrates tailored for surface enhanced Raman spectroscopy (SERS) for low level detection of chemical species. The report also discusses demonstration of apparatus for both laboratory and field environmental samples typical of DOE environmental restoration sites. Preliminary results establish a new technique which can be used in the field to identify and profile in situ a wide variety of pollutants at the action levels required for remediation. DOE

The potential of augmented carbon sinks to decrease atmospheric levels of carbon dioxide has proved attractive to many government policy makers, politicians and industry representatives. Consequently, several proposals for new laws, both domestic and international, have recognized the CO2 emitters who are encouraged or required to reduce levels of emissions should also be allowed to offset their emissions by sequestering carbon in forest stands. This idea is described. DOE

Results from a workshop which compared dimethyl sulfide (DMS), SO2 and sulfate aerosol with the predictions of the global tropospheric sulfur model developed within the European research project GLOMAC (Global Modeling of Atmospheric Chemistry) are presented. The exercise had two primary aims: validating the model and evaluating the usefulness of experiments for refining this and other models. The comparisons indicate several areas where the model has to be improved. In particular, improvements in both emission estimates and description of chemical processes are necessary in order to improve the simulation of seasonal variability. Furthermore, the calculated non-sea-salt-sulfate concentrations in the upper troposphere are much higher than the very few available observations. If available concentrations are representative, the treatment of volcanic emissions and vertical transport may have to be improved. On the measurement side the following points are made: the estimates of the emission of DMS from the oceans have to be improved. Further measurements are necessary in order to better characterize the concentration of non-sea-salt sulfate in the free troposphere. The importance of sampling more than one sulfur species at the same location is stressed. ESA

Synthetic radiance spectra in the mid-infrared of the electromagnetic spectrum were calculated at a spectral resolution of about 0.1 cm for various observation geometries. Separability of the lines was studied for a number of trace gases, such as water vapor, ozone, carbon monoxide, methane, nitrous oxide, nitrogen oxides, sulfur dioxide, fluorochlorocarbons, etc. Separation of the spectral lines was complicated by the high water vapor absorption and pressure broadening of the lines in the troposphere. The separated spectral features of the individual gases were investigated with regard to their sensitivity to changes of the respective trace gas concentrations and to errors on the temperature profile and surface temperature. The effect of calibration errors and spectral noise on the spectra and on the accuracy of the trace concentrations to be determined were estimated, as was the influence of unprecise spectroscopic data. To determine the atmospheric layers most contributing to the radiance signal, contribution functions were calculated. The influence of cirrus clouds on the IR spectra was investigated. To avoid errors when determining the integral gas mass, this influence depending both on the thickness and the height of the clouds must be taken into account in the evaluation of the spectra. Horizontal sounding measurements from satellites serve to determine trace gas concentrations in the stratosphere and the upper troposphere with a good vertical, but a limited horizontal, resolution over large altitude ranges with an accuracy of 10 to 20. Horizontal soundings of the troposphere are much more obstructed by the presence of clouds than nadir soundings. ESA

The Images model, a numerical chemistry/transport model of tropospheric trace gases is presented. The three dimensional distributions of about 40 chemical species are calculated, with focus on the key compounds governing the oxidation capacity of the atmosphere, ozone and hydroxl. Images is a powerful tool to study the possible perturbations of the oxidation capacity of the atmosphere. The model domain is the global troposphere and the lower stratosphere below 50 mbars. Tropospheric chemistry is discussed. The chemical degradation of several important organic species is studied. A simplified chemical scheme is proposed and used in the global model. Images is used to study present day and preindustrial chemistry of the troposphere. The results agree with available experimental data. The possible causes of the increase of atmospheric concentrations of methane and ozone are discussed. The results show that the mean hydroxyl concentration did not change very much since the preindustrial era. Ozone increased rapidly at the vicinity of the Earth surface. The tropospheric ozone burden increased by about a quarter. ESA

Absorption cross sections were obtained in the infrared atmospheric window, between 600 and 1500/cm, for 10 alternative hydrohalocarbons: HCFC-22, HCFC-123, HCFC-124, HCFC-141b, HCFC-142b, HCFC-225ca, HCFC-225cb, HFC-125, HFC-134a, and HFC-152a. The measurements were made at three temperatures (287K, 270K and 253K) with a Fourier transform spectrometer operating at 0.03/cm apodized resolution. Integrated cross sections were introduced into a two dimensional radiative chemical dynamical model in order to calculate the global warming potential of each gas. ESA

The 1991 ASCOT (Atmospheric Studies in Complex Terrain) field study in the vicinity of the Department of Energy's Rocky Flats Plant, Colorado, was conducted to study the local and regional circulations and their interactions with synoptic flows over the complex terrain of the Rocky Mountains Colorado Front range. The study was combined with the Rocky Flats Winter Validation Study (WVS) which had similar objectives. Tracer plumes were released as part of this field campaign over the period of February 3-19, 1991 from the Rocky Flats Plant. Twelve intensive experiments, centered around eleven-hour long surface releases of sulfur hexafloride (SF6) tracer material, were conducted by teams from a number of national laboratories, government agencies, and private contractors. One-hourly averaged tracer concentrations were collected from approximately 170 surface samplers deployed along two concentric circles at a radius of 8 km and 16 km from the release location. The concentration patterns resulting from the transport and turbulent diffusion of the SF6 traces plumes within the atmospheric boundary layer during two night-time, one morning transition, and one day-time period were simulated for this paper. The scenarios selected represent the first-choice of all twelve experiments to be addressed, based on the quality and completeness of the collected data base and the presence of the desired meteorological conditions. ON A CONFORMAL PERFECT FLUID IN THE CLASSICAL VACUUM

H. Culetu Feb. 1993 8 p

(DE93-624797; IC-93/23) Avail: CASI HC A02/MF A01 (US Sales Only)

A possible existence of a conformal perfect fluid in the classical vacuum is investigated. It is shown, contrary to Madsen's opinion, that the scalar field stress tensor acquires a perfect fluid form even with a nonminimal coupling (xi = 1/6) in the Einstein Lagrangian, provided the geometry is the Lorentzian analogue of the Euclidean Hawking wormhole. In addition, our T(sub (mu)(nu)) equals (up to a constant factor) the vacuum expectation value of the Fulling stress tensor for a massless scalar field and Visser's one concerning transversible wormholes. On the other side of the light cone, there is a coordinate system (the dimensionally reduced Witten bubble) where the stress tensor becomes diagonal. DOE

Optical pumping of the ionospheric plasma by high frequency radio waves produces a state of turbulence. Several consequences of the pumping are considered. At reflection altitude the plasma is thought to be dominated by parametric instabilities and strong turbulence; these are both encapsulated in the so called Zakharov equations. The Zakharov equations are derived and generalized from kinetic theory. Limits of validity, corrections to the ion sound speed, effective ponderomotive force, nonlinear damping, and other generalizations are included. As an example of the difference a kinetic approach makes, the threshold for parametric instabilities is seen to be lowered in a kinetic plasma. Mostly relevant to the upper hybrid layer is the recent discovery in the pumping experiments of Stimulated Electromagnetic Emissions (SEE). In particular one feature of SEE which occurs around the cyclotron harmonics and depends on density striations is investigated. The observed frequency of emission, dependency on striations, time evolution, and cutoff frequency below which the feature does occur are explained. Two theoretical approaches are taken. The first is a parametric three wave decay instability followed by a nonlinear mixing to produce SEE. Thresholds for the instability are well within experimental capacity. The second, less orthodox, approach, is a finite amplitude model. The finite amplitude model goes beyond the traditional parametric approach by being able to predict radiated power output. Miscellaneous aspects of a turbulent ionosphere are also examined. The dependency of the scattering cross section of a turbulent plasma upon higher order perturbations is considered. In a turbulent plasma, density gradients steeper than charateristic plasma scales may develop. The case of calculating the dielectric permittivity for a linear gradient of arbitary steepness is considered. ESA

HETEROGENEOUS SLIP AND RUPTURE MODELS OF THE SAN ANDREAS FAULT ZONE BASED UPON THREE-DIMENSIONAL EARTHQUAKE TOMOGRAPHY Ph.D. Thesis

W. Foxall Nov. 1992 178 p

(Contract DE-AC03-76SF-00098)

(DE93-015037; LBL-33984) Avail: CASI HC A09/MF A02

Crystal fault zones exhibit spatially heterogeneous slip behavior at all scales, slip being partitioned between stable frictional sliding, or fault creep, and unstable earthquake rupture. An understanding the mechanisms underlying slip segmentation is fundamental to research into fault dynamics and the physics of earthquake generation. This thesis investigates the influence that large-scale along-strike heterogeneity in fault zone lithology has on slip segmentation. Large-scale transitions from the stable block sliding of the Central 4D Creeping Section of the San Andreas fault to the locked 1906 and 1857 earthquake segments takes place along the Loma Prieta and Parkfield sections of the fault, respectively, the transitions being accomplished in part by the generation of earthquakes in the magnitude range 6 (Parkfield) to 7 (Loma Prieta). Information on sub-surface lithology interpreted from the Loma Prieta and Parkfield three-dimensional crustal velocity models computed by Michelini (1991) is integrated with information on slip behavior provided by the distributions of earthquakes located using the three-dimensional models and by surface creep data to study the relationships between large-scale lithological heterogeneity and slip segmentation along these two sections of the fault zone. The development and the application of an atmospheric correction method for remotely sensed images of land surfaces with high spatial resolution are presented. An approximate solution of radiative transfer including non Lambertian reflection from the ground and the phenomenon of adjacency effect is presented. The atmosphere was a one layer model containing three different types of aerosol (urban, rural, maritime) which can be bailed out alternatively. The aerosol-optical depth and the single scattering albedo were taken to adapt the model to the actual state of the atmosphere. The validity of the approximative solution and the atmospheric model was checked using LOWTRAN calculations of global irradiance and diffuse transmission. The disagreement between the LOWTRAN data and those computed with the presented model is very low (lower than 5 percent). A strategy to estimate the optical depth from image data is developed using the influence of aerosol to the variability of the measured data. As a necessary reference value the variability of the ground reflectance which can be derived using structure measures with global transformation invariance was considered. They were computed by means of fractal geometry but they were not generalized dimensions due to the arbitrarity of covering a set containing many but a finite number of points. The application of the atmospheric correction model to TM (Thematic Mapper) satellite data shows good agreement between ground measurements and the results of an alternative algorithm for all TM channels of the solar spectrum except for channel 1. The data processing and error sources of the Earth Radiation Budget Experiment (ERBE), which provides global information on the radiation properties of the Earth's atmosphere and surface, are addressed. The data processing scheme, which is used to convert raw radiometer counts into values for radiant exitance at the top of the atmosphere, is described and error sources are evaluated. When possible, the magnitude of the errors is estimated. This is proven difficult, because the errors depend on surface characteristics, atmospheric conditions, latitude, solar zenith angle, and the viewing geometry. Most scanner measurements were processed and validated. When using monthly mean scanner values one should be aware that specific regions may show considerable biased values of the radiant existance. The standard deviation in the regional monthly mean values is of the order of 5 W/sq m. Instantaneous scanner values should be used with caution, because errors in the radiant existance values for shortwave radiation in the order of 45 W/sq m are no exception. The error is highly dependent on viewing geometry, atmospheric conditions, and latitude. Nonscanner data are not fully validated yet. Probably the errors will exceed those of the scanner. ESA

Atmospheric turbulence degrades a coherent laser beam when it propagates through the atmosphere. Measurements of the distribution of atmospheric turbulence provide insight into the underlying mechanisms that produce optical turbulence and suggest possible means to overcome or circumvent the effects of such turbulence. A variety of acoustic, optical, and thermal probe instruments provide measurements of atmospheric turbulence. Of these, the acoustic echosounder can measure atmospheric density and velocity irregularities. During the course of previous work, questions arose concerning the calibration of the NPS echosounder. The echosounder appears to detect a higher level of atmospheric turbulence than do other instruments used at the same altitude. This resulting overestimation of atmospheric turbulence could significantly influence programs such as the Advanced Electro-Optic Site (AEOS), a proposed 4 m telescope to be built in Hawaii. This thesis will attempt to identify key components contributing to the sounder calibration including the transducer transmit and receive efficiencies as well as their dependence on pressure and atmospheric density. Additionally a modified acoustic echosounder equation will be developed which more accurately profiles the atmospheric turbulence measured by such a sounder. DTIC

A cluster analysis method has been applied to a data set consisting of thousands of events recorded at ARCESS. Northern Scandinavia has been divided into smaller areas in which seismic events were organized into groups of similar events. The locations of these groups have been compared with known mine locations in Northern Scandinavia. Many of these groups have been associated with these mines. For comparison purposes, reference events were defined for each group. DTIC

The earth's ozone layer occurs in the stratosphere, primarily between 10 and 30 miles altitude. The amount of ozone, O, present is the result of a balance between production and destruction processes. Experiments have shown that natural processes such as auroras create molecules that destroy O. One family of such molecules is called 'odd nitrogen' of which nitric oxide (NO) is an example. Because the HAARP (HF Active Auroral Research Program) facility is designed to mimic and investigate certain natural processes, a study of possible effects of HAARP on the ozone layer was conducted. The study used a detailed model of the thermal and chemical effects of the high power HF beam, which interacts with free electrons in the upper atmosphere above 50 miles altitude. It was found only a small fraction of the beam energy goes into the production of odd nitrogen molecules, whereas odd nitrogen is efficiently produced by auroras. Since the total energy emitted by HAARP in the year is some 200,000 times less than the energy deposited in the upper atmosphere by auroras, the study demonstrates that HAARP HF beam experiments will cause no measurable depletion of the earth's ozone layer. GLOBAL ZONES OF PARTICLE PRECIPITATION AS OBSERVED EXOS-C Final Annual Report, 31 Jul. 1989 - 30 Jun. 1993
31 Jul. 1993 28 p
(Contract F49620-89-C-0071)
(AD-A268758; SESC-USPB-02-93; AFOSR-93-0669TR) Avail: CASI HC A03/MF A01

A study of the precipitation of protons (0.64 - 35 MeV) and electrons (0.19 - 3.2 MeV) in the northern auroral zone based on the observations of EXOS-C satellite during 1994-86 reveal that the global peak flux profile follows the global minimum magnetic field profile with a full-width-at-half-maximum (FWFM) of approx 7 deg for the proton zone and approximately 5 deg for the electron zone. Maximum particle flux occurs in the longitude range of 36 deg-72 deg, and minimum in 216 deg-252 deg. Both the kinds of fluxes show the altitude dependence with the electron flux having pronounced exponential dependence. The instrument (S-1 telescope) response function correlates very well with the angle-chi between the telescope axis and the local magnetic field direction. The particle flux depends on chi in the same way as the particle pitch angle distribution sin(sup n)alpha. It is found that the variation of flux with L depends on the angle chi. Both these types of flux varies with the local time having peak values at early morning hours. A study of the monthly variation shows that fluxes of both protons and electrons show significantly relative variation and also a periodicity of maximum and minimum. This long-term variation is thought to be related with magnetospheric conditions. DTIC

HIGH RESOLUTION GEOLOGICAL SITE CHARACTERIZATION UTILIZING GROUND MOTION DATA Final Report, 1 Nov. 1988 - 31 Jan. 1993
Mike Craven and Brian W. Stump 9 Jul. 1993 235 p
(Grant AF-AFOSR-0176-89)
(AD-A268926; SMU-G-11; AFOSR-93-0652TR) Avail: CASI HC A11/MF A03

Experimentally produced surface waves at high frequencies (5-50 Hz) and short source-receiver distances (5-100 m) are utilized in the determination of shallow shear structures in geological materials. This procedure is shown to provide a high resolution picture of these shallow materials which may be of interest to the engineering and environmental community. Love waves are generated by the Sh source, SWIG, developed under this contract. Rayleigh waves are produced by the commercially available Betsy Seisgun. Group velocity determination includes multiple filter analysis with the application of narrow band Gaussian filters to the data and determination of the peaks in the resulting amplitude envelopes. Phase velocities are determined from the array data using the p-omega technique. Dispersion data is inverted to refine the velocity estimates and produce an attenuation model. DTIC

HISTORICAL SEISMICITY OF HAINAUT, FLANDERS AND ARTOIS [LA SEISMICITE HISTORIQUE DU HAINAUT, DE LA FLANDRE ET DE L'ARTOIS]
Pierre Alexandre *In its* Belgian Royal Observatory Communications, Series A, No. 104, Geophysics Series No. 175 Dec. 1990 15 p Repr. from Annales de la Societe Geologique de Belgique, v. 112, no. 2, 1989 p 329-343 In FRENCH (For primary document see N94-18622 04-46)
Avail: CASI HC A03/MF A01

The historical seismicity of Hainaut, Flanders and Artois (Belgium, France) was only known to the present day by incomplete compilations without critical value. A revision of sources and a new survey of texts connected with past earthquakes has enabled the elimination of seismic faults (about fifteen from 330 to 1671, and specially the so called disaster of 1317 in eastern Flanders) and the proposal of a more correct localization for the earthquakes of 1000, 1081, and 1095. On the other hand, a new catalog of the earthquakes occurring from 700 to 1800 in the investigated area was elaborated. With the help of copious documentation, it was possible to make a more detailed study of the three great earthquakes of 1382, 1449, and 1580, which affected both England and the Continent. ESA

CURRENT (1985-1988) SEISMIC ACTIVITY IN BELGIUM: COMPARISON WITH HISTORICAL AND INSTRUMENTAL SEISMIC DATA Seismotectonic Analysis [L'ACTIVITE SEISMIQUE ACTUELLE (1985-1988) EN BELGIQUE. COMPARAISON AVEC LES DONNEES DE SEISMICITE HISTORIQUE ET INSTRUMENTALE: ANALYSE SEISMOTECTONIQUE]
T. Camelbeeck *In its* Belgian Royal Observatory Communications, Series A, No. 104, Geophysics Series No. 175 Dec. 1990 19 p Repr. from Annales de la Societe Geologique de Belgique, v. 112, no. 2, 1989 p 347-365 In FRENCH (For primary document see N94-18622 04-46)
Avail: CASI HC A03/MF A01

Reliable information concerning the historical and instrumental seismicity in Belgium is discussed in comparison with the more recent data of microseismicity. The Brabant Massif and the north of France are characterized by an important historical seismicity. Since the Middle Ages, four earthquakes caused considerable concern in that region. The actual seismic activity is not well known due to the lack of seismological stations. It is thus impossible to base the tectonic pattern on seismological data. The seismic activity in Hainaut was analyzed with the data of the seismic sequence near Dour in 1987 and the reexamination of the bigger earthquakes having occurred since 1965. The seismogenic layer is limited to the 8 first km of the crust. The occurrence under the form of swarms or sequences is an evidence of strong fracturation. The fault-plane solution of the Dour earthquake in 1987 indicates an almost north-south extension at this place of the Mons Basin. The focal mechanisms of 5 earthquakes in the center region shows a north-west south-east oriented maximal horizontal compressive stress. This information is in agreement with the dextral strike-slip of the 'shear zone of north-Artois' made conspicuous by geology. Important information about the seismotectonics in the eastern part of Belgium is given by the study of the actual microseismicity with a dense network of seismological stations. The fault-plane solution of the Malmedy (12 May 1985, M (sub L) = 2.5) earthquake indicates a south-west north-east extension along a fault of rhenish orientation. This is a favorable argument to the hypothesis of the prolongation across the Ardennes of the quaternary faults of the lower Rhine embayment. The analysis of the Bilzen (16 Jul. 1985, M(sub L) = 3.0), Gulpen (17 Oct. 1988, M(sub L) = 3.5), and Sprimont (27 Dec. 1988, M(sub L) = 3.6) earthquakes supplies new information on the complex tectonics of the Liege region. Possible gravimetric contributions at the Belgian scale are considered in the context of recent technical evolutions and data availability. The first question is as follows: can we reasonably suspect in Belgium some secular variations of gravity or rapid variations of pre- or post seismic origin? We can believe that if these phenomena exist, their amplitudes are such that they are not detectable by the conventional methods of field gravimetry, even if the precision of these techniques has dramatically increased in the last few years. Other instruments, for example absolute and superconducting gravimeters, seem much more adequate for this kind of investigation. The

second question is as follows: for which purpose can gravimetry be useful in the future (except of course for geophysical interpretation)? The answer is contained in a quite old geodetic concept: the geoid. The techniques of satellite positioning have become so accurate that we can presently level with the precision of a few cm over distances of 20 km or more. This enables us to discover crustal movements on a relatively large scale. The relation between satellite height determination and precise levelling requires knowledge about the conventional reference surface, the 'geoid,' with the same accuracy. At this moment only gravimetry is able to objectively produce such a surface. A summary of the data available in Belgium and those needed in order to reach the level of precision required is presented.

CURRENT POSITIONING POSSIBILITIES BY SPATIAL TECHNIQUES AND THE ROYAL OSERVATORY OF BELGIUM PROGRAM [LES POSSIBILITES ACTUELLES DE POSITIONNEMENT PAR LES TECHNIQUES SPATIALES ET LE PROGRAMME DE L'OBSERVATOIRE ROYAL DE BELGIQUE]

P. Paquet *In its* Belgian Royal Observatory Communications, Series A, No. 104, Geophysics Series No. 175 Dec. 1990 6 p Repr. from Annales de la Societe Geologique de Belgique, v. 112, no. 2, 1989 p 453-458 In FRENCH (For primary document see N94-18622 04-46)
Avail: CASI HC A02/MF A01

Since 1972, the Royal Observatory of Belgium has been involved in a space geodetic program aiming to determine the Earth's rotational parameters and the geocentric coordinates of terrestrial sites. With respect to the center of mass of the Earth, the cartesian coordinates are currently determined with a precision close to 10 to 20 cm; between terrestrial sites this method does not improve the precision of relative positioning and is more or less not useful for geodynamics studies on regional scales. Since 1983, new satellites have been progressively launched and will form the Global Positioning System (GPS); in its final issue, expected for 1991-1992, it will be composed of at least 18 satellites. For several years, experiences have demonstrated the capability of this new system to obtain precision close to the centimeter level over distances extended till 30 km. For larger distances, the precision decreases as a consequence of the perturbations of the ionosphere on the radio signal propagation and the lack of accuracy of the orbit determination; however, recent technological improvements of the ground receivers indicate that a precision of a few units of 10(exp -8) power are obtainable; that is equivalent to one centimeter over 1000 km. The Royal Observatory of Belgium has just acquired two receivers with, in a first phase, the following objectives: integration of the fundamental Belgian geodetic mark in the international networks; between two Belgian sites development of a calibration basis with systematic measurements between the two stations; and participation in geophysical programs such as regular controls of seismological stations and first order gravimetric network. ESA

INSTRUMENTATION DEVELOPED AT THE ROYAL OBSERVATORY OF BELGIUM FOR MEASURING SLOW DISPLACEMENTS OF THE EARTH [INSTRUMENTATIONS DEVELOPPEES A L'OBSERVATOIRE ROYAL DE BELGIQUE POUR LA MESURE DE DEFORMATIONS LENTES DU SOL]

M. vanRuymbeke *In its* Belgian Royal Observatory Communications, Series A, No. 104, Geophysics Series No. 175 Dec. 1990 6 p Repr. from Annales de la Societe Geologique de Belgique, v. 112, no. 2, 1989 p 459-464 In FRENCH (For primary document see N94-18622 04-46)
Avail: CASI HC A02/MF A01

A review of the gravimeters, clinometers, extensometers, capacitative sensors, and high resolution thermometers is presented. The geophysical instruments were originally built with mechanical and electrical transducers. The precision was limited, and only large signals were observed. The introduction of electronics for transducers, amplifiers, filters, recorders, time signals, and data processing has improved the possibilities. For very small displacements, capacitative transducers are used. The feedback systems with digital filter improve tidal registrations. It is important to measure the temperature and atmospheric pressure influences. ESA

AN INVESTIGATION OF METHODS FOR UPDATING IONOSPHERIC SCINTILLATION MODELS USING TOPSIDE IN-SITU PLASMA DENSITY MEASUREMENTS Final Report, 1 May 1990 - 30 Apr. 1993

James A. Secan 1 May 1993 110 p
(Contract F19628-90-C-0072)
(AD-A269872; NWRA-CR-93-R096; PL-TR-93-2122) Avail: CASI HC A06/MF A02

Modern military communication, navigation, and surveillance systems depend on reliable, noise free transionospheric radio-frequency channels and can be severely impacted by small-scale electron-density irregularities in the ionosphere. This report summarizes the results of a three year investigation into the methods for updating ionospheric scintillation models using observations of ionospheric plasma-density irregularities measured by the DMSP Scintillation Meter (SM) sensor. Results are reported from the analysis of data from a campaign conducted in January 1990 near Tromso, Norway, in which near coincident in-situ plasma-density and transionospheric scintillation measurements were made. Estimates for the level of intensity and phase scintillation on a transionospheric UBF radio link in the early-evening auroral zone were calculated from DMSP SM data and compared to the levels actually observed. Results are also presented from a comparison with scintillation observations made with a coincident DNA Polar BEAR satellite pass. DTIC

A COMPARISON OF SINGLE-STATION BACKAZIMUTH ESTIMATES WITH REGIONAL EVENT LOCATIONS IN THE CENTRAL APPALACHIANS

Martin C. Chapman, Shaosong Huang, and J. A. Snoke 30 Jun. 1993 52 p
(Contract F19628-92-K-0029)
(AD-A269897; AD-E201600; PL-TR-93-2126; SR-1) Avail: CASI HC A04/MF A01

The study examines the accuracy of single-station backazimuth measurements from polarization analysis of near regional P wave arrivals. The data set consists of 37 signals from mining explosions in the distance range 100 to 300 km, recorded at station BLA, Blacksburg, Virginia. The station-source backazimuth estimates derived from the three-component station are compared with results derived from independent information, primarily from regional network epicenter locations. For signal/noise ratios in excess of 2.0, the mean backazimuth error of the single-station estimate is 6 degrees (for sources in the northwest quadrant) and the standard deviation is 21 degrees. Generally, only the initial (1 second or less) portion of the P wave arrival is polarized in the source-station azimuth. Off-azimuth arrivals consisting of converted and scattered energy appear early in the P coda. Emergent P wave arrivals from the delay-fired explosions, combined with steep apparent angles of incidence (averaging 22 degrees) complicate the single-station, three-component location problem. WORK PLAN FOR THE MARINE AEROSOL PROPERTIES AND THE THERMAL IMAGER PERFORMANCE TRIAL (MAPTIP)

D. R. Jensen, G. DeLeeuw, and A. M. VanEjik Sep. 1993 112 p
(AD-A270026; NRAD/TD-2573) Avail: CASI HC A06/MF A02

Atmospheric aerosol and infrared sea and terrain background models are of special importance for the assessment of the performance of electro-optical (EO) systems. The degradation of the radiance contrast between a target and its natural background, as viewed by an infrared sensor, is determined by the constituents of the intervening atmosphere that absorb and scatter the radiation. The assessment, therefore, depends upon the accuracy of the atmospheric models being used in the propagation prediction codes. The performance of the electro-optical systems is further degraded by turbulence and refractivity effects, causing blurring, scintillation, beam wander, mirages, etc. In thermal imagers, these effects may result in image distortion, contrast reduction, and other detection problems.

THE USE OF VELOCITY SPECTRA FOR STACKING RECEIVER FUNCTIONS WITH APPLICATION TO IRIS/IDA STATIONS OBNINSK (OBN) AND ARTI (ARU), RUSSIA Final Report, 1 Dec. 1991 - 30 Oct. 1992

H. Gurrola, J. B. Minster, T. Owens (South Carolina Univ., Columbia.), and

H. Given 30 Oct. 1992 58 p
(Contract F19628-90-K-0045)
(AD-A269087; PL-TR-93-2069) Avail: CASI HC A04/MF A01

To improve signal to noise ratio (SNR), it is typical to stack receiver functions calculated from events at similar distances and back azimuths. We have adapted the velocity spectrum stacking (VSS) technique from reflection seismology to stack data with different ray parameters and improve the SNR. The VSS technique exploits differences in the shapes of the moveout curves of converted phases and reverberations to separate phases and infer velocity structure. By applying conventional receiver function techniques to the IRIS/IDA seismographic station at Obninsk, Russia, we infer a 2 km thick slow velocity surface layer and a 47 km depth to Moho with relatively uncomplicated crustal structure. By comparing VSS computed for OBN and Arti (ARU), Russia with PREM synthetics we have identified Ps phases from the 400 and 670 km discontinuities. We find mantle structure characterized by higher S velocities and deeper discontinuities than PREM. We find no evidence of a 210 km discontinuity beneath either station. VSS comparisons between OBN and ARU imply that the 670 km discontinuity is about 2 km shallower beneath ARU than OBN. DTIC

(Contract DE-AC09-89SR-18035)
(DE93-016269; WSRC-MS-93-361; CONF-9310102-1) Avail: CASI HC A03/MF A01

Geomorphic analyses combined with mapping of fluvial terraces and upland geomorphic surfaces provide new approaches and data for evaluating the Quaternary activity of post-Cretaceous faults that are recognized in subsurface data at the Savannah River Site in the Upper Coastal Plain of southwestern South Carolina. Analyses of longitudinal stream and terrace profiles, regional slope maps, and drainage basin morphometry indicate long-term uplift and southeast tilt of the site region. Preliminary results of drainage basin characterization suggests an apparent rejuvenation of drainages along the trace of the Pen Branch fault (a Tertiary reactivated reverse fault that initiated as a basin-margin normal fault along the northern boundary of the Triassic Dunbarton Basin). This apparent rejuvenation of drainages may be the result of nontectonic geomorphic processes or local tectonic uplift and tilting within a framework of regional uplift. DOE

[RESEARCH ON EARTH'S ROTATION AND THE EFFECT OF ATMOSPHERIC PRESSURE ON VERTICAL DEFORMATION AND SEA LEVEL VARIABILITY] Final Report
John Wahr 18 Mar. 1993 4 p
(Grant NAG5-485)
(NASA-CR-194300; NAS 1.26:194300) Avail: CASI HC A01/MF A01

The work done under NASA grant NAG5-485 included modelling the deformation of the earth caused by variations in atmospheric pressure. The amount of deformation near coasts is sensitive to the nature of the oceanic response to the pressure. The PSMSL (Permanent Service for Mean Sea Level) data suggest the response is inverted barometer at periods greater than a couple months. Green's functions were constructed to describe the perturbation of the geoid caused by atmospheric and oceanic loading and by the accompanying load-induced deformation. It was found that perturbation of up to 2 cm are possible. Ice mass balance data was used for continental glaciers to look at the glacial contributions to time-dependent changes in polar motion, the lod, the earth's gravitational field, the position of the earth's center-of-mass, and global sea level. It was found that there can be lateral, non-hydrostatic structure inside the fluid core caused by gravitational forcing from the mantle, from the inner core, or from topography at the core/mantle or inner core/outer core boundaries. The nutational and tidal response of a non-hydrostatic earth with a solid inner core was modeled. Monthly, global tide gauge data from PSMSL was used to look at the 18.6-year ocean tide, the 14-month pole tide, the oceanic response to pressure, the linear trend and inter-annual variability in the earth's gravity field, the global sea level rise, and the effects of post glacial rebound. The effects of mantle anelasticity on nutations, earth tides, and tidal variation in the lod was modeled. Results of this model can be used with Crustal Dynamics observations to look at the anelastic dissipation and dispersion at tidal periods. The effects of surface topography on various components of crustal deformation was also modeled, and numerical models were developed of post glacial rebound. Derived from text

CONTRIBUTIONS FROM GEOMAGNETIC INVERSE THEORY TO THE STUDY OF HYDROMAGNETIC CONDITIONS NEAR THE CORE-MANTLE BOUNDARY Final Report
George E. Backus 18 Nov. 1991 4 p
(Grant NAG5-818)
(NASA-CR-194303; NAS 1.26:194303) Avail: CASI HC A01/MF A01

The Final Report on contributions from geomagnetic inverse theory to the study of hydromagnetic conditions near the core-mantle boundary (CMB) is presented. The original proposal was to study five questions concerning what the surface and satellite magnetic data imply about hydromagnetic and electromagnetic conditions near the CMB. The five questions are: (1) what do the surface and satellite data imply about the geomagnetic field B near the surface of the earth; (2) how does one extrapolate B down through the conducting mantle to the CMB; (3) if B on the CMB is visible, how accurately does it satisfy the frozen-flux approximation; (4) if frozen flux is a good approximation on the CMB, what can be inferred about the fluid velocity v in the upper core; and (5) if v at the CMB is visible, does it suggest any dynamical properties of the core, such as vertical advection, Alfven-inertial waves, link instabilities, or mantle effects. A summary of the research is provided. Derived from text

SURFACE WAVE GROUP VELOCITY TOMOGRAPHY OF EAST ASIA, PART 1 Final Report, 1 Feb. 1992 - 1 Feb. 1993
Francis T. Wu 25 Jul. 1993 48 p
(Contract F19628-90-K-0042)
(AD-A270100; PL-TR-93-2102-Pt-1; AD-E201598) Avail: CASI HC A03/MF A01

Group velocities of both Rayleigh and Love waves are used in a tomographic inversion to obtain group velocity maps of East Asia (60 deg E-140 deg E and 20 deg N-50 deg N). The period range studied is 30-70 seconds. For periods longer than 40 seconds, a high group velocity gradient clearly exists along longitude 105 deg E; the velocities are noticeably higher east of this longitude than west of this longitude. The Tibetan Plateau appears as a prominent low velocity (about 15%) structure in this area; central Tibet appears as the area with the lowest velocity. The North China Plain is an area of high velocities, probably as a result of thin crust. The variability of deep crustal and upper mantle structures underneath the different tectonic provinces in the study can clearly be seen. In a separate study, using the dataset above and that from the former Soviet Union, we have derived the Rayleigh tomographic images of a larger area (40 deg E-160 deg E and 20 deg N-70 deg N). While the Tibetan plateau still remains to be the most prominent low velocity features, two other features are also clear, a very high velocity Siberian platform and a high velocity ridge extending from Lake Baikal to Central Mongolia. These studies are useful in delineating tectonics. DTIC

ANALYSIS OF REGIONAL BODYWAVE PHASES FROM EARTHQUAKES IN WESTERN CHINA, PART 2 Final Report, 1 Aug. 1991 - 1 Feb. 1993
Jeffrey S. Barker 17 Jun. 1993 54 p
(Contract F19628-90-K-0042)
(AD-A270125; PL-TR-93-2102-Pt-2; AD-E201606) Avail: CASI HC A04/MF A01

Broadband regional bodywave data have been collected and modeled for three profiles of earthquakes recorded at CDSN station WMQ in western China. The first profile is from earthquakes located to the southwest, within the Tienshan and Tarim basin. The second is from earthquakes to the NNE across the Altai mountains and the western tip of Mongolia and into Siberia. The third profile is from earthquakes to the SSE, some near the Lop Nor test site, and others from the Altyn Tagh and Qaidam Basin. Plane-layered velocity structure models were determined for each profile, and synthetic seismograms were computed using a frequency-wavenumber integration technique. For each earthquake, an appropriate source mechanism is assumed, and synthetic seismograms are computed for source depths of 10, 20 and 30 km. The modeling demonstrates that regional P(sub n)-P(sub pg) wavetrains result from the interference of several phases. Since some of these depart the source upward and other depart downward, this interference is sensitive to source depth and source mechanism. Therefore, as long as accurate synthetic seismograms can be computed, modeling these phases can serve as a powerful discriminant of earthquakes and explosions. DTIC

PENETRATING RADIATION ENVIRONMENT AND EFFECTS STUDY Scientific Report No. 1
H. D. Voss, W. L. Imhof, J. Mobilia, and E. E. Gaines 15 Jun. 1993 82 p
(Contract F19628-90-C-0103)
(AD-A270126; PL-TR-93-2147; AD-E201608) Avail: CASI HC A05/MF A01

This report summarizes some of the PREE achievements to date on data acquired from the Lockheed IMS-HI and SEP instruments on the CRRES satellite. The primary objectives of the PREE research are to: (1) inter-calibrate the ONR 307 instruments; (2) develop algorithms and software for understanding and modeling the radiation belts; (3) develop key parameters; and, (4) study the dynamic radiation belt variations in the slot region and the outer belt. The new IMS-HI instrument performed well during the CRRES mission and has been inter-calibrated with the IMS-LO, SEP and EPAS instruments. Much progress has been made in the development of key algorithms and software for mapping the electron, ion, and neutral flux. Energetic neutrals from the ring current have been observed directly and are an important low altitude and low latitude ionization source. Surveys of the medium energy (20-1000 keV) ion and neutral database indicate a sharp edge to the ring current flux which is not apparent in previous studies. The neutral flux is linked strongly with the low altitude edge of the ring current. To properly map the radiation belts and select key parameters a simple physical model was developed for the response of the magnetosphere to magnetic storms. The CRRES data indicate that the radiation belts including the inner belt are strongly modified during a sudden commencement (SC) on the order of several minutes. This momentary compression results in a net acceleration and transport of particles to low L in violation of the third invariant. For the 24 March 1991 magnetic storm the magnetopause is inferred to have penetrated to L approximately 3.0 resulting in the possible establishment of the 'new inner belt'. DTIC

GEOTHERMAL ACTIVITY NEAR CLEARLAKE, CALIFORNIA
K. L. Burns and R. M. Potter 1993 8 p Presented at the Annual Meeting of the Geothermal Resources Council, San Francisco, CA, 10-13 Oct. 1993
(Contract W-7405-eng-36)
(DE93-016627; LA-UR-93-2073; CONF-931042-2) Avail: CASI HC A02/MF A01

Geothermal activity in the region of high heat flow near the city of Clearlake includes hot springs, fumeroles, vents, and areas of hydrothermal alteration. Onshore, the location is controlled by Quaternary longitudinal NNW-trending faults of the San Andreas systems, and the transverse Burns Valley fault. Offshore, an additional control is arcuate graben-forming faults. The city is bracketed by three hydrothermal 'hot spots,' which are Sulphur Bank hot spring, resurgences in Burns Valley, and the Oak Cove hot spot. All three are associated with sharp 'spikes' in the isotherms and locally enhanced heat flow. DOE

SHOCK PROPAGATION IN CRUSTAL ROCK Annual Report, 1 Jul. 1992 - 30 Jun. 1993
William W. Anderson and Thomas J. Ahrens 8 Sep. 1993 9 p
(Contract F49620-92-J-0402)
(AD-A270148; CIT-64649; AFOSR-93-0741TR) Avail: CASI HC A02/MF A01

The shock Hugoniot and adiabatic release curves of sedimentary rocks display a range of different behaviors that affect the decay of shock waves propagating away from a confined source. Many of the minerals making up sandstones, shales, and limestones undergo phase transitions when shocked to pressures of interest to studies of coupling of energy from explosive sources into far field seismic waves. Both sandstones and limestones have been observed to exhibit elastic precursors and multiple wave behavior at shock velocities up to 3.7 km/s and 5.7 km/s, respectively Ahrens and Gregson, 1964. Hysteresis in the shock-release paths of materials results in irreversible energy deposition, thus depriving the shock wave of energy required to drive its propagation and resulting in a more rapid decay and less efficient coupling to far field waves than expected from geometrical effects alone. Thus, data constraining this behavior in rocks are essential for determining the cavity volumes for various degrees of decoupling for different lithologies. The behavior of most sedimentary rocks during adiabatic release has not been experimentally investigated to a significant extent. Our objective was to obtain experimental data for shock and release behaviors of elastic and carbonate sedimentary rocks and use those data along with data from other sources, to develop a theoretical model of the hysteretic shock-release paths of these rocks. We use this model to constrain the energy deposited irreversibly in these rocks by the passage of shock and release waves. The release model we use is a modification of that used by Sekine et al. 1993, submitted for granite. DTIC

USING COMPUTERIZED TOMOGRAPHY TO DETERMINE IONOSPHERIC STRUCTURES
C. N. Vittitoe Aug. 1993 41 p

(Contract DE-AC04-76DP-00789)
(DE93-018904; SAND-93-1389) Avail: CASI HC A03/MF A01

A method is presented to unfold the two-dimensional vertical structure in electron density by using data on the total electron content for a series of paths through the ionosphere. The method uses a set of orthonormal basis functions to represent the vertical structure and takes advantage of curved paths and the eikonical equation to reduce the number of iterations required for a solution. Curved paths allow a more thorough probing of the ionosphere with a given set of transmitter and receiver positions. The approach can be directly extended to more complex geometries. DOE

THE EFFECTS OF MAGNETIC STORM PHASES ON F-LAYER IRREGULARITIES FROM AURORAL TO EQUATORIAL LATITUDES Quarterly Report, 1 Apr. - 30 Jun. 1993
Jules Aarons and Michael Mendillo 30 Jun. 1993 2 p
(Contract N00014-89-J-1754)
(AD-A267388) Avail: CASI HC A01/MF A01

We continued with the comparison of scintillation and total electron content (TEC) data from a chain of stations in the Pacific. The study compares TEC and scintillation data for the following station locations: Manila, the Philippines; Palehua, Hawaii; Lunping, Taiwan; and Osan, Korea. Three of the stations, Manila, Lunping, and Osan, are spaced along a narrow range of longitudes. For some periods in 1980 and 1981, all the data are available. The data set for June and July 1980 and 1981 have been reduced and are being studied. The data present many problems. It was assumed than an equatorial plume extending well over 1500 km in altitude would be effective in the anomaly region 15 to 20 deg from the equator. What is puzzling is that there are effects (scintillations and fluctuations in Faraday rotation) that appear over several hours with no activity reported from the site near the magnetic equator (Manila). This might be due to the high electron content in the Osan region plus the sensitivity of its propagation angle. Further studies are needed to resolve this issue. DTIC

GROUND MOVEMENTS ASSOCIATED WITH GAS HYDRATE PRODUCTION
H. J. Siriwardane 1992 17 p
(Contract DE-FG21-91MC-28080)
(DE93-019887; DOE/MC-28080/3381) Avail: CASI HC A03/MF A01

The grantee will evaluate the influence of hydrate production on ground subsidence near the wellbore and the surface. The objective of this research will be achieved by using computer simulations of what is expected in a hydrate reservoir during the production stage as reported by hydrate production models and available data. The model will be based on theories of continuum mechanics, thermomechanics of hydrate production, principles of rock mechanics and geomechanics, and special features of geomaterials under cold temperatures such as those found in permafrost regions. The research work involved in the proposed investigation will be divided into three major tasks: (1) Mechanics of subsidence in permafrost regions; (2) modeling of subsidence; and (3) parametric studies. Progress reports are presented for tasks 1 and 2. DOE

INVERSE SCATTERING OF SURFACE WAVES: A NEW LOOK AT SURFACE CONSISTENCY
Bastian Blonk and Gerard C. Herman 1993 35 p Presented at the 62nd Annual SEG Meeting, New Orleans, LA, Oct. 1992 Sponsored in part by Netherlands Technology Foundation, and Shell Research
(Rept-93-25; ETN-93-94652) Copyright Avail: CASI HC A03/MF A01

A method for removing near surface scattered noise from seismic data is presented. Starting from an appropriately chosen background model, a surface consistent impedance scattering model is determined using linearized elastodynamic inverse scattering theory. This scattering model does not necessarily equal the actual scatterer distribution, but it enables the near surface scattered part of the data to be approximately calculated. The method honors at least some of the complexity of the near surface scattering process and can be applied in cases where traditional methods, like wavenumber frequency filtering techniques and methods for static corrections, are ineffective. From a number of tests on synthetic data, it is concluded that the method is rather robust; its main sensitivity is due to errors in the determination of the background Rayleigh wave velocity. ESA

ANALYSIS OF SATELLITE-DERIVED OZONE AND WATER VAPOR MEASUREMENTS Final Report, 15 Jul. 1988 - 30 Sep. 1992
John L. Stanford 30 Sep. 1992 2 p
(Grant NAG5-1060)
(NASA-CR-193810; NAS 1.26:193810) Avail: CASI HC A01/MF A01

Research under this grant has involved analyses of satellite-derived measurements of water vapor and total ozone. Upper tropospheric water vapor data from the Nimbus 7 temperature-humidity infrared radiometer (THIR) 6.7 micron channel were analyzed by Fourier transformation to provide wavenumber spectra for a case of an upper level system over Europe. The power law spectrum for horizontal scales from 60 to several hundred km suggests that when convective cloud energy sources are not present, the enstrophy-cascading process (with variance proportional to the minus three power of wavenumber) may hold to much smaller scales than previously thought. Several investigations of the middle atmosphere (stratosphere and mesosphere) were also conducted. Slow atmospheric oscillations with periods of 1-2 months were investigated in total ozone measurements and in ionospheric data. Using one-point correlation maps and total ozone mapping spectrometer (TOMS) data, strong statistical evidence was found for the planetary-scale oscillations at these periods. A dipole-like pattern in the tropical equatorial Indian ocean-western Pacific region was documented, along with wavetrain-like patterns emanating into the extratropics. While attempting to follow the oscillations upward above stratosphere, oscillations were studied in ionospheric data (D-region radio wave absorption, in the upper mesosphere, around 80-90 km altitude). Cross-spectral analyses with solar flux data revealed that much of the observed 1-2 month variance in the ionospheric D-region was well correlated to solar variations. Further research has involved investigations of the photochemical lifetime of greenhouse gases methane and nitrous oxide. Using Nimbus 7 satellite data, a new analysis technique was employed to determine the lifetime of these gases in situ in the upper stratosphere. The lifetimes are found to be in good agreement with theoretical estimates. Author (revised)

A PHYSICAL MODEL FOR ONE-DIMENSION AND TIME-DEPENDENT IONOSPHERE. PART 1: DESCRIPTION OF THE MODEL
Shun-Rong Zhang, S. M. Radicella, Xin-Yu Huang, and Yuan-Zhi Su Mar. 1993 10 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-627958; IC-93/45-Pt-1) Avail: CASI HC A02 (US Sales Only)

On the basis of continuity and momentum equations for the ionospheric F region, a time-dependent and one-dimension model for O(sup +), N2(sup +), O2(sup +), and NO(sup +), taking into account photoionization production, 10 recombination reactions, thermospheric wind and electromagnetic drifts, have been derived. The bottom side boundary is set to be dominated by photo-chemical reactions, meanwhile, the top side can be influenced by other processes. Electron density, especially foF(sub 2), or flux can be given as input. The present model can be used for the investigation of the influence of different parameters on the ionospheric processes, such as neutral wind, solar radiation flux, electromagnetic forces, and others. Part 1 gives the description of the model. Numerical results and its physical discussions will be addressed in the next paper. DOE

NUMERICAL ANALYSIS OF PRESSURE METER TESTS: APPLICATION OF PARAMETER IDENTIFICATION OF SOILS BEHAVIOR Ph.D. Thesis [ANALYSE NUMERIQUE DE L'ESSAI PRESSIOMETRIQUE: APPLICATION A L'IDENTIFICATION DE PARAMETRES DE COMPORTEMENT DES SOLS]
Ramdane Bahar 1992 222 p In FRENCH
(ECL-92-52; ETN-93-94893) Avail: CASI HC A10/MF A03

The results of pressure meter tests to define constants of constitutive models for soils using nonviscous models and viscous models are analyzed. An equation defining the problem of the expansion of the pressure meter probe considering the assumption of plane strain is presented. Phenomena for the identification procedure are numerically analyzed using the nonviscous model. The model parameter identification procedure is presented using the results of pressure meter tests. To take into account the creep phenomena of soils, a nonlinear viscoelastic rheological model is proposed. This approach is used to identify the constants of the Pithiviers limestone of the site of Saint Laurent des Eaux and the pasty chalk of Nogent sur Seine (France). Two examples of the use of this procedure are presented and compared to forecasts and in situ measurements. ESA

A NEW APPROACH TO THE STUDY OF THE TURBULENCE LAYER Final Technical Report, 1 Oct. 1991 - 31 Oct. 1993
Ruth A. Levenson 18 Oct. 1993 4 p
(Contract NCC5-45)
(NASA-CR-194546; NAS 1.26:194546) Avail: CASI HC A01/MF A01

Turbulent thermal convection is of considerable importance in fluid dynamical transport phenomena occurring, for example, in the planetary boundary layer of the Earth, the interiors of stars, and accretion disks. In particular, during a significant portion of the evolutionary phase of many stars having convectively unstable cores or outer envelopes, a substantial fraction of energy is transported from the central layers to the outer layers by thermal convection. Moreover, as much of the interior of a star is in highly turbulent motion, a complete theory of stellar structure and evolution requires the explicit consideration of turbulence in order to have expressions for the turbulent quantities arising in the stellar structure equations, and particularly, the turbulent fluxes that appear in the total flux conservation equation, such as the convective flux, kinetic energy flux, etc. A reliable quantification of these fluxes continues to present a challenge in astrophysical fluid dynamics, primarily because astrophysical turbulence is almost always fully-developed and nearly inviscid, and therefore governed by strong nonlinear interactions that distribute the energy among a very wide spectrum of eddies with scales ranging from the characteristic dimension of the flow to those sufficiently small to be affected by viscous dissipation. Furthermore, astrophysical flows are invariably compressible, anisotropic, and inhomogeneous, which requires the consideration of the dynamics of longitudinal modes and their interaction with the transverse modes, as well as complicated boundary conditions. In order to reach a compromise between analytical and numerical tractability and the basic physics of turbulent convection, we have constructed a model of stationary turbulent convection that yields various turbulence statistics, including the convective flux, that are required in stellar evolution models. A new approach to the understanding of crustal deformation was developed under this grant. This approach combined aspects of fractals, chaos, and self-organized criticality to provide a comprehensive theory for deformation on distributed faults. It is hypothesized that crustal deformation is an example of comminution: Deformation takes place on a fractal distribution of faults resulting in a fractal distribution of seismicity. Our primary effort under this grant was devoted to developing an understanding of distributed deformation in the continental crust. An initial effort was carried out on the fractal clustering of earthquakes in time. It was shown that earthquakes do not obey random Poisson statistics, but can be approximated in many cases by coupled, scale-invariant fractal statistics. We applied our approach to the statistics of earthquakes in the New Hebrides region of the southwest Pacific because of the very high level of seismicity there. This work was written up and published in the Bulletin of the Seismological Society of America. This approach was also applied to the statistics of the seismicity on the San Andreas fault system. THE INTERPRETATION OF CRUSTAL DYNAMICS DATA IN TERMS OF PLATE MOTIONS AND REGIONAL DEFORMATION NEAR PLATE BOUNDARIES Final Technical Report, 22 Sep. 1986 - 31 Dec. 1991
Sean C. Solomon 1991 9 p
(Grant NAG5-814)
(NASA-CR-194302; NAS 1.26:194302) Avail: CASI HC A02/MF A01

During our participation in the NASA Crustal Dynamics Project under NASA contract NAS-27339 and grant NAG5-814 for the period 1982-1991, we published or submitted for publication 30 research papers and 52 abstracts of presentations at scientific meetings. In addition, five M.I.T. Ph.D. students (Eric Bergman, Steven Bratt, Dan Davis, Jeanne Sauber, Anne Sheehan) were supported wholly or in part by this project during their thesis research. Highlights of our research progress during this period include the following: application of geodetic data to determine rates of strain in the Mojave block and in central California and to clarify the relation of such strain to the San Andreas fault and Pacific-North American plate motions; application of geodetic data to infer post seismic deformation associated with large earthquakes in the Imperial Valley, Hebgen Lake, Argentina, and Chile; determination of the state of stress in oceanic lithosphere from a systematic study of the centroid depths and source mechanisms of oceanic intraplate earthquakes; development of models for the state of stress in young oceanic regions arising from the differential cooling of the lithosphere; determination of the depth extent and rupture characteristics of oceanic transform earthquakes; improved determination of earthquake slip vectors in the Gulf of California, an important data set for the estimation of Pacific-North American plate motions; development of models for the state of stress and mechanics of fold-and-thrust belts and accretionary wedges; development of procedures to invert geoid height, residual bathymetry, and differential body wave travel time residuals for lateral variations in the characteristic temperature and bulk composition of the oceanic upper mantle; and initial GPS measurements of crustal deformation associated with the Imperial-Cerro Prieto fault system in southern California and northern Mexico. Full descriptions of the research conducted on these topics may be found in the Semi-Annual status Reports submitted regularly to NASA over the course of this project and in the publications listed. SURFACE FLUXES IMPORTANT TO CLOUD DEVELOPMENT
F. J. Barnes, W. Porch, and K. E. Kunkel (Illinois State Water Survey, Champaign.) 1993 5 p Presented at the 3rd ARM Science Team Meeting, Norman, OK, 1-5 Mar. 1993
(Contract W-7405-eng-36)
(DE93-016633; LA-UR-93-1990; CONF-9303122-4) Avail: CASI HC A01/MF A01

To address some of the issues in scaling and averaging of measurements, collaborative field campaigns were conducted in June 1991 and 1992 by the DOE laboratories funded under the ARM program. We selected a site in Boardman, OR, with two distinct regions where the sensible and latent heat fluxes would differ sharply and where each region was sufficiently extensive for full development of boundary layers and for utilizing aircraft-mounted instrument systems. Measurements were clustered along a 16-km transect across adjoining irrigated farmland and semi-arid rangeland regions that allowed the collaborating teams to conduct a variety of studies relating to overall goals. The Los Alamos team efforts were focused on assessing the effects of different surface characteristics on fluxes of heat and water vapor. DOE

A TECHNIQUE FOR MEASURING WINDS IN THE LOWER ATMOSPHERE USING INCOHERENT DOPPLER LIDAR
D. H. DeSlover, D. R. Slaughter, W. M. Tulloch, and W. E. White 14 Apr. 1993 7 p Presented at the Optical Society of America Meeting on Optical Remote Sensing of the Atmosphere, Salt Lake City, UT, 8-12 Mar. 1993
(Contract W-7405-eng-48)
(DE93-017163; UCRL-JC-113310; CONF-930346-3) Avail: CASI HC A02/MF A01

Wind speed is useful from a meteorological standpoint, in atmospheric modeling, and assessment of trace gas dispersal. A continuing effort is involved in improving the sensitivity of such measurements, and is exemplified by the literature. The Mobile Atmospheric Research Laboratory (MARL) at Lawrence Livermore National Laboratory (LLNL) is currently developing a method to improve the sensitivity of wind sounding in the lower through middle atmosphere using a pair of Fabry-Perot interferometers in parallel. This technique, first described by Chanin, for the middle atmosphere using Doppler Rayleigh lidar, can be applied to the lower atmosphere where Mie (aerosol) backscatter is strong. Elastic events, inherent in both Rayleigh and Mie backscatter, dominate the return signal throughout the atmosphere. Both are susceptible to local wind vectors; which will Doppler shift the laser frequency proportional to the wind velocity. A pair of Fabry-Perot interferometers, tuned to either side of the laser frequency, will provide necessary data to determine the shift in frequency of the backscattered signal. Spectral drift and jitter of the laser and a lack of data points to determine the wind vector place limits on the sensitivity of the system. A method to minimize each of these is presented. DOE

A REVIEW OF WIND FIELD MODELS FOR ATMOSPHERIC TRANSPORT
J. V. Ramsdell, Jr. and E. D. Skyllingstad Jun. 1993 56 p
(Contract DE-AC06-76RL-01830)
(DE93-016085; PNWD-2148-HEDR) Avail: CASI HC A04/MF A01

The primary objective of the Hanford Environmental Dose Reconstruction (HEDR) Project is to estimate the radiation dose that individuals could have received as a result of emissions since 1944 from the US Department of Energy's (DOE) Hanford Site near Richland, Washington. The HEDR Project is developing a computer code to estimate these doses and their uncertainties. The code, known as the HEDR Integrated Code (HEDRIC), consists of four separate component codes. One of the component codes, called the Regional Atmospheric Transport Code for Hanford Emission Tracking (RATCHET), combines meteorological and release data to estimate time-integrated air concentrations and surface contamination at specific locations in the vicinity of the Hanford Site. The RATCHET domain covers approximately 75,000 square miles, extending from the crest of the Cascade Mountains on the west to the eastern edge of the Idaho panhandle and from central Oregon on the south to the Canadian border. This letter report explains the procedures in RATCHET that transform observed wind data into the wind fields used in atmospheric transport calculations. It also describes and evaluates alternative procedures not selected for use in RATCHET. DOE

VERIFICATION OF 3I RETRIEVALS VIS-A-VIS RADIOSONDE OBSERVATIONS
G. J. Prangsma 1993 39 p
(KNMI-TR-150; ISBN-90-369-2031-0; ETN-93-94535) Copyright Avail: Royal Netherlands Meteorological Institute, P.O. Box 201, 3730 AE De Bilt, Wilhelminalaan 10, Netherlands

A set of Tiros Operational Vertical Sounder (TOVS) observations from 58 NOAA-11 orbits in the period 14 Sep. to 3 Oct. 1992 over Europe were processed with the 3I system. The resulting retrievals were compared with collocated radiosondes extracted from the operational database for the same period. The collocation criteria (less than 3 hours time difference and a maximum distance of 50 km) resulted in a statistical dataset with about 100 or more items in each of the considered sub cases: clear-cloudy, day-night, and their combinations. Apart from results for the layer mean virtual temperatures, statistics for the stability index and for the total water vapor content were obtained. Error correlation matrices for the thickness errors in the various layers were computed. ESA

MIXTURE DISTRIBUTIONS IN CLIMATOLOGICAL RESEARCH
S. L. Grotch Dec. 1992 8 p Presented at the 17th Annual Climate Diagnostics Conference, Norman, OK, 19-23 Oct. 1992
(Contract W-7405-eng-48)
(DE93-014125; UCRL-JC-111263; CONF-9210334-3) Avail: CASI HC A02/MF A01

Mixture distributions have had a long history in statistics where the central problem has been the decomposition of multiple distributions into their component parts and the estimation of the parameters of these sub-distributions. Here, in the climatological context however, the nature of these complex distributions is examined, without any attempt to decompose them, examining not only data distributions for a range of climatological variables, but their anomaly distributions as well. Histograms are easily generated, providing a rich visual display for intercomparison purposes. They serve to readily flag suspect or unusual data and can be suggestive of underlying mechanism. They can provide information which can be of considerable value for extreme value studies. Finally, an enormously rich statistical literature exists on the nature of distributions, physical processes leading to their development, and techniques for parameter estimation. Of particular relevance to model/data intercomparisons, there exist a broad range of tools for addressing the fundamental question: 'are two distributions statistically the same?'. DOE

DEFINING THE NORMAL TURBINE INFLOW WITHIN A WIND PARK ENVIRONMENT

N. D. Kelley Jun. 1993 12 p Presented at the IEA Expert Meeting 24: Wind Conditions for Wind Turbine Design, Roskilde, Denmark, 29-30 Apr. 1993
(Contract DE-AC02-83CH-10093)
(DE93-010032; NREL/TP-442-5619; CONF-9304177-1) Avail: CASI HC A03/MF A01

This brief paper discusses factors that must be considered when defining the 'normal' (as opposed to 'extreme') loading conditions seen in wind turbines operating within a wind park environment. The author defines the 'normal' conditions to include fatigue damage accumulation as a result of: (1) start/stop cycles, (2) emergency shutdowns, and (3) the turbulence environment associated with site and turbine location. He also interprets 'extreme' loading conditions to include those events that can challenge the survivability of the turbine. DOE

BOUNDARY LAYER HEAT BUDGETS FROM WIND PROFILER/RASS DATA: A FEASIBILITY STUDY

M. Furger and C. D. Whiteman Mar. 1993 4 p Presented at the 3rd ARM Science Team Meeting, Norman, OK, 1-5 Mar. 1993
(Contract DE-AC06-76RL-01830)
(DE93-013187; PNL-SA-21918; CONF-9303122-3) Avail: CASI HC A01/MF A01

Radar wind profilers (WP) and radio-acoustic sounding systems (RASS) are now available commercially and offer the promise of improving our knowledge of processes in the lower atmosphere on scales that were until now unresolved spatially and/or temporally. Plans to install a network of boundary layer WP/RASSes are now under discussion in the US Department of Energy's ARM (Atmospheric Radiation Measurement) program and in other national programs and may be realized within two or three years. The new devices raise the prospect of gaining better insight into planetary boundary layer processes. With this background in mind we re-evaluate some classical methods for the calculation of kinematic and dynamic quantities using measurements from these new remote sensing devices. DOE

EFFECT OF SPATIAL RESOLUTION ON THE SIMULATION OF REGIONAL PRECIPITATION IN CHINA IN A GLOBAL CLIMATE MODEL

G. L. Potter, K. R. Sperber, J. S. Boyle, and S. Hameed Sep. 1992 5 p Presented at the 73rd American Meteorological Society Meeting, Anaheim, CA, 17-22 Jan. 1992
(Contracts W-7405-eng-48; DE-FG02-85ER-60314)
(DE93-013433; UCRL-JC-111835; CONF-9201148-2) Avail: CASI HC A01/MF A01

In order to evaluate the consequences of climate change for agriculture and the economy we need to develop climate models capable of correctly simulating regional precipitation patterns. The deficiency of global climate models in the simulation of orographic precipitation may be related to the crudeness of model topography. Inadequacies in the parameterizations of physical processes cause additional errors in the calculation of orographic as well as frontal precipitation. In this study, we have investigated the role of model resolution in simulating the geographical distribution of precipitation over China. Comparisons are made between observations and the calculated precipitation fields in a seasonal run with climatological sea surface temperatures. This study describes results for June and July from 12 month simulations of the ECMWF model at the following four resolutions: T21 (5(times)5 degree), T42 (3(times)3 degree), T63 (2(times)2 degree) and T106 (1(times)1 degree). A description of this model is given by Simmons et. al. (1988). The various resolutions of the ECMWF model are virtually identical with the exception of the gravity wave drag (Palmer et al. 1986), vertical diffusion coefficients and orography. The T21 resolution lacks gravity wave drag completely. DOE

ANALYSIS OF METEOROLOGICAL CONDITIONS DURING AGASP-4: 30 MARCH - 23 APRIL 1992

G. A. Herbert, P. J. Sheridan (Colorado Univ., Boulder.), R. C. Schnell, M. Z. Bieniulis (Colorado Univ., Boulder.), and B. A. Bodhaine Apr. 1993 123 p See also PB88-164140
(PB93-190205; NOAA-TM-ERL-CMDL-5) Avail: CASI HC A06/MF A02

The fourth Arctic Gas and Aerosol Sampling Program (AGASP-IV) was conducted over Alaska and the Beaufort Sea during March and April 1992. The NOAA WP-3D aircraft made nine flights. On the first eight flights special aerosol and gas sampling instrumentation was installed, and extensive time was spent over the pack ice. Measurements of wind, pressure, temperature, relative humidity, ozone, and condensation nucleus (CN) concentration were used to identify the air mass type, recent origin, and existence of pollution-derived aerosols, i.e., haze. While small patches of elevated CN concentrations and higher aerosol scattering coefficients were observed, significantly large regions, of the type found in previous AGASP missions, were not observed during the series. On most flights the CN concentrations in the troposphere were representative of 'clean' background conditions at this latitude. Significant concentrations of CN (CN greater than 7000/cm(exp 3)) found above the tropopause on three flights indicated the presence of volcanic aerosol probably from the Pinatubo volcanic plume at high latitudes. In four instances low ozone concentrations suggest the destruction of ozone in the surface layer. NTIS

A MOBILE REMOTE SENSING LABORATORY FOR WATER VAPOR, TRACE GAS, AEROSOL, AND WIND SPEED MEASUREMENTS

D. Slaughter, W. White, W. Tulloch, and D. DeSlover 19 Mar. 1993 7 p Presented at the Optical Society of America Meeting on Optical Remote Sensing of the Atmosphere, Salt Lake City, UT, 8-12 Mar. 1993
(Contract W-7405-eng-48)
(DE93-017158; UCRL-JC-113269; CONF-930346-2) Avail: CASI HC A02/MF A01

The Lawrence Livermore National Laboratory has developed a mobile field laboratory for remote measurement of atmospheric processes and observables that are important in global climate change, dispersal of hazardous materials, and atmospheric pollution. Specific observables of interest are water vapor, trace gases, aerosol size and density, wind, and temperature. The goal is to study atmospheric processes continuously for extended periods in remote field locations. This laboratory has just reached field ready status with sensors for aerosol and trace gas measurement based on established techniques. A development program is underway to enhance the sensor suite with several new techniques and instruments that are expected to significantly extend the state of the art in remote trace gas analysis. The new sensors will be incorporated into the lab during the next two years. DOE

A regional atmospheric climate model which combines the physical parametrization package of a general circulation or climate model (ECHAM) and the dynamics package of the Nordic/Dutch/Irish High Resolution Limited Area Model (HIRLAM) was developed. The objectives of the project are formulated, and the developing strategy is described in some detail mainly as a guidance for the potential user with a limited knowledge of either of the two models. Furthermore, the necessary changes applied to both model packages in order to obtain a working code are described. Preliminary results of the very first experiments are presented and discussed. ESA

SPECTRAL ANALYSIS OF SYNOPTIC TIME SCALE DISTURBANCES OVER THE TROPICAL EASTERN PACIFIC DURING SUMMER 1989, 1990 AND 1991 M.S. Thesis
William C. Swett 25 Mar. 1993 93 p
(AD-A268821) Avail: CASI HC A05/MF A01

In this study we used data analyzed by the Navy Operational Global Analysis and Prediction System (NOGAPS) to study the 4-10 day disturbances over the eastern tropical Pacific. The period of study is May - Sep. of 1989, 1990 and 1991. Spectral and cross-spectral analyses were used to determine the structure of the disturbances. The results show zonal wavelengths of 3000 to 8000 kilometers and a tendency for northeast-southwest tilt in the meridional direction. The most active year appears to be 1991, with the highest relative variance in the 4-10 day window and the highest coherence between parameters. The vertical tilt was found to be westward with height above 300-400 hpa in 1989 and above 200 hpa in 1990 and 1991. This interannual variation was consistent with the change in vertical shear of the mean zonal wind. Below 400 hpa in 1989 and 200 hpa in 1990 and 1991, the vertical tilt was eastward with height. The thermal structure was consistent with the hydrostatic relationship in all three years. The waves transport heat poleward above 200 hpa and equatorward below 200 hpa. DTIC

THREE-DIMENSIONAL CLOUD VISUALIZATION BASED ON SATELLITE IMAGERY M.S. Thesis
Kevin L. Stone Dec. 1992 73 p
(AD-A269318) Avail: CASI HC A04/MF A01

This thesis presents three dimensional visualizations of cloud scenes created with scientific visualization software implemented on high-performance graphics workstations. Cloud scenes are constructed for four separate cases, consisting of low stratus clouds off the California coast, stratus over the Great Plains, convective cumulus over the Gulf Coast region and Hurricane Andrew as it crossed southern Florida. The user interacts with the cloud scenes, on the computer screen, allowing the clouds to be studied from different perspectives. Procedures have been modified to integrate satellite information with sounding data to construct cloud tops. Techniques have been developed to integrate gridded surface observations with topography data to construct cloud bases with varying heights. Cloud bases determined in this manner are a more realistic representation than previous methods of using a constant height for all cloud bases in the cloud scene. DTIC

INTERNAL INSTABILITY OF NONPARALLEL FLOW ON AN EQUATORIAL BETA-PLANE Annual Report, 15 May 1992 - 14 May 1993
Timothy J. Dunkerton 14 Jun. 1993 54 p
(Contract F49620-92-C-0033)
(AD-A268927; NWRA-CR-93-R103; AFOSR-93-0670TR) Avail: CASI HC A04/MF A01

A simple theoretical model was developed to investigate the inertial instability of zonally nonuniform, nonparallel flow near the equator. The basic state was independent of height and time but included cross-equatorial shear with longitudinal variation, as observed in the tropical mesosphere and elsewhere. Numerical solutions were obtained for the most unstable modes. It is shown that, in addition to previously known 'global' (symmetric and nonsymmetric) modes of inertial instability, there exist 'local' modes within regions of anomalous potential vorticity. The local mode has properties similar to those of 'absolute' instability of nonparallel flow as discussed elsewhere in fluid dynamics. DTIC

NEW TECHNIQUES FOR CONTRAIL FORECASTING Technical Report
Jeffrey L. Peters Aug. 1993 37 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A269686; AWS/TR-93/001) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

This report documents the results of a study requested by the Strategic Air Command Deputy Chief of Staff for Operations (SAC/DO) to update previous contrail forecasting research done by Herbert Appleman for HQ Air Weather Service in 1953. Advancements in aircraft power plants, especially the development of bypass turbofan engines, made the new study necessary. This attempt to update and improve current contrail forecasting methods was performed by the SAC Directorate of Weather (SAC/DOW). It describes the development of new contrail forecast algorithms for several types of engines used in high-flying aircraft. It also provides contrail forecasting rules that correlate synoptic-scale upward vertical motion with contrail formation. The results indicate significant improvement in contrail forecasting accuracy over the Appleman technique now in use at the Air Force Global Weather Central. DTIC

SOME POTENTIAL ERRORS IN SATELLITE WIND ESTIMATES USING THE GEOSTROPHIC APPROXIMATION AND THE THERMAL WIND Final Report

James Cogan Jun. 1993 35 p
(AD-A269784; ARL-MR-36) Avail: CASI HC A03/MF A01

Current and planned passive sensors on meteorological satellites measure radiances that are converted directly into temperature and humidity soundings. In turn, wind velocity is derived from the temperature soundings and other derived variables (for example, geopotential heights). Current operational methods involve either the geostrophic wind or the thermal wind approximation. This report presents some information and sample calculations on the types of errors that may be expected when either approximation is used to estimate the actual wind from data gathered by passive satellite sensors. The assumption is that no additional data are available (that is, only satellite sounding data from sensors of the type found on present day environmental satellites). This report does not treat the improvements that should occur when data from other sources of data (for example, radar profilers, ground-based radiometers, unmanned aerial vehicles) are combined with the satellite data. MICROWAVE (SSM/I) ESTIMATES OF THE PRECIPITATION RATE TO IMPROVE NUMERICAL ATMOSPHERIC MODEL FORECASTS Final Report

William H. Raymond and William S. Olson 1990 189 p
(Grant NAGw-1855)
(NASA-CR-193566; NAS 1.26:193566) Avail: CASI HC A09/MF A02

Delay in the spin-up of precipitation early in numerical atmospheric forecasts is a deficiency correctable by diabatic initialization combined with diabatic forcing. For either to be effective requires some knowledge of the magnitude and vertical placement of the latent heating fields. Until recently the best source of cloud and rain water data was the remotely sensed vertical integrated precipitation rate or liquid water content. Vertical placement of the condensation remains unknown. Some information about the vertical distribution of the heating rates and precipitating liquid water and ice can be obtained from retrieval techniques that use a physical model of precipitating clouds to refine and improve the interpretation of the remotely sensed data. A description of this procedure and an examination of its 3-D liquid water products, along with improved modeling methods that enhance or speed-up storm development is discussed. For individual titles, see N94-18603 through N94-18608.

DIABATIC FORCING AND INITIALIZATION WITH ASSIMILATION OF CLOUD AND RAIN WATER IN A FORECAST MODEL: METHODOLOGY

William H. Raymond, William S. Olson, and Geary Callan (National Environmental Satellite Service, Madison, WI.) *In its* Microwave (SSM/I) Estimates of the Precipitation Rate to Improve Numerical Atmospheric Model Forecasts 1990 69 p Submitted for publication (For primary document see N94-18602 04-47)
(Grants NAGw-1855; NSF ATM-89-20508)
Avail: CASI HC A04/MF A02

The focus of this part of the investigation is to find one or more general modeling techniques that will help reduce the time taken by numerical forecast models to initiate or spin-up precipitation processes and enhance storm intensity. If the conventional data base could explain the atmospheric mesoscale flow in detail, then much of our problem would be eliminated. But the data base is primarily synoptic scale, requiring that a solution must be sought either in nonconventional data, in methods to initialize mesoscale circulations, or in ways of retaining between forecasts the model generated mesoscale dynamics and precipitation fields. All three methods are investigated. The initialization and assimilation of explicit cloud and rainwater quantities computed from conservation equations in a mesoscale regional model are examined. The physical processes include condensation, evaporation, autoconversion, accretion, and the removal of rainwater by fallout. The question of how to initialize the explicit liquid water calculations in numerical models and how to retain information about precipitation processes during the 4-D assimilation cycle are important issues that are addressed. The explicit cloud calculations were purposely kept simple so that different initialization techniques can be easily and economically tested. Precipitation spin-up processes associated with three different types of weather phenomena are examined. Our findings show that diabatic initialization, or diabatic initialization in combination with a new diabatic forcing procedure, work effectively to enhance the spin-up of precipitation in a mesoscale numerical weather prediction forecast. Also, the retention of cloud and rain water during the analysis phase of the 4-D data assimilation procedure is shown to be valuable. Without detailed observations, the vertical placement of the diabatic heating remains a critical problem. Author (revised)

PHYSICAL RETRIEVAL OF PRECIPITATION WATER CONTENTS FROM SPECIAL SENSOR MICROWAVE/IMAGER (SSM/I) DATA. PART 1: A CLOUD ENSEMBLE/RADIATIVE PARAMETERIZATION FOR SENSOR RESPONSE (REPORT VERSION)

William S. Olson and William H. Raymond *In its* Microwave (SSM/I) Estimates of the Precipitation Rate to Improve Numerical Atmospheric Model Forecasts 1990 34 p Submitted for publication (For primary document see N94-18602 04-47)
(Grants NAGw-1855; NSF ATM-89-20508)
Avail: CASI HC A03/MF A02

The physical retrieval of geophysical parameters based upon remotely sensed data requires a sensor response model which relates the upwelling radiances that the sensor observes to the parameters to be retrieved. In the retrieval of precipitation water contents from satellite passive microwave observations, the sensor response model has two basic components. First, a description of the radiative transfer of microwaves through a precipitating atmosphere must be considered, because it is necessary to establish the physical relationship between precipitation water content and upwelling microwave brightness temperature. Also the spatial response of the satellite microwave sensor (or antenna pattern) must be included in the description of sensor response, since precipitation and the associated brightness temperature field can vary over a typical microwave sensor resolution footprint. A 'population' of convective cells, as well as stratiform clouds, are simulated using a computationally-efficient multi-cylinder cloud model. Ensembles of clouds selected at random from the population, distributed over a 25 km x 25 km model domain, serve as the basis for radiative transfer calculations of upwelling brightness temperatures at the SSM/I frequencies. Sensor spatial response is treated explicitly by convolving the upwelling brightness temperature by the domain-integrated SSM/I antenna patterns. The sensor response model is utilized in precipitation water content retrievals. Author (revised)

PHYSICAL RETRIEVAL OF PRECIPITATION WATER CONTENTS FROM SPECIAL SENSOR MICROWAVE/IMAGER (SSM/I) DATA. PART 2: RETRIEVAL METHOD AND APPLICATIONS (REPORT VERSION)

William S. Olson *In its* Microwave (SSM/I) Estimates of the Precipitation Rate to Improve Numerical Atmospheric Model Forecasts 1990 24 p Submitted for publication (For primary document see N94-18602 04-47)
(Grant NAGw-1855)
Avail: CASI HC A03/MF A02

A physical retrieval method for estimating precipitating water distributions and other geophysical parameters based upon measurements from the DMSP-F8 SSM/I is developed. Three unique features of the retrieval method are (1) sensor antenna patterns are explicitly included to accommodate varying channel resolution; (2) precipitation-brightness temperature relationships are quantified using the cloud ensemble/radiative parameterization; and (3) spatial constraints are imposed for certain background parameters, such as humidity, which vary more slowly in the horizontal than the cloud and precipitation water contents. The general framework of the method will facilitate the incorporation of measurements from the SSMJT, SSM/T-2 and geostationary infrared measurements, as well as information from conventional sources (e.g., radiosondes) or numerical forecast model fields. FORECAST MODEL APPLICATIONS OF RETRIEVED THREE DIMENSIONAL LIQUID WATER FIELDS

William H. Raymond and William S. Olson *In its* Microwave (SSM/I) Estimates of the Precipitation Rate to Improve Numerical Atmospheric Model Forecasts 1990 28 p Submitted for publication (For primary document see N94-18602 04-47)
(Grants NAGw-1855; NSF ATM-89-20508)
Avail: CASI HC A03/MF A02

Forecasts are made for tropical storm Emily using heating rates derived from the SSM/I physical retrievals described in chapters 2 and 3. Average values of the latent heating rates from the convective and stratiform cloud simulations, used in the physical retrieval, are obtained for individual 1.1 km thick vertical layers. Then, the layer-mean latent heating rates are regressed against the slant path-integrated liquid and ice precipitation water contents to determine the best fit two parameter regression coefficients for each layer. The regression formulae and retrieved precipitation water contents are utilized to infer the vertical distribution of heating rates for forecast model applications. In the forecast model, diabatic temperature contributions are calculated and used in a diabatic initialization, or in a diabatic initialization combined with a diabatic forcing procedure. Our forecasts show that the time needed to spin-up precipitation processes in tropical storm Emily is greatly accelerated through the application of the data. Author

MOIST WIND RELATIONSHIPS

William H. Raymond *In its* Microwave (SSM/I) Estimates of the Precipitation Rate to Improve Numerical Atmospheric Model Forecasts 1990 12 p (For primary document see N94-18602 04-47)
(Grants NAGw-1855; NSF ATM-89-20508)
Avail: CASI HC A03/MF A02

The equations describing the temporal and spatial behavior of the kinematic moisture and heat flux are described. In these nonlinear equations, the contribution by diabatic processes to the large-scale flux is composed of two parts. One part is associated with a Rayleigh damping term while the other arises from temporal and spatial changes in the pressure gradient term. It was found that the influence of diabatic processes on large-scale moisture fluxes depends greatly on the degree of balance between forcing and damping terms in the governing kinematic flux equations. The existence of a near balance requires a reduction in the large-scale horizontal geostrophic wind speed. Based on an examination of the moisture flux equations, it is argued that reductions in the large-scale horizontal wind speed observed within major cumulus cloud systems help conserve large-scale moisture fluxes. The deviation of the wind from geostrophic conditions is easily estimated for a near balanced state. This wind modification induces secondary vertical circulations that contribute to convergence, creating or supporting long-lived mesoscale flows. We believe this process to be a major supporter of the mesoscale circulations observed in severe storms and squall lines. In the tropics the wind modification has an antitriptic relationship. These diagnostic findings suggest possible modifications to the wind field in the application of a cumulus parameterization, and may be important in diabatic initialization of numerical weather prediction models. INITIALIZATION AND ASSIMILATION OF CLOUD AND RAINWATER IN A REGIONAL MODEL

William H. Raymond and William S. Olson *In its* Microwave (SSM/I) Estimates of the Precipitation Rate to Improve Numerical Atmospheric Model Forecasts 1990 13 p (For primary document see N94-18602 04-47)
Avail: CASI HC A03/MF A02

The initialization and assimilation of cloud and rainwater quantities in a mesoscale regional model was examined. Forecasts of explicit cloud and rainwater are made using conservation equations. The physical processes include condensation, evaporation, autoconversion, accretion, and the removal of rainwater by fallout. These physical processes, some of which are parameterized, represent source and sink in terms in the conservation equations. The question of how to initialize the explicit liquid water calculations in numerical models and how to retain information about precipitation processes during the 4-D assimilation cycle are important issues that are addressed. SERCAA CLOUD ANALYSIS INTEGRATION: DESIGN CONCEPTS AND INTERACTION WITH CLOUD FORECAST MODELS Technical Report

Thomas M. Hamil and Ross Hoffman 16 Apr. 1993 60 p
(Contract F19628-92-C-0149)
(AD-A269104; PL-TR-93-2100; SR-1) Avail: CASI HC A04/MF A01

A new cloud analysis model to eventually replace the Real-Time Nephanalysis operating at the Air Force Global Weather Central is being prototyped. This new cloud analysis model will process multisource satellite data, geostationary and polar-orbiting, civilian and military. The output will be used primarily to initialize cloud forecast models but may be used also for climate research and other applications. This report reviews the customer requirements for cloud analysis data, the existing and future cloud forecast algorithms, and how the new cloud analysis model can integrate the multisource satellite data into one coherent analysis useful to all users. The likely approach for this 'analysis integration' will be to blend optimum interpolation techniques, common in numerical weather analysis, with a knowledge base commonly used in artificial intelligence. THE ACTIVITIES OF EQUATORIAL ANTICYCLONES OF THE WESTERN PACIFIC AND THE SOUTH CHINA SEA AND THEIR EFFECTS ON THE TRACKS OF TYPHOON MOVEMENT

Cheng-Lan Bao, Rong-Mao Wei, and Chang-Hua Huang 8 Sep. 1993 21 p Transl. into ENGLISH from Daqi Kexue, China, v. 3, no. 2, 1979 p 141-149
(AD-A269954; FASTC-ID(RS)T-0096-93) Avail: CASI HC A03/MF A01

This paper carries out a preliminary investigation and analysis of the activities of equatorial anticyclones over the western Pacific and South China Sea. They occur on average eight times a year and are mostly concentrated during the months of June-September. An equatorial anticyclone is a tropical weather system of meteorological magnitude of 1,000 - 2,000 km. It can continue on for a few days. It is a kind of a warm and high pressure system, and is often related to a fair weather system. The equatorial anticyclone clearly has an effect on the development of the typhoon genesis and the track of its movement. Once a deep, thick, and strong equatorial anticyclone appears to the south of a typhoon, the typhoon often seems to search for its path. However, the actual track of the typhoon is determined by the high pressure cooperative activities of the equatorial anticyclone and subtropics. This paper also presents several typhoon tracks for analyses. DTIC

INTEGRATED TERMINAL WEATHER SYSTEM (ITWS) Annual Report, 1992

James E. Evans 7 Sep. 1993 104 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F19628-90-C-0002)
(AD-A269884; ATC-203; DOT/FAA/RD-93/27) Avail: CASI HC A06

Hazardous weather in the terminal area is the major cause of aviation system delays as well as a principal cause of air carrier accidents. Several systems presently under development will provide significant increases in terminal safety. However, these systems will not make a major impact on weather-induced delays in the terminal area, meet a number of the safety needs (such as information to support ground deicing decisions), or reduce the workload of the terminal controller. The Integrated Terminal Weather System (ITWS) will provide improved aviation weather information in the allocated TRACON area (up to 50 nmi from the airport) by integrating data and products from various Federal Aviation Administration (FAA) and National Weather Service (NWS) sensors and weather information systems. The data from these sources will be combined to provide a unified set of safety and planning weather products for pilots, controllers, and terminal area traffic managers. By using data from multiple sensors, ITWS can generate important new products where no individual sensor alone could generate a single, reliable product. In other instances, use of data from several sources can compensate for erroneous data from one sensor and thus improve the overall integrity of existing products. Major objectives of the ITWS program are to increase the effective airport acceptance rate in adverse weather by providing information to support terminal automation systems, better terminal route planning, and wake vortex advisory services, and to reduce the need for controllers to communicate weather information to pilots via VHF voice. STATION CLIMATIC SUMMARIES, NORTH AMERICA. VOLUME 2: ALASKA, CANADA AND GREENLAND
Feb. 1993 258 p
(AD-A269793; USAFETAC/DS-93/031-2) Avail: CASI HC A12/MF A03

A collection of summarized monthly and annual climatic data for specific locations in North America is presented. Summarized climatological elements are: percent frequency of occurrence of ceiling and visibility; means, extremes, and number of days with specified values of temperature, precipitation, and snowfall; means of relative humidity, vapor pressure, dew point, pressure altitude, and cloud cover; prevailing wind direction, with mean and extreme speeds; and number of days with thunderstorms and fog. SOLAR RADIATION IN SAUDI ARABIA Final Technical Report, Mar. - Dec. 1992
Dorathy A. Stewart, Helmut P. Dudel, and Larry J. Levitt Jun. 1993 58 p
(AD-A269970; AD-E952102; AMSMI/TR-RD-WS-93-6) Avail: CASI HC A04/MF A01

Original solar irradiance data were obtained from the U.S. Air Force Environmental Technical Applications Center. These data were based on a model which used standard meteorological data and an albedo supplied by us. A procedure was developed to interpolate missing solar irradiances, and serially complete sets of hourly total solar irradiances were established for the three Saudi Arabian stations Riyadh, Dhahran, and Quisumah for the period January 1981 through July 1990. Tables of maximum, minimum, and mean daily totals; mean hourly values; and frequency distributions for noon are included. Comparison of monthly means and extremes with published data did not produce conclusive results. Considerable disagreement exists among published amounts of solar radiation reaching the surface in this region. The solar irradiance estimates in this report agree with the highest published values and should be considered upper limits. DTIC

AN INVESTIGATION OF WARM-CLOUD MICROPHYSICS USING A MULTI-COMPONENT CLOUD MODEL: INTERACTIVE EFFECTS OF THE AEROSOL SPECTRUM M.S. Thesis
Stephen G. Zahn Dec. 1993 118 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A270273; AFIT/CI/CIA-93-140) Avail: CASI HC A06

Clouds, especially low, warm, boundary-layer clouds, play an important role in regulating the earth's climate due to their significant contribution to the global albedo. The radiative effects of individual clouds are controlled largely by cloud microstructure which is itself sensitive to the concentration and spectral distribution of the atmospheric aerosol. Increases in aerosol particle concentrations from anthropogenic activity could result in increased cloud albedo and global cloudiness, increasing the amount of reflected solar radiation. However, the effects of increased aerosol particle concentrations could be offset by the presence of giant or ultragiant aerosol particles. A one-dimensional, multi-component microphysical cloud model has been used to demonstrate the effects of aerosol particle spectral variations on the microstructure of warm clouds. Simulations performed with this model demonstrate that the introduction of increased concentrations of giant aerosol particles has a destabilizing effect on the cloud microstructure. Also, it is shown that warm-cloud microphysical processes modify the aerosol particle spectrum favoring the generation of the largest sized particles via the collision-coalescence process. These simulations provide further evidence that the effect of aerosol particles on cloud microstructure must be addressed when considering global climate forecasts. DTIC

CONVECTION ALGORITHMS FOR MAGNETOSPHERIC PARTICLES Interim Report
Kevin J. Kerns 10 Aug. 1993 42 p
(AF Proj. 7601)
(AD-A270103; PL-TR-93-2183; ERP-1127) Avail: CASI HC A03/MF A01

This report documents in detail the implementation of the convection model used for the research by Kerns, Hardy, and Gussenhoven titled 'Modelling of Convection Boundaries Seen by CRRES in 120 eV to 28 keV Particles.' This research is to be published in the Journal of Geophysical Research, Space Physics in 1993. The convection model assumes an Earth centered dipole magnetic field with equipotential field lines and a static cross tail electric field. Convection results from EXB drifts and magnetic field gradient and curvature drifts. Algorithms are provided to calculate drift paths of particles as well as to calculate the energy range of particles at a specified position that are on open drift paths to the magnetospheric tail. The algorithms presented in this document are optimized to converge to a solution quickly for any particle energy, position, and equatorial pitch angle. These algorithms are implemented in the CRRES survey software called SHOWLEPA.EXE which was used in support of the research. DTIC

EASTERN EUROPE: A CLIMATOLOGICAL STUDY
Kathleen M. Traxler, Richard D. Arnold, John W. Louer, III, Michael T. Gifford, and Kenneth R. Gibson Jul. 1993 379 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A269200; USAFETAC/TN-93/004) Avail: CASI HC A17

This document presents a climatological study of Eastern Europe, a region that comprises Poland, the Czech Republic, Slovakia, Hungary, Romania, the former Yugoslavia, Albania, Greece, Latvia, Lithuania, Estonia, Belarus, Moldova, Ukraine, Azerbaijan, Armenia, Georgia, Turkey west of the Sea of Marmara, and also Russia, Kazakhstan, Uzbekistan, and Turkmenistan west of 60 deg E, including Novaya Zemyla. For this study, the entire region is divided into eight zones of climatic commonality. After describing the general geography of Eastern Europe, the study discusses major meteorological features of the entire region. Geography and the major climatic controls for each of the eight climatic commonality zones are then described. Finally, each season is defined and discussed in considerable detail, to include typical weather, clouds, visibility, winds, precipitation, temperature, and weather hazards. DTIC

SEASONAL VARIABILITY OF WIND ELECTRIC POTENTIAL IN THE US
M. N. Schwartz, D. L. Elliott, and G. L. Gower Jul. 1993 8 p Presented at the Windpower 1993, San Francisco, CA, 12-16 Jul. 1993
(Contract DE-AC06-76RL-01830)
(DE93-018182; PNL-SA-22090; CONF-930726-4) Avail: CASI HC A02/MF A01

Seasonal wind electric potential has been estimated for the contiguous United States based on the methods previously used to estimate the annual average wind electric potential. National maps show estimates of the seasonal wind electric potential averaged over the state as a whole, and gridded maps show the distribution of the seasonal wind electric potential within a state. The seasons of winter and spring have highest wind electric potential for most windy areas in the United States. Summer is the season with the least potential for most of the contiguous United States. Wind electric potential patterns in autumn generally resemble the annual average potential map. Excellent matches between seasonal wind electric potential and electric energy use occur during winter for the northern parts of the nation. California has a good match between summer wind potential and electric use. DOE

Mechoso (California Univ., Los Angeles.), and J. A. Spahr (California Univ., Los Angeles.) 15 Feb. 1993 14 p Presented at the 2nd International Symposium on High-Performance Distributed Computing, Spokane, WA, 20-23 Jul. 1993
(Contract W-7405-eng-48)
(DE93-019156; UCRL-JC-113039; CONF-9307111-2) Avail: CASI HC A03/MF A01

As part of a long range plan to develop a comprehensive climate systems modeling capability, the authors have taken the Atmospheric General Circulation Model originally developed by Arakawa and collaborators at UCLA and have recast it in a portable, parallel form. The code uses an explicit time-advance procedure on a staggered three-dimensional Eulerian mesh. The authors have implemented a two-dimensional latitude/longitude domain decomposition message passing strategy. Both dynamic memory management and interprocessor communication are handled with macro constructs that are preprocessed prior to compilation. The code can be moved about a variety of platforms, including massively parallel processors, workstation clusters, and vector processors, with a mere change of three parameters. Performance on the various platforms as well as issues associated with coupling different models for major components of the climate system are discussed. DOE

SHAPE OF WIND GUSTS AT A 130m TOWER AT WILHELMSHAVEN (GERMANY) [BESTIMMUNG VON BOEEN GEMESSEN AN EINEM 130M-MAST BEI WILHELMSHAVEN]

G. Tetzlaff, K.-J. Schreiber, M. Kotzian, J. Rissmann, and E. Hollwurtel 1992 208 p In GERMAN
(Contract BMFT-0328787A)
(Ber-Band-B3; ISBN-3-92-362422-0; ETN-93-95096) Avail: CASI HC A10/MF A03

A tower equipped with wind sensors at different levels above the ground is described. The tower had a triangular cross section with a side length of 1 m; the length of the sensor carrying booms was slightly more than 3 m, thus minimizing the wake effects of the main body of the tower. The main sensors were three component propeller anemometers, tilted at an angle of 45 degrees into the main wind direction to avoid the stagnation sector of a vertically oriented propeller. Cup anemometers, wind vanes, and radiation shielded thermometers were installed. The data of the propeller anemometers were sampled at a rate of about 3 Hz. They served for online calculation of several coproducts as a basis for the computation of fluxes and stresses. The data of all sensors were processed into one hour average values of wind data and several derived quantities. Gusts were sampled by event triggering. The event trigger was set if a certain threshold was exceeded, either in the horizontal or vertical windspeed change. The main interest was concentrated on large gusts of more than 60 m vertical extension and with large changes of the wind speed, both horizontally and vertically. Closer analysis of these gusts gave shape and spatial distribution of the windspeed changes. A gust of more than 60 m size and more than 10 m/s(exp 2) wind speed change does occur with a probability of about 2 such events per year. ESA

INVESTIGATIONS OF A COHERENT VECTOR RADAR TECHNIQUE FOR THE OBSERVATION OF THE ATMOSPHERE NEAR 10 GHz Thesis - Karlsruhe Univ. [UNTERSUCHUNGEN EINES KOHAERENTEN VEKTORIELLEN RADARVERFAHRENS ZUR BEOBACHTUNG DER ATMOSPHAERE BEI 10 GHZ]

D. Graebe Dec. 1992 65 p In GERMAN
(KfK-5068; ETN-93-95078) Copyright Avail: CASI HC A04/MF A01

A radar measurement system built on the basis of a vector network analyzer and its capability are examined. The main feature of this system is the measurement technique, where the received signal is analyzed for magnitude and phase. The subsequent fast Fourier transformation provides the representation of the radar echo over the delay time. To characterize the system parameters a reference line was set up to a mast at a distance of approximately 700 m. First measurements show that static targets with small radar cross sections are detectable. For typically weather phenomena like clouds and rain the resolution limit are shown. Consequences for the design of future measurement systems are described. ESA

The WAQUA/CSM-16 model for the forecasting of water levels at the Dutch coast is presented. The WAQUA system solves the nonlinear shallow water equations and calculates the astronomical tide as well as the meteorological effect on water levels and currents. The CSM-16 model covers the whole continental shelf. The parameters' topography and surface roughness are adjusted to represent the astronomical tide as well as possible. The wind drag coefficient is also treated as a parameter. A data assimilation scheme using a Kalman filter was introduced to compensate information errors. Suggestions for further developments are given. ESA

CALAMITY WEATHER: ENVIRONMENTAL CALAMITIES AND METEOROLOGY [RAMPENWEER, OVER MILIEU CALAMITEITEN EN METEOROLOGIE]
Frank Kroonenberg *In its* Reports of the 1992 Synoptic Symposium 1993 p 54-59 In DUTCH (For primary document see N94-19698 04-47)
Copyright Avail: Issuing Activity (Royal Netherlands Meteorological Inst., Postbus 201, 3730 AE De Bilt, Wilhelminalaan 10, Netherlands)

The treatment of calamities by the KNMI (Royal Netherlands Meteorological Institute) is outlined. The KNMI is confronted with three types of calamities: calamities caused by meteorological circumstances; industrial calamities, the effects of which on public health are determined by meteorology; and other calamities for which meteorological circumstances in principle do not play a role. The calamity coordinator mainly has to deal with the second type of calamity. The demand from society and the societal relevance of the KNMI are growing. The meteorological aids at the disposal of the calamity meteorologist are outlined. ESA

A ONE DIMENSIONAL NUMERICAL MODEL, WITH AN APPLICATION TO THE VERTICAL DISTRIBUTION OF DISSOLVED OXYGEN IN THE OCEAN
D. E. Eliason May 1993 25 p
(Contract W-7405-eng-48)
(DE93-018481; UCRL-MA-114027) Avail: CASI HC A03/MF A01

This manual describes the one dimensional model M1D, and its application to the vertical distribution of dissolved oxygen in the ocean. Section 2 describes the partial differential equation upon which the model is based, and the required boundary conditions. Section 3 gives the finite difference equations used to approximate the partial differential equations, and the scheme used for their solution. In Section 4, a linear stability analysis of the finite difference equations is given. Section 5 describes the program M1D that implements the solution of the finite difference equations. The program description is done from a programmer's point of view, especially with regard to parameters that control the simulation, location of variables on the grid, and the output file. A flow chart of the solution algorithm is also provided in this section. Section 6 presents some results of using the model to simulate the vertical distribution of oxygen in the ocean. Comparisons of model results to an analytical solution and to measured data from the North Eastern Tropical Pacific are given in this section. Finally, a summary and conclusions are presented in Section 7. DOE

DESIGN OF A GENERAL PURPOSE AND AUTONOMOUS TRANSMITTER AND RECEIVER SYSTEM FOR UNDERWATER ACOUSTIC EXPERIMENTS AT SEA Final Report, 1 Oct. 1988 - 30 Sep. 1992
Hien Nguyen, Harry Deferrari, and Neil Williams 31 Aug. 1993 43 p
(Contract N00014-89-J-1356)
(AD-A269268) Avail: CASI HC A03/MF A01

A versatile multi-frequency, multi-purpose acoustic transmitter and receiver system has been developed and used to measure low frequency acoustic backscatter from the ocean wave surface. The instrumentation is general purpose in that all signal and sample parameters are selected by software and a variety of transmission, scattering, and reverberation experiments are possible without hardware modification. The system is

battery-powered and self-contained for remote and unattended operation for periods of months, depending upon the experimental parameters that affect power and tape consumption. The main features of the system are: a high powered broadband set of acoustic sources-with center frequencies of 100, 200, 400, and 800 Hz; programmable output signal types; a 64 element vertical hydrophone array; twenty gigabytes of data storage capacity; dynamically-tuneable band pass filters and variable sampling rates, high power microprocessors for in-situ signal processing; and independent subsystems for recording mooring depth and inclination. The system has been used in surface backscattering experiments at sea and results that demonstrate the capability of the system are presented and discussed.

THE PERFORMANCE OF DRAG RELATIONS IN THE WAQUA STORM SURGE MODEL
J. R. N. Onvlee Jan. 1993 30 p
(Contract MAST-0050-C(PROFILE))
(KNMI-TR-149; ISBN-90-369-2030-2; ETN-93-94534) Copyright Avail: Royal Netherlands Meteorological Institute, P.O. Box 201, 3730 AE De Bilt, Wilhelminalaan 10, Netherlands

In most storm surge models, a drag relation is applied which parametrizes the wind induced surface stress in terms of wind velocity alone. In the WAQUA/CSM-16 model, used to predict water elevations along the Dutch North Sea coast, the wind stress was modeled until recently by the linear drag relation of Smith and Banke (1975). A number of alternatives to this relation have been suggested. For two of these, a piecewise continuous function provided by the Tidal Waters Division of Rijkswaterstaat and a Charnock drag formulation, the performance within the WAQUA system was evaluated and compared to that of the Smith and Banke function. Fore and hindcast analyses were made for all three drag relations for several periods of various types of weather, including four recent storms. Both the Charnock and Rijkswaterstaat drag relations represent a significant improvement over the Smith and Banke drag coefficient, particularly in the prediction and reconstruction of powerful surges during storm conditions. The Charnock and Rijkswaterstaat functions yield similar results for all weather types, the Charnock coefficient on average resulting in a slightly better agreement with observed surge levels; the standard deviation of the model errors is significantly smaller for the Charnock function. On the basis of these observations it is recommended that the Charnock drag formulation be implemented in the operational WAQUA system in the near future.

SEASOAR AND CTD SECTIONS ACROSS THE ICELAND-FAEROES FRONT AND FAEROE SHETLAND CHANNEL, AUGUST 1990
J. T. Aleen, J. F. Read, S. G. Alderson, and H. Desai 1992 121 p
(IOS-295-1992; ETN-93-94558) Avail: CASI HC A06/MF A02

In Aug. 1990, RRS Charles Darwin Cruise 51 made two Conductivity/ Temperature/ Depth (CTD) and four SeaSoar sections across the inflow to the GIN Seas in addition to one large scale SeaSoar survey of the Iceland-Faeroes front, and three repeat fine scale SeaSoar surveys of a selected region of the front. Sections of temperature, salinity, and derived parameters including sound speed are presented. The data provide detailed information to identify water mass characteristics and indicate their relative locations. In addition, the SeaSoar surveys of the Iceland-Faeroes front present a time sequence in which the generation and development of meanders and eddies may be observed.

CTD OXYGEN, TRACER AND NUTRIENT DATA FROM RRS CHARLES DARWIN CRUISES 58/59 IN THE NE ATLANTIC AS PART OF VIVALDI 1991
G. Griffiths, S. Cunningham, M. Griffiths, R. T. Pollard, H. Leach, S. Holley, R. Paylor, T. W. N. Haine, A. Rios, and S. G. Alderson et al 1992 49 p
(IOS-296-1992; ETN-93-94559) Avail: CASI HC A03/MF A01

CTD (Conducting/ Temperature/ Depth) and sample data recorded on Cruises 58 and 59 of RRS Charles Darwin are reported. The cruises were a trial of the Vivaldi concept of seasonal surveys of the north east Atlantic. The concept uses a combination of deep CTD stations spaced at 300 km with SeaSoar tows between to map the ocean over a wide area with high resolution in the upper layers where seasonal changes are important. Vivaldi forms part of the U.K. contributions to the World Ocean Circulation Experiment. Forty deep CTD stations were occupied using CTD with an oxygen sensor and a 24 bottle rosette sampler. A transmissometer and a fluorometer were also mounted on the package. Water samples were analyzed for dissolved oxygen, salinity, nitrate, silicate phosphate, chlorofluorocarbons (CFC-11, CFC-12 and CFC-113), chlorophyll-a, and, on Cruise 58, for alkanity and pH. Contoured sections of the CTD and water sample measurements are shown, with listings of all sample data and listings at selected depths of standard variables from the CTD stations. Instrument calibrations are also reported and the quality of data is discussed.

SEASOAR CTD, FLUORESCENCE AND SCALAR IRRADIANCE DATA FROM RRS CHARLES DARWIN CRUISES 58/59, NE ATLANTIC, VIVALDI 1991
S. A. Cunningham, M. J. Griffiths, S. G. Alderson, G. Griffiths, R. T. Pollard, J. C. Donlan, P. Lancaster, H. Leach, R. K. Lowry, and M. W. Stirling et al 1992 46 p
(IOS-299-1992; ETN-93-94562) Avail: CASI HC A03/MF A01

SeaSoar data from RRS Charles Darwin Cruise 58 and 59 (24 Apr. - 9 Jun. 1991) are reported. Data were collected on the northeast Atlantic between 39 to 54 deg north, 11 to 34 deg west. With the aid of a new winch, SeaSoar undulated between the surface and 500 m every 2.5 km, measuring Conductivity/ Temperature/ Depth (CTD) data with a double conductivity cell CTD unit. Chlorophyll 'a' and scalar irradiance were also measured. Six meridional legs, four degrees apart, were surveyed. The western four legs were 1500 km long and the others 900 km and 600 km. The legs were surveyed in three degree sections between full depth CTD casts. The meridional legs were joined by seven zonal sections. Processing and calibration of the data are described and the data are presented as contoured sections. Variables contoured against pressure are potential temperature, salinity, sigma0, sound velocity, scalar irradiance, and cholorophyll. Temperature and salinity are also contoured against sigma0. The aims of Vivaldi are to calculate seasonal upper ocean heat and fresh water budgets, map isopycnic potential vorticity variations from the subtropical gyre to the subpolar gyre, map interannual changes in the properties of water masses formed by deep convection, calculate statistics of upper ocean parameters and air sea fluxes, and to investigate the role of eddies.

TECHNOLOGIES FOR ASSESSING THE GEOLOGIC AND GEOMORPHIC HISTORY OF COASTS Final Report
Andrew Morang, Joann Mossa, and Robert J. Larson Mar. 1993 175 p
Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A268780; CERC-93-5) Avail: CASI HC A08

The geologic and geomorphic history of coastal areas can be assessed using a four-part process: thorough examination of technical literature and existing data from various archives; field data collection and observation; laboratory examination of samples collected in the field; and office interpretation of all project data, both newly collected and historic. It is vital that existing sources of data be evaluated before field studies are undertaken to prevent duplicating efforts and to guide the optimum sampling scheme. Field studies must be designed to answer basic questions about the study area: What physical processes affect the region? Does the underlying geology have a major influence? How has man modified or damaged the local environment? How much data can we afford to collect? Do we have the knowledge, ability, managerial skill, or money to properly analyze the data we want to collect at the project site? Is it more important to conduct a long-term sampling program or a shorter, more intensive program? Coastal scientists must be aware of how historic data were collected and what assumptions and procedures were used by the original field technicians and analysts. The quality of historic data may vary from excellent to worse than useless. The use of instruments in the coastal zone is far from straightforward; incorrect use of instruments may lead to erroneous results because the wrong parameters may be monitored. Coastal engineers are urged to consult specialists in the field to help plan and conduct field studies. The analysis of contemporary coastal data is difficult and also requires the skills of specialists with experience in the particular types of instruments and methods that have been used. DTIC

SYNOPTIC OCEAN PREDICTION EXPERIMENT. EN216 CTD SECTION DATA REPORT Summary Report, 29 Aug. - 1 Sep. 1990
Dana K. Savidge, Thomas J. Shay, and John M. Bane, Jr. Mar. 1993 21 p
(Contracts N00014-90-J-1596; N00014-90-J-1568; NSF OCE-87-17141; NSF OCE-87-17144)
(AD-A268903; CMS-93-1) Avail: CASI HC A03/MF A01

A CTD section was taken across the Gulf Stream during late Aug. 1990, approximately 100 km downstream from Cape Hatteras. The work was done from the R/V Endeavor during the third leg of cruise EN216, which was part of the Synoptic Ocean Prediction (SYNOP) program. The section consisted of 12 stations located along a line from 34 deg 50 min N, 73 deg 10 min W to 35 deg 57.23 min N, 74 deg 43.14 min W, spaced 8 to 30 km apart. The Seabird Sealogger utilized was equipped with conductivity, temperature, pressure, and oxygen sensors. Nominal drop speed was 0.5-1.0 m/s, with a sampling rate of 1 Hz. This report discusses the acquisition and processing of the CTD data obtained along this section. In addition, plots of potential temperature vs. salinity, salinity vs. pressure, potential temperature vs. pressure, and oxygen vs. pressure are shown for each station. Vertical sections of salinity, potential temperature, density, and oxygen are also presented. DTIC

AN ATLAS OF BATHY-THERMOGRAPH TEMPERATURE CROSS-SECTIONS FOR CORAL AND TASMAN SEA TRANSECTS FROM 1960 TO 1987
L. J. Hamilton Apr. 1993 32 p
(AD-A268775; MRL-TN-620; DODA-AR-008-219) Avail: CASI HC A03/MF A01

An atlas of 190 temperature cross-sections is presented for the Tasman and Coral Seas for 1960 to 1987. The sections were constructed from bathy-thermograph (BT) temperature profiles obtained by ships on routes between Australia, New Zealand, and Fiji in the region 20-50 S, 150-180 E. About 150 sections lie on six major routes, e.g. 50 sections are available from Sydney to New Zealand along 34 S, and 40 sections from Sydney to Fiji. Depth of sections is nominally 450 m. The sections provide the background for an examination of Tasman and Coral Sea surface flow and temperature structure presented elsewhere. Data were obtained from the Australian Oceanographic Data Center. DTIC

The recent changes in global politics that we all have experienced have also led to a rethinking of naval strategy. This strategy has been summarized in the White Paper '...From the Sea'. The primary message of this new policy is that the Navy will refocus from deep water operations to coastal and over-the-shore operations. The goal of the Coastal Ocean Modeling Workshop is to review ongoing work in light of this changing strategy and to recommend a program that is responsive to these changes. In doing so, the aim is to assure that the objectives of the Navy Ocean Modeling and Prediction Program are in line with Navy/Marine Corps operational needs for environmental products and that modeling efforts yield products that are optimized for rapid implementation into operational environments. WIND PRODUCTS FOR USE IN COASTAL WAVE AND SURGE MODELS Final Report
Zeki Demirbilek, Steven M. Bratos, and Edward F. Thompson Aug. 1993 136 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A269753; CERC-MP-93-7) Avail: CASI HC A07

Winds over the ocean surface are the essential driving force in creating waves. Winds also have important effects on currents and nearshore water levels. Wind information is often used within the Corps of Engineers (CE) as input to numerical models of waves, storm surges, and circulation. The National Oceanic and Atmospheric Administration (NOAA) and the U.S. Navy routinely produce global wind information. Recent advances in atmospheric modeling capabilities and operational numerical models, particularly within the Navy, have made available new and improved products applicable to CE hydrodynamic modeling. Available products from NOAA and the Navy are described including both climatological archives and real time forecasting products. Interfaces to assist CE users in obtaining and using the Navy products are presented. Sources of surface wind (10-m elevation) information of greatest potential value for CE modeling are evaluated using the wave model WISWAVE and NOAA National Data Buoy Center measurements along the U.S. Atlantic coast. Necessary tools are provided and recommendations are given for further evaluation and use of Navy wind information in future modeling efforts. DTIC

ADCIRC: AN ADVANCED THREE-DIMENSIONAL CIRCULATION MODEL FOR SHELVES, COASTS, AND ESTUARIES. REPORT 3: DEVELOPMENT OF A TIDAL CONSTITUENT DATABASE FOR THE WESTERN NORTH ATLANTIC AND GULF OF MEXICO
J. J. Westerink (Notre Dame Univ., IN.), R. A. Luettich, Jr. (North Carolina Univ., Chapel Hill.), and Norman Scheffner Jun. 1993 151 p
(AD-A268685; CERC-TR-92-6) Avail: CASI HC A08/MF A02

This report describes the application of model ADCIRC-2DDI, a two-dimensional, depth-integrated, finite-element-based hydrodynamic circulation code, to the western North Atlantic, Gulf of Mexico, and Caribbean Sea in order to develop a tidal constituent database. Issues that are emphasized in the development of the Western North Atlantic Tidal (WNAT) model include the definition of hydrodynamically simple open ocean boundaries; the use of large domains; the importance of a high degree of grid resolution in coastal regions; and the use of finite element meshes with highly varying nodal densities in order to minimize the size of the discrete problem. The development of an optimal graded finite element mesh is based on regular and graded grid convergence studies using an M2 tidal forcing function on the boundary and within the domain. The optimal graded mesh is then forced for eight diurnal and semidiurnal astronomical tidal constituents (K1, O1, Pl, Ql, M2, S2, N2, and K2) on the open ocean boundary by coupling to Schwiderski's global model results as well as within the interior domain using a tidal potential forcing function. The structure of the various tides is examined and results are compared to field data at 77 stations. DTIC

THREE-DIMENSIONAL HIGH-RESOLUTION SEISMIC PROFILING ON THE NEW JERSEY OUTER CONTINENTAL SHELF Final Technical Report
John D. Milliman 1993 2 p
(Contract N00014-89-K-0148)
(AD-A269835) Avail: CASI HC A01/MF A01

Previous work using the Huntec Deep-Towed Seismic (DTS) system off New Jersey (1987) identified a thick sequence of late Pleistocene sediments on the outer continental shelf. It was suggested that these sediments were deposited by several major melt events during the late Wisconsin glaciation. The physical nature of the sediments, their stratigraphic relation with acoustic stratigraphy and the fine-scale variations of both reflectors and topographic character, however, can be defined only through sediment coring and closely spaced high-resolution profiling. The purpose of this project was to obtain a series of vibrocores to determine the stratigraphic and sedimentologic character of the sediments and to obtain digital data that would allow us to gain a three-dimensional understanding of the shallow structure on the sedimentary sequences in the area. CONSTRAINTS ON CRUSTAL STRUCTURE FROM LONG PERIOD PRESSURE AND DISPLACEMENT MEASUREMENTS ON THE DEEP SEAFLOOR Final Report, 1 Oct. 1990 - 30 Sep. 1992
Spahr C. Webb Apr. 1993 8 p
(Contract N00014-91-J-1088)
(AD-A269931; MPL-U-22/93) Avail: CASI HC A02/MF A01

Accurate estimates of seafloor shear and compressional velocities are essential for modelling long range acoustic propagation within the ocean. Compressional wave velocities have been measured using seismic refraction techniques for decades, however shallow seafloor structure is poorly resolved with sources and receivers located near the sea surface. Shear velocity is poorly known at all depths; since the ocean does not support shear propagation, only converted waves are observable at the sea surface. At MPL we have developed instrumentation capable of measuring the very small seafloor deformations resulting from very low frequency surface gravity waves (infragravity waves). By measuring a number of sites we will study the elastic changes associated with aging of the oceanic crust. We investigated the inverse problem associated with this technique which allows a quantitative connection between measured seafloor transfer functions and the elastic properties of the shallow crust. PREPARATION OF DATA ASSIMILATION AND MODEL EVALUATION EXPERIMENT DATA SETS
C. A. Lai and Wen Qian Aug. 1993 145 p
(Contract N00014-92-J-4112)
(AD-A269996; TR-1/94) Avail: CASI HC A07/MF A02

The goal of DAMEE is briefly stated because it provides the rationale for the experiment plan which decides the data need for the four phases of the experiment. The preparation of the DAMEE data set consisted of a series of processes: (1) collection of observational data; (2) analysis and interpretation; (3) interpolation, using the Optimum Thermal Interpolation System (OTIS) package; (4) quality control and re-analysis; and (5) data archiving and software documentation. The data products from these processes included a time series of 3-D fields of temperature and salinity, 2-D fields of surface dynamic height, 2-D bogus information of the Gulf Stream and rings system and XBT profiles. To date, they are the most detailed and high-quality data for mesoscale modeling, data assimilation, and forecasting research. Feedback from ocean modeling groups who tested them were incorporated into the refinement of data. It is intended to make this data set easy to access. An ideal way is to put it into a few CD-ROM's. Suggestions for DAMEE data usage include the following: (1) ocean modeling and data assimilation; (2) diagnosis and theoretical studies; and (3) comparisons with locally detailed observations, such as those in the SYNOP project to guide field programs. FULL BOLTZMANN DISCRETE SPECTRAL WAVE MODEL, IMPLEMENTATION AND NONDIMENSIONAL TESTS Final Report
Donald T. Resio Aug. 1993 52 p
(AD-A269885; CERC-93-1) Avail: CASI HC A04/MF A01

A full Boltzmann integration scheme is implemented within a functioning discrete spectral wave model. Preliminary testing (academic) is presented and compared to alternate solution methods. It is found that third-generation models depend on a detailed balance among source terms, and it is important that these source terms be specified accurately. In the present state of the art, information on all of the source terms does not appear to be sufficient to permit definitive estimates of all source terms in the detailed balance evaluations. Older means of estimating the nonlinear wave-wave interaction (Sn1) are much less accurate than the full Boltzmann method. Even the Discrete Interaction Approximation (WAMDIG 1988) representation for Sn1, used in the only documented third-generation wave model (WAM), is shown incapable of providing an accurate estimate of Sn1. The full Boltzmann model should provide an improved method to investigate several important wave generation and decay situations. The WAM source terms are inconsistent with observed wave-growth laws and equilibrium-range behavior from the Joint North Sea Wave Project (Hasselmann et al. 1973). New source terms postulated in this report provide a very good match to the JONSWAP wave growth rates and equilibrium-range behavior. The present version of the full Boltzmann model should be regarded as a research tool. It is a very new model and, as such, will need to undergo considerable additional testing over several years before it could be considered as a viable option for an operational model. DTIC

DYNLET1 MODEL FORMULATION AND USER'S GUIDE Final Report
Mary A. Cialone and Michael Amein (Civil Analysis Group, Inc., Raleigh, NC.) Aug. 1993 62 p
(AD-A269843; CERC-93-3) Avail: CASI HC A04/MF A01

A state-of-the-art design-level model for predicting tide-dominated velocities and water level fluctuations at an inlet and interior back-bay system and detailed instruction in use of the model are presented. The model solves the full one-dimensional (1-D) shallow-water equations employing an implicit finite-difference technique. The model is named DYNLET1, reflecting the fact that it is a 1-D model of the dynamic (time-dependent) behavior of the tidal flow at inlets. The DYNLET1 numerical model was originally developed by Dr. Michael Amein, Civil Analysis Group, Inc., Raleigh, North Carolina, under contract to the U.S. Army Engineer Waterways Experiment Station (WES) Coastal Engineering Research Center (CERC). The model is capable of simulating 1-D fluid flow from the ocean through a tidal inlet, into back-bay regions, and up tributaries. An important feature of the model is the ability to represent an accurate flow distribution across any cross section, given the inherent limitations of a 1-D model. DYNLET1 has a rigorous theoretical foundation, is numerically implemented in a sound manner, and is capable of describing realistic situations. It provides detailed velocity information across the inlet channels, is able to describe multi-channel inlets, and importantly, is easy to operate on a personal computer. The model can be used for design-level studies for most inlets by providing reliable and accurate answers while requiring minimal modeling expertise, data entry, and numerical grid generation. DTIC

ATLAS OF SSM/I SATELLITE ICE CONCENTRATION INTERPOLATED TO OPERATIONAL ICE MODEL DOMAINS OF THE ARCTIC FOR 1992 Final Report
G. N. Lundeen, R. H. Preller, P. G. Posey, and A. Cheng Sep. 1993 320 p
(AD-A270306; NRL/MR/7322-93-7064) Avail: CASI HC A14/MF A03

The Navy's Polar Ice Prediction System, which is run daily at the Fleet Numerical Oceanography Center (FNOC), is initialized once a week from ice concentration data derived by the Navy/National Oceanic and Atmospheric Administration Joint Ice Center. Ice concentration data, derived by applying the U.S. Navy's algorithm to the Defense Meteorological Satellite Program Special Sensor Microwave Imager (SSI) data, have been collected from FNOC on a daily basis and archived at the Naval Research Laboratory. These data were interpolated to the operational ice model grids for possible use as real-time daily update to the operational forecast systems. Collection of data with coverage from the Pole southward to 400 N latitude allows for the observation of ice concentrations for the entire Arctic region and surrounding coastal seas. SSM/I ice concentration data from 1992 are presented for each available day and on each of the operational model grids. DTIC

MODIFICATIONS OF AIRBORNE OCEANOGRAPHIC LIDAR FOR THE LONG RANGE P-3 MISSIONS Final Report, 1 Mar. 1992 - 30 Sep. 1993
Richard E. Berry 1993 4 p
(Grant NAG5-689)
(NASA-CR-194682; NAS 1.26:194682) Avail: CASI HC A01/MF A01

This has been an extraordinary series of Airborne Oceanographic Lidar (AOL) missions. The AOL was flown over the North Pole on three low altitude sea ice mapping flights. These flights were followed by six Joint Global Ocean Flux Study (JGOFS) flights based from Hawaii and Christmas Island to measure chlorophyll along the equator. On return to the west coast, there were several terrain mapping flights in Nevada and Arizona. This was followed by mapping of the Greenland ice cap from the airport at Sondresstrom Greenland. This research proposal was developed to support the AOL instrumentation research that prepares the AOL for each science mission. Saint Vincent College physics professor, Dr. Richard Berry, is engaged in LIDAR instrumentation research to improve the AOL. Dr. Berry's participation in the AOL mission was to implement the instrumentation modifications that optimized data acquisition. Derived from text

ESTIMATING THE OCEANIC SOUND SPEED ENVIRONMENTAL FOR LONG-RANGE ACOUSTIC PROPAGATION Final Report
Janice D. Boyd Aug. 1993 91 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A270231; NRL/MR/7332-93-7068) Avail: CASI HC A05

The High Gain Initiative (HGI) Program was established in 1987 as a focused Block Program of the office of Naval Technology (now part of the Office of Naval Research). One of its objectives was to investigate the oceanic environment and its effects on long-range sound transmission. One potential important factor was identified as imprecise knowledge of the oceanic sound speed field. Substantial Program resources were therefore invested in devising and executing sound speed measurement programs for two major field experiments, VAST (Various Acoustic Systems Tests) and MDA (Multi-Dimensional Array), which took place in 1989 in the Northeast Pacific and in 1991 in the western Subtropical Atlantic, respectively. This document reviews available oceanic sound speed measurement techniques, describes the combinations of techniques and strategies that made up each experiment's measurement plan, summarizes the results and the sound speed environment during each experiment, and evaluates what the work has revealed to date about sound speed uncertainties and long-range sound transmission. BACKSCATTER.FOR: A PROGRAM TO CALCULATE THE BACKSCATTERING STRENGTH OF AN INHOMOGENEOUS SEABED
Aug. 1993 23 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A269235; DREA-TC-93/306) Avail: CASI HC A03

The author has previously reported on a theoretical model for acoustic backscattering from an inhomogeneous volume beneath a smooth water/sediment interface. In spite of the good agreement between model and data obtained by the author, the model's complexity somewhat undermines its usefulness to other users. To alleviate this drawback, a user's manual for the FORTRAN 77 code developed by the author to evaluate the model is presented in this paper. To assist potential users of the software, the interpretation of the model in terms of the FORTRAN 77 code employed is explained and a sample run is presented. DTIC

METHOD FOR EXTRACTING TIDAL AND INERTIAL MOTION FROM ARGOS ICE BUOYS APPLIED TO THE BARENTS SEA DURING CEAREX
P. Turet (Washington Univ., Seattle.), C. H. Pease, R. S. Pritchard (IceCasting, Inc., Seattle, WA.), and J. E. Overland Apr. 1993 69 p
(PB93-190213; NOAA-TM-ERL-PMEL-99) Avail: CASI HC A04/MF A01

A harmonic analysis of tidal and inertial motion was applied to observations of position of ARGOS buoys deployed on drifting multiyear sea ice in the Eastern Arctic-Barents Sea during CEAREX (1988-89). An ARGOS positioning-data screening protocol was developed and constructed using a constrained least squares algorithm for separate estimation of tidal and inertial currents. The analysis provided estimates of individual tidal components at 15-day intervals along the sea ice buoy drift tracks. The technique shows a reasonable qualitative distinction in current components at nearby semi-diurnal frequencies. Estimates of errors due to sampling and collinearity are derived directly from model statistics. Estimates of velocity produced from the unequally time-based data are then used for interpolation to a regular time grid for spectral analysis. Computed velocities (up to 70 cm/s for M(2) tidal motion over Spitsbergen Bank southeast of Svalbard) are in close agreement with the regional tidal model of Gjevik, et al. (1990, 1993). NTIS

ACOUSTIC TRAVEL TIME PERTURBATIONS DUE TO AN INTERNAL TIDE AND INTERNAL WAVE FIELD IN THE BARENTS SEA M.S. Thesis
Douglas S. Ray Aug. 1993 73 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00123-89-G-0580)
(AD-A270879) Avail: CASI HC A04

Travel time perturbations of adiabatic normal modes due to an internal tide and internal mode field in the Barents Sea are examined. A formalism for the travel time perturbation due to a change in sound speed is presented. Internal tide and internal wave amplitude spectra are calculated from Brancker temperature loggers which were deployed on moorings in the Barents Sea during the August 1992 Barents Sea Polar Front Experiment. In particular, the first three internal wave mode amplitudes are estimated from the four Brancker temperature loggers on the southwest mooring of the array. Modal perturbations in acoustic pulse travel time and the travel time covariance are calculated and compared for consistency to a simple ray model. These perturbations are small for the modal arrivals that the vertical acoustic array which was deployed is expected to resolve. The third internal wave mode has the largest impact on the acoustic arrivals, per unit amplitude, but the first internal wave mode dominates the scattering due to having a much larger amplitude overall. MODELING OF CURRENT FEATURES IN GULF STREAM SAR IMAGERY Interim Report
Robert W. Jansen, Scott R. Chubb, Robert A. Fusina, and Gasper R. Valenzuela 13 Sep. 1993 57 p
(AD-A270734; NRL/MR/7234-93-7401) Avail: CASI HC A04/MF A01

The theoretical formulation, numerical implementation, and testing of NRL's recently developed time-dependent ocean wave model (NTOW) is described. The propagation of the wave field is computed via the action density conservation equation for general time varying currents, winds, and bathymetry. The NTOW model is used to predict wave-current interaction effects in a region of strong surface convergence near the edge of the Gulf Stream off Cape Hatteras. The computed wave field is used in conjunction with a composite scattering radar model to derive radar imagery. Our radar predictions are compared with real aperture radar data collected during the NRL high-resolution remote sensing experiment. DTIC

ANALYSIS OF DATA FROM COLUMBIA POINT ARENA OCEAN-BOTTOM SEISMIC STATION (OBSS) Final Technical Report
G. M. Purdy and G. H. Sutton 1993 9 p
(Contract N00014-90-J-1916)
(AD-A271263) Avail: CASI HC A02/MF A01

This research was the continuation and conclusion of research conducted through FY 89 by G. H. Sutton and others at Rondout Associates, Inc., Stone Ridge, NY and was part of the ULF/VLF ARI to understand the ambient acoustic/seismic noisefield in the ocean as a function of location and time in the ULF (0.001 to 1Hz) and VLF (1 to 50 Hz) frequency band. The objectives of this Grant were to analyze and interpret data from the Columbia Point Arena ocean bottom seismic station (OBSS); to compare the data with available source information; and to compare the OBSS data with concurrent data from continental arrays. FAULTED STRUCTURE OF THE BOTTOM SIMULATING REFLECTOR ON THE BLAKE RIDGE, WESTERN NORTH ATLANTIC Final Report
M. M. Rowe and J. F. Gettrust Sep. 1993 5 p Repr. from Geology, v. 21, Sep. 1993 p 833-836
(AD-A271289; NRL/JA/7321-93-0008) Avail: CASI HC A01/MF A01

High-resolution multichannel seismic data collected from the Blake Ridge in the western North Atlantic by the Naval Research Laboratory's Deep Towed Acoustics/Geophysics System (DTAGS) show that the bottom simulating reflector (BSR) in this area is the reflection from the interface between an approximately 440-m-thick section of hydrate bearing sediment overlying an approximately 5-m-thick layer of methane gas-rich sediment. The high resolution attainable by the deep-tow seismic system reveals normal fault offsets of approximately 20 m in the BSR. These growth faults may provide a path for vertical migration of methane initially concentrated beneath the hydrate-bearing sediment, enabling hydrate to form throughout sediment above the BSR. Because the BSR represents a methane gas/methane hydrate phase boundary rather than a lithologic or diagenetic horizon, the observed off-set of the BSR itself reflects discontinuities in the pressure-temperature field across the fault zones where they intersect the BSR. SEISMIC STUDIES OF THE GEOLOGIC STRUCTURE AND PHYSICAL PROPERTIES OF THE SEABED Final Report
John I. Ewing 4 Oct. 1993 4 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-90-J-1817)
(AD-A270895) Avail: CASI HC A01

The purpose of these studies are the following: to determine the physical parameters that most affect low frequency acoustic propagation in shallow water areas where elastic and acoustics waves interact intimately; to develop instrumentation, field procedures, and data inversion methods for accurate measurement of shear wave speed and attenuation as functions of frequency, depth, and locations in the seabed; and to determine the effects of anisotropy and other inhomogeneities created by sedimentary processes. DTIC

MARINE-MODIFIED LOWTRAN: THE CONTRIBUTION OF SUN GLINT Final Technical Report
C. R. Zeisse Jun. 1993 48 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A269547; NRAD-TR-1611) Avail: CASI HC A03

Sun glint was added to the Atmospheric Transmittance/Radiance Computer Code LOWTRAN 6 in order to provide a more realistic representation of the infrared marine environment. The modified model's results were compared with infrared data that were taken at 3-5 microns over the open ocean during different solar elevations and wind speed conditions. A significant glint contribution was obtained at 1450 PDT on 10 October 1991. At this time, a close match between the shape of the predicted and observed radiance values in the sky and sea was noted. The absolute value of the predicted and observed radiances differed, however, by a large constant with an equivalent blackbody temperature of approximately 5 C. It was speculated that the origin of this additional radiance may be multiple scattering of solar radiation. DTIC

MEASUREMENTS OF OCEAN SURFACE AND BOTTOM BACKSCATTERING STRENGTHS IN THE NORTHWESTERN ATLANTIC OCEAN Final Report
Nolan R. Davis, Joseph Jeffrey, and Fred T. Erskine 8 Oct. 1993 59 p
(DA Proj. R03-5-B-03)
(AD-A270893; NRL/FR/7142-93-9570) Avail: CASI HC A04/MF A01

Experimental measurements of ocean surface and bottom backscattering strengths were carried out in the northwestern Atlantic Ocean during Jul. and Aug. 1990. The experiment used ship and air deployed explosive charges to provide ensonification of the ocean surface and bottom over a range of low frequencies up to 1 kHz. Overall, the surface backscatter results agreed well with the Ogden-Erskine curves, matching the predicted dependence on wind speed, grazing angle, and frequency. At two sites northeast of the Grand Banks, the surface backscattering strengths appeared to be dominated by volume backscattering caused by fish. The bottom backscattering strengths were observed to have considerable variation in level (up to 17 dB) between different sites. As a function of grazing angle, most of the bottom backscattering strength curves paralleled the Mackenzie curve for the grazing angles between 30 and 50 deg. A moderate frequency dependence of approximately 3 dB was observed. Comparisons of the bottom backscattering strengths with the Damuth 3.5 kHz echo-character province types yielded no consistent correlations. Comparisons with archival results for the same region yielded general agreement within 6 dB. Comparison of the ship-based and airborne techniques yielded comparable backscattering strengths to within 5 dB. DTIC

N94-19792# Woods Hole Oceanographic Inst., MA.
A LABORATORY MODEL OF A COOLED CONTINENTAL SHELF
J. A. Whitehead and Robert E. Frazel Jun. 1993 40 p
(Contract N00014-89-J-1037)
(AD-A270862; WHOI-93-22) Avail: CASI HC A03/MF A01

A laboratory model of wintertime cooling over a continental shelf has a water surface cooled by air in an annular rotating tank. A flat shallow outer 'continental shelf' region is next to a conical 'continental slope' bottom and a flat 'deep ocean' center. The shelf flow consists of cellular convection cells descending into a region with very complicated baroclinic eddies. Extremely pronounced fronts are found at the shelf break and over the slope. Associated with these are sizable geostrophic currents along the shelf and over shelf break contours. Eddies are particularly energetic there. The cooling rate is compared with temperature difference between 'continental shelf' and 'deep ocean'. Scaling considerations produce an empirical best fit formula for temperature difference as a function of cooling rate. This produces a relatively straight regression line over a wide range of rotation rates, shelf depths, and cooling rates. If this formula is valid for the ocean, water over continental shelves will be much colder due to constraints imposed by rotation of the earth than if the fluid were not rotating. DTIC

CELLULAR AND MOLECULAR LEVEL RESPONSES AFTER RADIOFREQUENCY RADIATION EXPOSURE, ALONE OR IN COMBINATION WITH X RAYS OR CHEMICALS Annual Technical Report, 1 Apr. 1992 - 31 Mar. 1993
Martin L. Meltz 27 Jul. 1992 94 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0206-91)
(AD-A268189; K-GAUO-00-030-102; AFOSR-93-0586TR) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The focus of the second years' activities has been to establish, for the human 244B human lymphoblastoid cell line, selected biological effects of standard dose rate ionizing radiation (over the same low total dose range as to be used for combined microwave/ionizing radiation experiments) and hyperthermia (at the same temperature as will be used in the combined studies). The endpoints which have been examined, and for which alterations have been observed after either ionizing radiation exposure or heat treatment (for different times and temperatures), include cell proliferation and viability, cell cycle distribution, cell surface membrane markers, stress protein synthesis, DNA binding protein induction (NF-kB), and proto-oncogene induction. The observation of the two latter endpoints, at low doses, was unexpected. An interaction of ionizing radiation and hyperthermia, reducing stress protein synthesis, was also unexpected. Of the final 10 surface markers examined, 4 have been identified for their potential use in detecting either ionizing radiation or hyperthermia effects. DTIC

IN VIVO ANIMAL MODELS OF BODY COMPOSITION IN AGING
S. Yasumura, K. Jones, P. Spanne, G. Schidlovsky, and L. Wielopolski 1992 7 p Presented at the Aging and Body Composition: Technological Advances and Physiological Interrelationships, Anaheim, CA, 7 Apr. 1992
(Contract DE-AC02-76CH-00016)
(DE93-012527; BNL-48787; CONF-9204244-1) Avail: CASI HC A02/MF A01

We developed several techniques that provide data on body elemental composition from in vivo measurements in rats. These methods include total body potassium by whole-body counting of endogenous K-40; total body calcium (TBCa), sodium, and chloride by in vivo neutron activation analysis; and total body phosphorus (TBP) and nitrogen (TBN) by photon activation analysis. These elements provide information on total body fat, total body protein, and skeletal mass. Measurements were made in 6-, 12- and 24-month-old rats. TBN increased slightly between 6 and 12 months but was significantly lower by 24 months, indicating a substantial loss in total body protein. Working at the National Synchrotron Light Source, we studied rat femurs by computed microtomography (CMT) and the elemental profile of the femur cortex by synchrotron-radiation induced X-ray emission (SRIXE). Although there were no significant changes in TBCa and TBP, indices of skeletal mass, CMT revealed a marked increase in the size and number of cavities in the endosteal region of the femur cortex with increasing age. The SRIXE analysis of this cortical bone revealed a parallel decrease in the endosteal Ca/P ratio. Thus, there are major alterations in bone morphology and regional elemental composition despite only modest changes in total skeletal mass. DOE

IMPROVING THE BIODEGRADATIVE CAPACITY OF SUBSURFACE BACTERIA
M. F. Romine and F. J. Brockman Apr. 1993 16 p Presented at the 2nd International Symposium In Situ and On-Site Bioreclamation, San Diego, CA, 5-8 Apr. 1993
(Contract DE-AC06-76RL-01830)
(DE93-013171; PNL-SA-21765; CONF-930482-7) Avail: CASI HC A03/MF A01

The continual release of large volumes of synthetic materials into the environment by agricultural and industrial sources over the last few decades has resulted in pollution of the subsurface environment. Cleanup has been difficult because of the relative inaccessibility of the contaminants caused by their wide dispersal in the deep subsurface, often at low concentrations and in large volumes. As a possible solution for these problems, interest in the introduction of biodegradative bacteria for in situ remediation of these sites has increased greatly in recent years (Timmis et al. 1988). Selection of biodegradative microbes to apply in such cleanup is limited to those strains that can survive among the native bacterial and predator community members at the particular pH, temperature, and moisture status of the site (Alexander, 1984). The use of microorganisms isolated from subsurface environments would be advantageous because the organisms are already adapted to the subsurface conditions. The options are further narrowed to strains that are able to degrade the contaminant rapidly, even in the presence of highly recalcitrant anthropogenic waste mixtures, and in conditions that do not require addition of further toxic compounds for the expression of the biodegradative capacity (Sayler et al. 1990). These obstacles can be overcome by placing the genes of well-characterized biodegradative enzymes under the control of promoters that can be regulated by inexpensive and nontoxic external factors and then moving the new genetic constructs into diverse groups of subsurface microbes. The objective of this research is to test this hypothesis by comparing expression of two different toluene biodegradative enzymatic pathways from two different regulatable promoters in a variety of subsurface isolates. DOE

SOMATOSENSORY RESPONSIVENESS IN BEHAVING MONKEYS AND HUMAN SUBJECTS Annual Report, 1 Jul. 1992 - 30 Jun. 1993
Randall J. Nelson 31 Jul. 1993 18 p
(Grant AF-AFOSR-0333-91)
(AD-A268924; AFOSR-93-0671TR) Avail: CASI HC A03/MF A01

Three research goals were accomplished during this second year. First, analysis of data indicated that sensory responsiveness of primary somatosensory (SI) cortical neurons that respond to vibratory go-cues for wrist movement with the greatest fidelity have their activity modulated just prior to movement onset. This observation fits with the hypothesis that prior to active movement, sensory inputs that are no longer behaviorally relevant are gated so as not to interfere with monitoring movement parameters by the primate CNS. Second, the preliminary results from the recordings from 249 task related sensorimotor cortical neurons indicate that when behavioral conditions become suddenly unpredictable, responsiveness to peripheral sensory and centrally-generated inputs is increased. This is tentatively being viewed as a release from the tonic attenuation that probably occurs during the performance of stereotypic behaviors. Finally, preliminary findings suggest that human subjects can alter wrist movements toward a positional target if vibratory abort-cues are presented early enough. Correct alterations in movement become more likely with increased practice. Final performance and the time necessary to achieve it range on the order of 4-6 days. DTIC

MATRIX- AND SUBSTRATE-ASSISTED LASER DESORPTION FOR FAST DNA SEQUENCING
C. H. Chen, S. L. Allman, K. Tang, and R. B. Jones 1993 8 p Presented at the OE/LASE 1993 International Society for Optical Engineering (SPIE) Conference, Los Angeles, CA, 16-23 Jan. 1993
(Contract DE-AC05-84OR-21400)
(DE93-015332; CONF-930159-37) Avail: CASI HC A02/MF A01

Tremendous effort has been put to achieving fast sequencing of DNA due to the potential great applications in biological and medical research. Current DNA sequencing methods were developed by Sanger and Maxam-Gilbert. Both radioactive methods and fluorescent dye labeling methods for DNA sequencing require the use of the time-consuming gel electrophoresis method. It is desirable to consider a time-of-flight mass spectrometer approach to DNA sequencing since the time needed for separation of DNA segments in a mass spectrometer is a few microseconds instead of a few hours in gel electrophoresis. However, there are two major difficulties: developing a reliable method to deliver these nonvolatile biopolymers to the mass spectrometer's ionization zone, and achieving ion production without significant fragmentation in either the desorption or ionization steps. Electrospray and laser-desorption ionization have been considered to have good potential for overcoming these difficulties. Large polypeptide molecules can be put into the gas phase and ionized by a laser in the presence of excessive amounts of nicotinic acid molecules serving as a matrix, a method called the matrix-assisted laser desorption/ionization (MALDI). Matrix-assisted UV desorption and ionization has also been applied to DNA segments; however, the success has been limited to very small segments. MALDI has been used here for detecting medium sizes of oligomers. Fast sequencing of DNA by laser mass spectrometry can possibly be achieved by discovering new matrices for efficient production of parent ions of large oligomers. Another approach is to achieve efficient post-ionization after the desorption. The first step has been taken, the success may not be very far away. DOE

PHOTOSYNTHETIC RESPONSES TO THE ENVIRONMENT, VOLUME 8 Final Report

Harry Y. Yamamoto and Celia M. Smith 27 Aug. 1992 263 p Presented at the Proceedings Symposium, Manoa, HI, 24-27 Aug. 1992 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-92-J-1523)
(AD-A269584) Avail: CASI HC A12

Certain fundamental differences separate marine, aquatic, and terrestrial plants as obviously as the difference in physical factors among their habitats. Yet at the core of their responses to environmental factors, photosynthesis ties these entities together in ways not typically seen in scientific meetings or collaboration among researchers. It was our optimistic intent in organizing this meeting 'Photosynthetic Responses to the Environment' to try to bridge these diverse groups of plant life and scientists by bringing together leaders, researchers, and young scientists for three days of in-depth discussions that could refresh us with new appreciation, new ideas, and new colleagues. THE c-JUN GENE EXPRESSION IN HUMAN CELLS EXPOSED TO EITHER IONIZING RADIATION OR HYDROGEN PEROXIDE

F. R. Collart, M. Horio, and E. Huberman Jun. 1993 6 p Presented at the International Seminar on Molecular Mechanisms in Radiation Mutagenesis and Carcinogenesis, Doorwerth, Netherlands, 19-22 Apr. 1993
(Contract W-31-109-eng-38)
(DE93-017436; ANL/CBM/CP-80231; CONF-930454-3) Avail: CASI HC A02/MF A01

We investigated the role of reactive oxygen intermediates (ROI's) and protein kinase C (PKC) in radiation- and H2O2-evoked c-jun gene expression in human HL-205 cells. This induction of c-jun gene expression could be prevented by pretreatment of the cells with Nacetylcysteine (an antioxidant) or H7 (a PKC and PKA inhibitor) but not by HA1004, a PKA inhibitor, suggesting a role for ROIs and PKC in mediating c-jun gene expression. We also investigated potential differences in c-jun gene expression in a panel of normal and tumor cells untreated or treated with ionizing radiation or H2O2. Treatment with radiation or H2O2 produced a varied response, from some reduction to an increase of more than an order of magnitude in the steady-state level of c-jun mRNA. These data indicate that although induction of c-jun may be a common response to ionizing radiation and H2O2, this response was reduced or absent in some cell types. DOE

THE ROLE OF CHEMICAL INHIBITION OF GAP JUNCTIONAL INTERCELLULAR COMMUNICATION IN TOXICOLOGY Annual Report, 15 May 1992 - 14 May 1993

James E. Trosko and Burra V. Madhukar 19 May 1993 15 p
(Contract F49620-92-J-0293; AF Proj. 2312)
(AD-A269251; AFOSR-93-0675TR) Avail: CASI HC A03/MF A01

Progress during this past grant period has continued to mount, with new findings, new techniques to achieve our aims and objectives, and new support for our original working hypothesis that chemical modulation of gap junctional intercellular communication (GJIC) is involved in multiple formats of toxicity. We now have evidence on how certain tumor promoting chemicals, neurotoxicants, reproductive toxicants, teratogens, or immunotoxicants can affect GJIC at either the transcriptional, translational, or posttranslational levels. Using cells mutated for altered GJIC; transfected with various oncogenes; or treated with different kinds of chemical toxicants, We have now elucidated the different mechanisms by which GJIC can be effected. This new mechanistic understanding should contribute to a more biologically-based risk assessment model and an understanding of how epigenetic toxicants work. DTIC

SPACE LIFE SCIENCES RESEARCH: THE IMPORTANCE OF LONG-TERM SPACE EXPERIMENTS

Oct. 1993 43 p Prepared in cooperation with George Washington Univ., Washington, DC
(NASA-TM-4502; NAS 1.15:4502) Avail: CASI HC A03/MF A01

This report focuses on the scientific importance of long-term space experiments for the advancement of biological science and the benefit of humankind. It includes a collection of papers that explore the scientific potential provided by the capability to manipulate organisms by removing a force that has been instrumental in the evolution and development of all organisms. Further, it provides the scientific justification for why the long-term space exposure that can be provided by a space station is essential to conduct significant research. For individual titles, see N94-19211 through N94-19217.

THE RATIONALE FOR FUNDAMENTAL RESEARCH IN SPACE BIOLOGY: INTRODUCTION AND BACKGROUND

Thora W. Halstead and Robert W. Krauss *In its* Space Life Sciences Research: The Importance of Long-Term Space Experiments Oct. 1993 p 1-2 (For primary document see N94-19210 04-51)
Avail: CASI HC A01/MF A01

With the construction of Space Station Freedom, NASA will have available a new platform for experiments in space that promises many advantages over those already flown. Biologists are poised to take advantage of the greater space, the increased power, and especially the long duration of the station for a cascade of innovative experiments in fundamental science that are long overdue. The unique space environment will provide new dimensions for approaching some of the most challenging problems still facing modern biology. Solutions to basic questions about living systems, which may now be grown through many generations in space, will not only explain abnormalities already observed there, but will add to our understanding of how life functions on Earth. Much will be learned about evolution that has built us the way we are, but also about what it has in store for the Earth's species in the future. NASA must not lose this opportunity to contribute to the welfare of the peoples of the Earth while at the same time create knowledge that will enable human exploration of space in the decades ahead. SPACE RESEARCH WITH INTACT ORGANISMS: THE ROLE OF SPACE STATION FREEDOM

Robert W. Phillips and Francis J. Haddy (Uniformed Services Univ. of the

Health Sciences, Bethesda, MD.) *In its* Space Life Sciences Research: The Importance of Long-Term Space Experiments Oct. 1993 p 7-12 (For primary document see N94-19210 04-51)
Avail: CASI HC A02/MF A01

The study of intact organisms has provided biologists with a good working knowledge of most of the common organisms that have evolved in the 1 g environment of Earth. Reasonably accurate predictions can be made about organismal responses to most stimuli on Earth. To extend this knowledge to life without gravity, we must have access to the space environment for prolonged periods. Space Station Freedom will provide a facility with which to begin this type of research. Spaceflight research to date has been limited to relatively short-term exposures that have been informative but incomplete. This paper provides a brief background of known changes that have occurred in intact organisms in the space environment and proposes the kinds of experiments that are needed to expand our knowledge of life on Earth and in space. SPACE RESEARCH ON ORGANS AND TISSUES
Marc E. Tischler and Emily Morey-Holton (National Aeronautics and Space Administration. Ames Research Center, Moffett Field, CA.) *In* NASA. Headquarters, Space Life Sciences Research: The Importance of Long-Term Space Experiments Washington Oct. 1993 p 13-20 (For primary document see N94-19210 04-51)
Avail: CASI HC A02/MF A01

Studies in space on various physiological systems have and will continue to provide valuable information on how they adapt to reduced gravitational conditions, and how living in a 1 g (gravity) environment has guided their development. Muscle and bone are the most notable tissues that respond to unweighting caused by lack of gravity. The function of specific muscles and bones relates directly to mechanical loading, so that removal of 'normal forces' in space, or in bedridden patients, causes dramatic loss of tissue mass. The cardiovascular system is also markedly affected by reduced gravity. Adaptation includes decreased blood flow to the lower extremities, thus decreasing the heart output requirement. Return to 1 g is associated with a period of reconditioning due to the deconditioning that occurs in space. Changes in the cardiovascular system are also related to responses of the kidney and certain endocrine (hormone-producing) organs. Changes in respiratory function may also occur, suggesting an effect on the lungs, though this adaptation is poorly understood. The neurovestibular system, including the brain and organs of the inner ear, must adapt to the disorientation caused by lack of gravity. Preliminary findings have been reported for liver. Additionally, endocrine organs responsible for release of hormones such as insulin, growth hormone, glucocorticoids, and thyroid hormone may respond to spaceflight. Author

MICROGRAVITY RESEARCH IN PLANT BIOLOGICAL SYSTEMS: REALIZING THE POTENTIAL OF MOLECULAR BIOLOGY
Norman G. Lewis and Clarence A. Ryan *In* NASA. Headquarters, Space Life Sciences Research: The Importance of Long-Term Space Experiments Washington Oct. 1993 p 31-34 (For primary document see N94-19210 04-51)
Avail: CASI HC A01/MF A01

The sole all-pervasive feature of the environment that has helped shape, through evolution, all life on Earth is gravity. The near weightlessness of the Space Station Freedom space environment allows gravitational effects to be essentially uncoupled, thus providing an unprecedented opportunity to manipulate, systematically dissect, study, and exploit the role of gravity in the growth and development of all life forms. New and exciting opportunities are now available to utilize molecular biological and biochemical approaches to study the effects of microgravity on living organisms. By careful experimentation, we can determine how gravity perception occurs, how the resulting signals are produced and transduced, and how or if tissue-specific differences in gene expression occur. Microgravity research can provide unique new approaches to further our basic understanding of development and metabolic processes of cells and organisms, and to further the application of this new knowledge for the betterment of humankind. LIFE: ORIGIN AND EVOLUTION ON EARTH--HOW CAN WE ESCAPE?
Clement L. Markert and Abraham D. Krikorian (State Univ. of New York, Stony Brook.) *In* NASA. Headquarters, Space Life Sciences Research: The Importance of Long-Term Space Experiments Washington Oct. 1993 p 35-39 (For primary document see N94-19210 04-51)
Avail: CASI HC A01/MF A01

Exploitation of gene regulation rather than the creation of new genes has been predominantly responsible for the evolutionary advances in animals and plants that are widely recognized today. Until very recently it was not possible to examine life in the absence of gravity. We can now imagine forms of life in the universe adapting to circumstances different from those found on Earth. Our own life forms would surely become different in time if they were transferred to other planets with different conditions, including much lower or higher gravity. Author

PHOTOSYNTHETIC REACTION CENTERS AS ACTIVE MOLECULAR ELECTRONIC COMPONENTS, PHASE 1 Final Report, 15 Jan. - 14 Jul. 1993
Albert F. Lawrence 13 Aug. 1993 51 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DAAH04-93-C-0003)
(AD-A271388; ARO-30818.1-CH-SBI-Phase-1) Avail: CASI HC A04

The aim of this project is the development of reaction centers from photosynthetic bacteria for use in molecule-based components and devices. Reaction centers (RC's) exhibit a highly efficient, rapid, long-distance photoinduced charge separation under a wide variety of conditions. The reaction center has electronic properties which are far superior, more flexible, and much less expensive to produce than any known synthetic donor/acceptor system. During the course of this project the author developed strategies for the attachment of reaction centers to electrode surfaces, and demonstrated the first steps in this process. The approach employed molecular modeling, site-directed mutagenesis, and the attachment of dye molecules to a particular RC site. Correlated developments include refinement and simplification of the process for preparing reaction centers, studies of materials issues, studies of device concepts, and transfer of RC preparation techniques to Biological Components Corporation. A STUDY OF THE EFFECT OF HYDROCARBON STRUCTURE ON THE INDUCTION OF MALE RAT NEPHROPATHY AND METABOLIC STRUCTURE Final Report, 1 Jun. 1989 - 31 Aug. 1993
M. P. Serve 31 Aug. 1993 64 p
(Grant AF-AFOSR-0396-89)
(AD-A270969; AFOSR-93-0751TR) Avail: CASI HC A04/MF A01

Certain hydrocarbons were shown to cause nephrotoxicity in male rats. Since many of the hydrocarbons have a branched alkyl side chain, several isomers of octane including 2,5-dimethylhexane, 2-methylheptane, 3-methylheptane, and 4-methylheptane were evaluated on their ability to induce the nephrotoxicity. Since the above hydrocarbons are components of fuels and solvents, an investigation into their pathways of metabolism was undertaken in order to see if a pattern of biotransformation could be deduced and determined if potentially harmful metabolites were produced. Male 344 Fischer rats were dosed intragastrically with the above hydrocarbons over a 14 day period. When compared with rats, the order of mephrotoxicity was determined. DTIC

We have explored the possibility of measuring urinary radioactivity as an index of pancreatic lipase activity after oral administration of a new triglyceride containing a radioactive iodine-1 25-labeled fatty acid moiety. The new agent, 1,2-dipalmitoyl- 3(15- (p-iodophenyl) pentandecan-1-oyl)-racglycerol (1,2-Pal-3-IPPA), was prepared by the thallation-iodide displacement method. Following oral gavage of the radioiodinated triglyceride to rats, about 30% of the administered activity was excreted in 24 hours in the urine. In normal human controls a higher urinary excretion (of about 75%) was observed. In this report, we describe an evaluation of the metabolites excreted in the urine and the chemical species stored in adipose from rats. The urine activity co-chromatographed with hippuric acid by TLC indicating conjugation of the IPPA metabolites. Release of the acidic components from the conjugated excretory products by acid hydrolysis of the urine provided the radioactive acidic IPPA metabolites. Analysis of the Folch extracts of fat samples from rats demonstrated that the radioactive components co-chromatographed in the triglyceride region. Recent studies in patients with compromised pancreatic exocrine function have demonstrated significantly decreased 24 hr. urinary excretion of about 25%, following oral administration of (1-131)- 1,2-Pal-3-IPPA. Thus, urine analysis after oral administration of (1-131)- 1,2-Pal-3-IPPA may be a simple, non-invasive tool for the clinical evaluation of various diseases involving dietary fat digestion. DOE

EFFECTS OF A HIGH-ENERGY FOOD SUPPLEMENT ON COLD-INDUCED THERMOGENESIS
A. L. Vallerand and I. Jacobs Aug. 1993 29 p
(AD-A269301; DCIEM-93-36) Avail: CASI HC A03/MF A01

In previous studies, we have not been able to confirm the theory that energy substrate mobilization is a limiting factor for cold-induced thermogenesis (M) in humans. One possible explanation for the conflicting results is that the dose of energy substrates may not have been optimal. The goal of this study was to determine whether the ingestion of a high-energy food supplement (710 kcal or 2,970 kJ; Ensure Pulse) in the cold could alter: (1) M, (2) heat balance (min by min determination of heat debt (S) where S = M - heat losses, (3) rectal (T sub re) and (4) mean skin temperatures (T sub sk), (5) rates of substrate oxidation, and (6) plasma levels of substrates and hormones, taken as indices of substrate mobilization. Seven healthy males were subjected to two semi-nude cold exposure tests (3h at 7 C, 1 m/.s wind, fasting, tests performed 1 wk apart). The ingestion of a high-energy supplement did not influence either T sub re, T sub sk, m, or S in comparison to the placebo test in the same subjects. This absence of changes was observed even though the supplement elevated carbohydrate mobilization and oxidation (P less than 0.05), albeit at the expense of lipid mobilization and oxidation (P less than 0.05). The present results demonstrate that the ingestion of a food supplement that enhances energy substrate mobilization and oxidation does not alter cold thermogenesis, heat debt or body temperatures in humans, under normal conditions. USING CONTROLLED DAYLIGHT EXPOSURE AND SLEEP TIMING IN THE PREVENTION OF SHIFT LAG DURING NIGHT OPERATIONS Technical Report
Carlos A. Comperatore Jun. 1993 37 p
(AD-A269304; USAARL-93-25) Avail: CASI HC A03/MF A01

In the Army aviation community, a significant component of combat and training missions is night operations. Mission requirements often necessitate an initial shift from daytime to nighttime duty hours within 24 to 48 hours. Rapid shifts from daytime to nighttime work, and nighttime to daytime sleep usually result in loss of sleep, degradation of alertness, increased fatigue, and reduced work effectiveness. These symptoms are referred to as 'shift-lag' because the body's physiological adjustment lags behind the rapid shift to the new work schedule. Research on shiftwork provides a variety of approaches to avoid the deterioration of performance and health of shiftworkers. Shift-lag prevention plans may consider the speed of shiftwork rotation, the duration of each shift, age of workers, physical strength associated with work demands, diet, timing of sleep, and in some cases, the use of drugs to induce sleep and attempt to resynchronize the body's internal biological clock. However, the use of controlled timing of daylight exposure and of sleep schedules are of overriding importance. In the Army aviation context, consequences of shifts to nocturnal work schedules without the implementation of a shift-lag prevention plan have been recently documented. This work reviews the mechanism of biological timing in humans, the role of environmental lighting, and specifically identifies methods of preventing sleep loss and fatigue during the transition from daytime to nighttime duty hours. SYNCHRONISATION OF COLD INDUCED VASODILATION AT VARIOUS LOCATIONS OF ONE HAND Final Report
H. A. M. Daanen and W. A. Lotens 6 Jul. 1992 22 p Sponsored by TNO Defence Research, Delft, Netherlands
(IZF-1992-B3; TD92-0258; ETN-93-94526) Copyright Avail: TNO Institute for Perception, Kampweg 5, 3769 ZG Soesterberg, Netherlands

The amount of correspondence between the Cold Induced Vasodilation (CIVD) responses in several sites of the left hand is quantified by the Pearson Correlation Coefficient (PCC) of the local skin temperatures. A PCC of zero means that all registrations are independent, indicating a purely local mechanism. A PCC approaching 1 indicates an increasing central component. Twelve subjects immersed their left hands in a calorimeter water bath of 5 C. All PCC's of the fingers and the ventral and dorsal side of the hand were calculated. A period of 30 minutes was analyzed, starting 10 minutes after immersion. The PCC was higher for neighboring fingers (PCC = 0.67) than for fingers separated by other fingers (PCC = 0.48). For neighboring fingers those mainly innervated by the same somatic nerve (ring-little and index-middle finger) had a higher PCC (PCC = 0.80) than for the fingers with more separate innervation (PCC = 0.55). The PCC between the two locations on the hands and the fingers were insignificant. It is concluded that the CIVD of the fingers shows so much correspondence that a central component is clearly presented. From the difference in PCC between neighboring and other fingers it can be seen that local mechanisms also determine the CIVD characteristics. Theories based on nervous involvement are supported by the finding that shared somatic innervation enhances the PCC. ESA

CONTROL OF SHOULDER MUSCLES DURING GOAL DIRECTED MOVEMENTS

R. Happee 1992 190 p
(PB93-195139; ISBN-90-370-0077-0) Copyright Avail: CASI HC A09/MF A02

The control of shoulder muscles during goal directed movements has been studied experimentally and by simulations. Muscular activity was assessed experimentally by measuring electromyographic (EMG) activity. In the EMG of maximally fast movements, triphasic activity comparable to activity reported in other joints was found. The agonist activity in the first phase causes acceleration of the limb. The antagonist activity in the second phase serves to decelerate the limb. In a simulation study it was shown that the third phase contributes to a time optimal movement. The role of the third phase is shown to be related to muscle dynamics. A model has been developed which gives an accurate description of movement kinematics and which is based on interpretable parameters. Four parameters describe the timing of a triphasic muscular input and a fifth parameter describes neuromuscular dynamics. The parameters provide a means to compare the shape of movement traces under different experimental conditions. After scaling towards the movement velocity, these parameters revealed a significant dependence on the movement direction and the maximum velocity obtained by the subjects. NTIS

(AD-A268795; AFOSR-93-0635TR) Avail: CASI HC A01

We measured the temporal dynamics of relative motion judgement. Two lines or dots oscillated either in the same phase of motion, or in 180 phase relative to each other. Subjects were required to discriminate between the two kinds of motion. The dots either oscillated vertically or horizontally. The former case produced oscillating orientation and the later case produced oscillating separation. The temporal frequency of oscillation was varied (presented at OSA-1992). In experiments with lines, the separation of the lines was varied while the distance of the lines from the fovea was held constant. The discriminability of two different phases of relative motion was measured and compared to the detectability of these motions. The physchometric transducer functions were measured and plotted. US ARMY AVIATION EPIDEMIOLOGY DATA REGISTER: PREVALENCE OF REFRACTIVE ERROR AMONG US AIRCREW MEMBERS Final Report
Kevin T. Mason, S. C. Shannon, and Robert H. Schrimsher Jun. 1993 30 p
(DA Proj. 3M1-62787-A-879)
(AD-A269550; USAARL-93-24) Avail: CASI HC A03/MF A01

The U.S. Army aviation branch is making final funding and planning decisions on the fielding of a contact lens program for Army aircrew members. This report stratifies the prevalence of refractive error by aviation duty position, service component, and rank. There is an increasing prevalence of refractive error in the higher ranking aircrew members, paralleling increasing age with rank promotion. Comparing service components, the prevalence is higher in the reserve component and civilian forces than active duty forces. Within the aviator service component cohorts, there has been a significant upward trend in the annual period prevalence of refractive error from 1986 through 1992, especially in the Army Reserve and National Guard cohorts. This upward trend may be related to the observed upward trend in the average age of Army aircrew members as a group from 1986 through 1990. DTIC

REVIEW OF SHORT-TERM, HIGH-LEVEL EXPOSURE TO METALS: ANTIMONY, BARIUM, AND CADMIUM Technical Report, Sep. 1992 - Jun. 1993
James C. Eaton 16 Jun. 1993 25 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DAMD17-93-C-3006; DA Proj. 3M1-62787-A-878)
(AD-A268896; USABRDL-TR-9303) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The adverse health effects of inhaling the metals antimony, barium, and cadmium which are components of exhaust from military weapons systems have been reviewed. The metals antimony and cadmium are suspected carcinogens. In addition, cadmium at chronic low level has been implicated in kidney dysfunction. There are no documented exposures of Army personnel to the high levels that would result in severe acute effects. Since the chronic effects of these three metals are cumulative, the 8-hour time-weighted average exposure is the proper mechanism for regulating episodic short-term exposures to them at moderately high levels. The report recommends that the Army adhere to the established Federal workplace exposure limits for the three metals and that exposure to antimony and cadmium, the two metals with demonstrated carcinogenic activity, be reduced to a level as low as is reasonably achievable. [THE IDENTIFICATION OF THE COMPUTATIONAL SIGNIFICANCE OF KEY NEUROBIOLOGICAL CHARACTERISTICS FOUND IN A NUMBER OF TELENCEPHALIC BRAIN REGIONS] Final Technical Report
Gary Lynch and Richard Granger 1993 7 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-89-J-3179)
(AD-A269374) Avail: CASI HC A02

The funded research has had as its primary goal the identification of the computational significance of key neurobiological characteristics found in a number of telencephalic brain regions. Recent findings have identified novel, computationally valuable algorithms derived from simulation and analysis of specific brain networks, including the olfactory system and the hippocampus as well as auditory neocortex. Analysis has shown that, as might be expected from networks faced with demanding signal-processing tasks under limited-resource situations, these brain-based algorithms have very efficient time and space complexity characteristics and are directly applicable to signal processing tasks of known difficulty, including processing of complex time-varying signals such as speech and sonar. INTRACELLULAR PHYSIOLOGY OF THE RAT SUPRACHIASMATIC NUCLEUS: ELECTRICAL PROPERTIES, NEUROTRANSMISSION AND EFFECTS OF NEUROMODULATORS Final Report, 15 Jul. 1992 - 14 Jul. 1993
F. E. Dudek 30 Apr. 1993 13 p
(Contract F49620-92-J-0417)
(AD-A268829) Avail: CASI HC A03/MF A01

Knowledge of the neuronal membrane properties and synaptic physiology of the suprachiasmatic nucleus (SCN) is critical for an understanding of the cellular basis of circadian rhythms in mammals. The hypothalamic slice preparation from rodents and a combination of electrophysiological techniques (i.e., extracellular single- and multiple-unit recording, intracellular recording, and whole-cell patch clamp) were used to study the following: (1) the role of excitatory and inhibitory amino acids (i.e., glutamate and GABA) in synaptic transmission; (2) the membrane properties of SCN neurons; and (3) the mechanisms of neuronal synchronization. Antagonists for N-methyl-D-aspartate (NMDA) and non-NMDA receptors blocked excitatory postsynaptic potentials (EPSPs) evoked by stimulation of the optic nerve other sites when SCN cells were depolarized or at rest, respectively. Bicuculline blocked inhibitory postsynaptic potentials (IPSP's) that were evoked by local stimulation or that occurred spontaneously. The IPSP reversal potential was near the Cl(-) equilibrium potential and was shifted to depolarized levels by raising intracellular Cl(-). Thus, glutamate and GABA appear to mediate fast excitatory inhibitory synaptic transmission in the SCN. Some SCN neurons, but not all of them, have low-threshold Ca(2+) spikes and time-dependent inward rectification, thus indicating that the electrical properties of SCN neurons are not homogenous. Neurons with a firing rate greater than 6 Hz had a regular pattern, and neurons with a rate less than 4 Hz had an irregular pattern; since both the firing rate and pattern could be modified with injected currents, SCN neurons with different firing patterns are unlikely to represent distinct classes of cells. METABOLIC CHANGES AND HEMODYNAMIC DYSFUNCTION FOLLOWING HYPOTHERMIC SHOCK Final Technical Report
Harvey I. Miller 30 Jun. 1993 20 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-89-J-3124)
(AD-A269780; WES/TR/HL-93-10) Avail: CASI HC A03

The results of the metabolic studies suggest that while there are very large increases in circulating catecholamines, the catecholamines were less sensitive in the hypothermic animals after rewarm. Heart rate was elevated almost immediately upon immersion in cold water and did not fall until 2 minutes after immersion. When the BT returned to normal (0 time) so did the heart rate, even though the catecholamine levels were very high. It would appear that the adrenergic receptors are down-regulated and seemed less sensitive. This may be the reason for lack of elevation of the FFA. However another explanation maybe the 'Adipose Tissue Electronic Blanket Theory'. The changes we observed in the metabolic samples (FFA, glucose and lactate) are related to the elevation of NorEpi. When the energy bearing metabolites cannot be mobilized by catecholamines due to down-regulation and, the futile cycle of triglycerides within the adipose tissue does not produce the heat required, then the organism can no longer thermoregulate appropriately. DTIC

EVALUATION OF PHYSIOLOGICAL AND PSYCHOLOGICAL IMPAIRMENT OF HUMAN PERFORMANCE IN COLD STRESSED SUBJECTS Final Report, 9 May 1988 - 8 May 1992
Lorentz E. Wittmers and Richard Hoffman 5 Jun. 1993 183 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DAMD17-88-C-8054; DA Proj. 3O1-62787-A-879)
(AD-A268637) Avail: CASI HC A09

The effects of 2 shiver suppression techniques on performance of military relevant motor tasks, body heat conservation, and metabolic functions during cold exposure were investigated using a repeated measures MANOVA design. Nine male volunteers, 24.3 + or - 0.8 yr, were exposed for 3 hours to 3 conditions: (1) warm W = 21 deg C air; (2) Cold C = -7 deg C air; and (3) Shiver suppression (SS)= -7 deg C air with shiver suppression techniques (breath holding and voluntary relaxation) applied. Motor speed and accuracy tasks included rifle and pistol shooting and reloading, magazine reloading. Rectal temperature decreased more during SS than in W or C. Skin temperatures and temperature perceptions in C and SS declined more than W, but were similar to each other. Heart rate decreased in W and increased in C and SS. Performance on motor tasks showed decrement's with both C and SS. Decrements in rifle reloading and pistol reloading were less in SS than in C. Decrements in rifle and pistol shooting performance were greater in SS than in C. Decrements in magazine loading were not significantly different in SS and C. In conclusion, SS caused a decline in core temperature, and an improvement in cold exposure performance in simple repetative motor tasks involving little concentration, but a decrement in performance in tasks which required more mental concentration. COUPLED NEURAL-DENDRITIC PROCESSES: COOPERATIVE STOCHASTIC EFFECTS AND THE ANALYSIS OF SPIKE TRAINS
A. R. Bulsara and A. J. Maren May 1993 14 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A270041) Avail: CASI HC A03

We can create a richer and more neurophysiologically realistic model of neural activity in the brain by developing a model of neural-dendritic coupling, one which expressly accounts for the way in which the many afferent connections into the neural body influence the somatic membrane potential. Such a model would begin to fill the need within the Artificial Neural Network community for neural models which go beyond the current weighted sum paradigm for artificial neuron connectivity. Although such models have use in engineering applications, there are many aspects of biological neural-dendritic organization which could enrich artificial neural networks. Moving from simple axonal connection weight neural models to neural-dendritic models with a richer structure will allow investigation of both events at the neural level (e.g., inter-spike interval histograms and stochastic resonance) and also potentially at the neural systems level. This will also introduce the possibility of introducing cross-scale interactions into artificial neural systems. DTIC

STRATEGIES FOR ENHANCING CATECHOLAMINE-MEDIATED NEUROTRANSMISSION Final Technical Report
Richard J. Wurtman 22 Sep. 1992 4 p
(Grant NAG2-210)
(NASA-CR-193807; NAS 1.26:193807) Avail: CASI HC A01/MF A01

Major findings made during this project period included the following observations: changes in tyrosine availability do affect brain dopamine release, as assessed by in vivo microdialysis, but that neuronal feedback mechanisms limit the durations of this effect except when dopaminergic neurotransmission has been deficient; the circulating hormone TRH markedly stimulates brain dopamine release, an effect probably mediated by its diketopiperazine metabolite; the amount of circulating L-dopa which enters the brain is both enhanced by carbohydrate consumption and suppressed by protein intake (both nutritional effects can be damaging, inasmuch as a sudden rush of L-dopa into the brain can facilitate dyskinesias, while the inhibition of brain L-dopa uptake by proteins suppresses its conversion to brain dopamine; an appropriate mixture of dietary proteins and carbohydrates can obviate both effects); serotonin release from superfused hypothalamic slices is a linear function of available tryptophan levels throughout the normal dynamic range; the daily rhythm in plasma melatonin levels is abnormal both in the sudden infant death syndrome and in women with secondary amenorrhea; tyrosine can potentiate the anorectic effects of widely-used sympathomimetic drugs; newly-described COMT inhibitors can enhance brain dopamine release in vivo; and a cell culture system, based on Y-79 (retinoblast) cells, exists in which melatonin reliably suppresses dopamine release. THE EFFECTS OF REVERBERANT IMPULSE NOISE (BLAST WAVES) ON HEARING: PARAMETRIC STUDIES Midterm Report, 9 Sep. 1991 - 8 Mar. 1993
Roger P. Hamernik 16 Jun. 1993 93 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DAMD17-91-C-1113)
(AD-A269242) Avail: CASI HC A05

This research is directed at studying the effects on the auditory system of exposure to high levels of reverberant impulse noise using an animal (chinchilla) model. The blast waves were generated by a three inch diameter shock tube (source III), which produced wave signatures having spectral energy concentrated in the 12 kHz region. The waves were discharged into a reverberant chamber within which animals were individually exposed.

Animals were exposed to either 150, 155, or 160 dB peak SPL impulses. The number of impulses presented at each intensity was 1, 10, or 100, with repetition rates fixed at 1 impulse/sec. This parametric design yielded 9 groups of animals. There were 15 animals in each group. Brainstem evoked potentials were used to estimate temporary and permanent threshold shifts and conventional surface preparations of the cochlea were used to quantitatively assess sensory cell loss. This midterm report presents the audiometric data and a portion of the histological data for the 136 animals that completed the exposure protocol. The audiometric and available histological data showed that damage to the auditory system systematically increased as the energy of the exposure was increased through manipulation of number of presentations or peak SPL. THE BRAIN ELECTRICAL ACTIVITY IN DIFFERENT G SITUATIONS
K. deMetz (Antwerp Univ., Belgium.), O. Quadens (Antwerp Univ., Belgium.), and M. DeGraeve 1993 19 p Submitted for publication Sponsored in part by National Foundation for Scientific Research, Belgium
(Aeronautica-Acta-A-372-1993; ETN-93-94964) Copyright Avail: Issuing Activity (Institut d'Aeronomie Spatiale de Belgique, 3 Avenue Circulaire, B-1180 Brussels, Belgium)

The electrical activity of the brain was recorded during parabolic flights in trained astronauts and nontrained volunteers. It was quantified with the fast Fourier transform method. The electrical activity of the brain analyses evidenced more asymmetry between the two brain hemispheres in the subject who suffered from motion sickness than in the others. A first attempt was made to calculate the dimensionality of 'chaotic attractors' in the electrical activity of the brain patterns as a function of the different g-epochs of 1 parabola. This method allows us to discriminate between deterministic and stochastic events and to indicate trends. Preliminary results are given. ESA

A COMPARISON OF POLYGRAPHIC AND ACTIGRAPHIC MONITORING OF SLEEP USING A 5-CHANNEL PROGRAMMABLE-SENSITIVITY ACTIGRAPH Final Report, 15 Nov 1990 - 14 Nov. 1992
Timothy F. Elsmore and Paul Naitoh 30 Nov. 1992 62 p
(Contract MIPR-91MM1505)
(AD-A270731) Avail: CASI HC A04/MF A01

The purpose of this project was to investigate the utility of a new device, the AMA-32 actigraph, for monitoring the general activity of human subjects both during sleep and wake. In the first phase of the project, a software program for the analysis of AMA-32 data files was developed. In the second phase, the effects of frequency passband and threshold settings of the AMA-32 amplifier were examined in a 96-hour study. It was concluded that discrimination of sleep from wake was best with the 2-3 Hz passband, which emulates earlier-generation actigraphs, and that existing algorithms for automatic sleep scoring of actigraphs are not applicable to actigraph data collected with non-traditional analog amplifier characteristics. Additional studies are needed to further explore the utility of the additional features offered by the AMA-32. DTIC

Cerebral injury, whether due to cardiac arrest, stroke, air embolism, head trauma, asphyxiation or cerebral edema, is a major medical challenge. The understanding of the basic physiology and biochemistry of brain damage helps lay a foundation for informed diagnosis and treatment, as well as the development of future intervention and treatment strategies. It is hoped that the review provides a useful collection of facts and concepts that can be integrated into a working understanding of brain injury induced by a compromised oxygen supply. This review is the result of an extensive literature search and compilation of information on ischemia and reperfusion injury. This information was used, in part, for the preparation and construction of a research preproposal on the same subject matter. DTIC

EXTRATHALAMIC MODULATION OF CORTICAL FUNCTION Final Technical Report, 1 Jul. 1990 - 30 Jun. 1993
Stephen L. Foote and Jaime A. Pineda 15 Sep. 1993 12 p
(Grant AF-AFOSR-0325-90)
(AD-A270869; AFOSR-93-0784TR) Avail: CASI HC A03/MF A01

The overall goal of the proposed study is to characterize the effects of noradrenergic (NA) afferents on cortical information processing. Our previous studies indicate that the primate locus coeruleus (LC) system, originating in the pontine brainstem, innervates the neocortex more densely than previously thought, exhibiting highly specific patterns in terms of the regional and laminar distribution of its axons across the neocortex. Previous neurophysiological observations suggest that this highly divergent system imposes state-related modulatory effects on thalamo-cortical and cortico-cortical systems. For example, we have shown that primate LC-NA neurons are more active during waking than sleep and exhibit bursts of activity during increases in attentiveness. We have also previously demonstrated that the microiontophoretic application of NA to monkey auditory cortex neurons increases the selectiveness of their responses to auditory stimuli. DTIC

A METHOD FOR COGNITIVE TASK ANALYSIS Final Report
A. M. Schaafstal and J. M. C. Schraagen 24 Jul. 1992 39 p Sponsored by TNO Defence Research, Delft, Netherlands
(IZF-1992-B5; TD92-2278; ETN-93-94527) Copyright Avail: TNO Institute for Perception, Kampweg 5, 3769 ZG Soesterberg, Netherlands

A method for cognitive task analysis based on the notion of 'generic tasks' is described. The method distinguishes three layers of analysis. At the first layer, the task structure, top level goals of a certain task that have to be fulfilled during task execution are identified. The task structure may also be viewed as the global strategy to carry out the task. At the second layer of analysis, the local strategies (procedures) are identified by means of which values are obtained for goals in the task structure. The third layer of analysis consists of a description of the underlying domain knowledge. The potentialities of the task model in predicting and diagnosing human cognitive behavior are discussed, and implications of the model for applied areas such as the development of knowledge based systems and training, are considered. Four lines of experimentation have been carried out. In the first set of experiments, we have tested and rejected a two-process model of visual attention allocation. The PI has proposed an alternative perceptual sampling model and performed stochastic simulations of the model to show that it can account for certain aspects of human performance in cued visual search tasks. In the second and third set of experiments, the PI has found that a common mechanism may underlie the perception of bistable apparent motion and the capture of visual attention in certain visual search tasks. In particular, the appearance of a new perceptual object in the visual field captures attention and this may influence how object identity is assigned in apparent motion perception. In the final set of experiments, the PI has examined the possible influence of factors influencing figural identity on the perception of bistable apparent motion. Preliminary results suggest that grouping by spatial proximity can modulate the assignment of motion correspondence in apparent motion perception. DTIC

CORTICAL SUBSTRATE OF HAPTIC REPRESENTATION Final Report
24 Aug. 1993 9 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-89-J-1805)
(AD-A269583) Avail: CASI HC A02

The focus of the research has been on the role and mechanisms of memory in motor control. Based on experience and data from primates, computational models of short-term active memory have been developed. Such models may have technological interest and applications because this kind of memory is an essential feature of any motor control system, biological or mechanical. It appears that the neurally based and neurally testable modeling of the function of memory networks is unique among ONR-sponsored programs. Laboratory research led to the discovery of memory cells in the cerebral cortex of the monkey. Over a period of several years, extensive studies of neuronal activity and reversible cryogenic inactivation in monkeys performing memory tasks have provided theoretical framework of perceptual memory. Within that framework, memory cells are the constituents of widely distributed cortical networks which, by mechanisms yet unknown, are activated above certain thresholds and kept active, for seconds or minutes, to retain information for prospective motor action. (AD-A268711; AFOSR-93-0626TR) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Research during the year has been divided between studies at USC (Biederman and students) and Minnesota. Our research continues to focus on linking early sensory representations to higher-level perceptual representations. For this reason, we refer to our Center informally as the 'Middle Kingdom'. Studies outlined below have examined the sensory/perceptual 'middle ground' in object recognition, depth perception, reading acuity, and auditory perception. Several of our studies have used ideal-observer analysis. The ideal-observer approach provides a means for quantifying the information available to perception and for evaluating the effectiveness with which humans use that information. DTIC

COMPARING PERFORMANCE ON IMPLICIT MEMORY TESTS Annual Technical Report, 1 Aug. 1992 - 31 Jul. 1993
Henry Roediger, III 1 Sep. 1993 11 p
(Contract F49620-92-J-0437)
(AD-A269900; AFOSR-93-0714TR) Avail: CASI HC A03/MF A01

During the past year grant related work has begun on five major projects and a similar number of projects less directly related to the original proposal, but still germane to it. Most of these concern the relation between measures of explicit and implicit memory performance, fulfilling the stated aims of the proposal. To cite some of our major findings during the first year of work, we have found that (1) priming on perceptual implicit memory tests can be boosted by imagery; (2) distinctive events that have powerful effects on explicit tests have little or no effect on perceptual priming; (3) a direct comparison of two methods for telling whether implicit memory tests are contaminated by conscious recollection both reveal that the tests are not contaminated, and (4) we have obtained some puzzling results (unlike those described above) which seem to indicate that repetition effects on implicit memory tests are more complicated than we had previously expected. Because we have just completed 12 months of a 36-month grant, some of the projects have not yet been completed. However, even after this first year, we plan to submit four papers on this work within the next few months. Most of the research conducted under the auspices of the grant has been at Armstrong Laboratories at Brooks AFB in San Antonio. This summer we have completed several pilot projects that will launch us on our second year's work at Armstrong Laboratories. Altogether, we tested some thirteen hundred subjects during the past year at Armstrong Laboratories, as well as several hundred more at Rice University, on these various projects. We believe we are making good progress toward our goals of the original proposal. DTIC

VISUAL PERCEPTION OF FEATURES AND OBJECTS Annual Report, 15 Mar. 1992 - 28 Feb. 1993
Anne Treisman 19 Mar. 1993 14 p
(Grant AF-AFOSR-0370-90)
(AD-A269879; AFOSR-93-0713TR) Avail: CASI HC A03/MF A01

This period of grant support was used to continue experiments on the

preattentive processing of features, focusing on the role of attention in the integration of information across opposite directions of contrast. While unicontrast dots can be integrated in parallel across space and time to give rise to preattentive perception of either orientation or motion, attention seems to be required when the dots are of opposite contrast, consistent with the predictions of feature integration theory. A new method of dissociating preattentive and attentive processing through selective adaptation was explored. The second main area of research concerned perception and visual memory for novel objects, using priming tasks to discover the nature of the representations formed either automatically or with attention. We discovered a surprising combination of plasticity and persistence in implicit memory: Unattended novel patterns apparently leave memory traces that are formed in a single presentation but persist across at least 200 intervening trials with other similar patterns. Yet no conscious explicit memory is available even immediately after the presentation.

OPERATOR PERFORMANCE IN PATTERN MATCHING AS A FUNCTION OF REFERENCE MATERIAL STRUCTURE Summary Report, FY 1992 and 1993
Marion P. Kibbe and Jan S. Stiff Sep. 1993 31 p
(AD-A269889; NAWCWPNS-TP-8145) Avail: CASI HC A03/MF A01

This report describes the results of two experiments that examine operator accuracies and response times to recognize matches and mismatches between line drawings and photographs. The line drawings used in the experiments were generated by the procedures used in the Land-Attack Multi-sensor Correlation (LMC), which is a targeting system under development at China Lake. The experiments varied the number of pixels in the line drawings, the manner in which the pixels were varied, and the kind of premission experience the operators had with the imagery. In addition, the performance results were used to demonstrate an approach that might be used to set a criterion score for calling out a match by the LMC.

PUTTING KNOWLEDGE TO USE: THE ACQUISITION AND TRANSFER OF KNOWLEDGE IN SITUATED PROBLEM SOLVING ENVIRONMENTS Final Report, Jan. 1989 - Dec. 1992
Michael D. McNeese Jan. 1993 137 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AF Proj. 7184)
(AD-A269746; AL/CF-TR-1993-0052) Avail: CASI HC A07

Within the areas of cooperative learning and group problem solving there has been great emphasis placed on the benefits of 'two heads being greater than one.' However, within each of these areas there is a lack of focus placed upon understanding naturalistic problems, the roles of metacognitive and perceptual expertise in collaboration, and the influence such factors have on transfer and use of knowledge from one situation to another. A research program is described which uses the Jasper series (a laser-disc based experimental macrocontext) to address these inadequacies and to investigate group-to-individual transfer in cooperative learning. The question asked is: 'What are the conditions in group collaboration which lead to a group member's use of knowledge as an individual?' Multiple statistical analyses were performed on various study components to clarify the relationships among individual and cooperative learning, collective induction, and the role of perceptual experience. Results highlight the different roles of perceptual context and collective induction in the knowledge acquisition/transfer process. Interpretation of the findings is given by proposing a situated cognition approach to problem solving. Finally, applications of the research suggest new forms of intelligent tutoring systems.

SERIAL PATTERN COMPLEXITY: IRREGULARITY AND HIERARCHY
P. A. vanderHelm, R. J. vanLier, and E. L. J. Leeuwenberg 1993 47 p See also PB85-200574 and PB88-209911 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-191914; Rept-91-NICI-05) Avail: CASI HC A03

In perception research, various models have been designed for the encoding of e.g. visual patterns, in order to predict the human interpretation of such patterns. Each of these encoding models provides a few coding rules to obtain codes of a pattern, each code expressing regularity and hierarchy in that pattern. Some of these models employ the minimum principle which states that the human interpretation of a pattern is reflected by the simplest code of that pattern. That is, the simplest code according to a given complexity metric. The authors propose a new complexity metric. The metric is based on a formal analysis of the concept of regularity. Some conclusions of the analysis are sketched. The new metric accounts for the amounts of irregularity and hierarchy as represented in a code of a pattern, such that these two amounts can be added to determine the complexity of a code.

STIMULUS-DRIVEN CAPTURE AND ATTENTIONAL SET: SELECTIVE SEARCH FOR COLOR AND VISUAL ABRUPT ONSETS Final Report
J. Theeuwes 25 Sep. 1992 22 p Sponsored by TNO Defence Research, Delft, Netherlands
(IZF-1992-B-9; TD-92-2292; ETN-93-94926) Copyright Avail: Issuing Activity (TNO Institute for Perception, Kampweg 5, 3769 DE Soesterberg, Netherlands)

Recent evidence suggests that the occurrence of attentional capture is contingent on the attentional control setting induced by the task demands. The experiments on which these conclusions are based can be criticized for several reasons: the contingent capture hypothesis was tested by means of two visual search tasks in which subjects searched multielement displays in which a color singleton and onset singleton were simultaneously present. When subjects had to search for a color singleton, on some trials another location contained an irrelevant onset. When subjects had to search for an onset singleton, on some trials another location contained an irrelevant color singleton. Both experiments show that the contingent capture hypothesis does not hold: attention was captured by the most salient singleton. The results suggest a stimulus driven model of performance on which selection is completely determined by the properties of the objects present in the visual field.

EFFECTS OF PRACTICE IN SELECTING AND EXECUTING KEYPRESSING SEQUENCES Final Report
W. B. Verwey 7 Oct. 1992 38 p Sponsored by TNO Defence Research, Delft, Netherlands
(IZF-1992-B-10; TD-92-2293; ETN-93-94927) Copyright Avail: Issuing Activity (TNO Institute for Perception, Kampweg 5, 3769 DE Soesterberg, Netherlands)

Three experiments that aimed at examining the effects of practice in a sequential keypressing task are described: in the first experiment a two choice sequence production task was practiced extensively. The second experiment assessed the effect of this practice on the production of a series of slightly changed sequences. In the third experiment a four choice reaction task was performed which included the practiced pair of sequences as well as a new pair in order to assess the effects of frequency of occurrence of each pair and their mutual similarity in terms of length and spatial layout. The results are used for the development of two sequence execution mechanisms. One allows programming to continue while the earlier keypresses in the sequence are already executed. The other allows unpacking of individual motor elements from a short term motor buffer during execution of the preceding keypresses. Practice with consistent stimulus sequence mappings made performance less sensitive to the presence of similar sequences than practice with varied mappings which suggests that stimulus sequence associations develop with consistent stimulus sequence mapping.

Activity (TNO Institute for Perception, Kampweg 5, 3769 DE Soesterberg, Netherlands)

The issue of selecting a response while executing earlier response movements is addressed. Although there is the general notion that this may be possible, there is no conclusive evidence on whether it can occur without interference. A direct test of whether concurrent response selection and execution of previous resonses develops with practice was carried out by having subjects press a number of keys, determined in advance, prior to pressing a stimulus dependent key. Response selection demands were varied by utilizing spatially compatible and incompatible stimulus response mappings the demands of which are known not to diminish much with practice. The results show that the longer time needed to select an incompatible response vanishes almost entirely when the stimulus dependent response is preceded by two and four predetermined key presses. The conclusion is drawn that response selection can concur with the execution of movement sequences without interference. ESA

PILOT STUDIES ON OBJECT MOTION PERCEPTION DURING LINEAR SELF-MOTION AFTER LONG DURATION CENTRIFUGATION OF HUMAN SUBJECTS Final Report

A. H. Wertheim 1 Feb. 1993 33 p Sponsored by TNO Defence Research, Delft, Netherlands

(IZF-1993-B-3; TD-92-3203; ETN-93-94930) Copyright Avail: Issuing Activity (TNO Institute for Perception, Kampweg 5, 3769 DE Soesterberg, Netherlands)

Four experiments are reported. They were carried out to investigate whether a particular experimental paradigm to investigate the effects of long duration centrifugation of human subjects could be used and optimized. The method involved the psychophysical measurement of visual thresholds for perceiving object motion during self motion on a linear track sled. The experiments were of a preliminary nature and definite conclusions as to their theoretical interpretation can not be drawn. Two hypotheses can be underlined: according to the first hypothesis, long duration centrifugation affects the way in which visual information interacts with otolith reactivity; according to the second hypothesis, subjects who rely largely on visual information for a correct percept of egomotion are more susceptible to centrifuge induced sickness than others. ESA

COGNITIVE ABILITY AND WHOLE-BODY ROTATION Final Report

L. C. Boer 3 Mar. 1993 25 p Sponsored by TNO Defence Research, Delft, Netherlands

(IZF-1993-B-4; TD93-0371; ETN-93-94931) Copyright Avail: Issuing Activity (TNO Institute for Perception, Kampweg 5, 3769 DE Soesterberg, Netherlands)

A series of studies examining how whole body rotation affects cognitive processing is summarized, and a new experiment is described. The main question was whether rotations of the body capture attention and reduce cognitive processing capacity. An additional question was whether the attention caught is resource specific, that is, whether particular cognitive capacities are more affected than others. Previous experiments revealed that cognitive processing comes to a complete standstill while body rotations are made actively on a swivel chair. The duration of the suspension depended on the nature of the cognitive task, suggesting resource specificity. In the present experiment a rotating chair was used on which subjects were rotated while performing on spatial and nonspatial tasks. Performance losses were small and limited to the spatial task. The conclusion based on the whole series of experiments is that body rotations capture general as well as specific processing capacity, but that the amount of capacity caught is small, or the duration of capacity capture is short. Large attention capture is expected only if subjects execute the rotations actively. The striking similarity with the effects of eye movements on cognitive processing suggests that the active search for new information in the visual environment is the real reason why whole body rotation can be so disturbing. ESA

N94-19443 Institute for Perception RVO-TNO, Soesterberg (Netherlands). Skilled Behavior Group.

EFFECTS OF LOCATION CUING ON REDUNDANT TARGET PROCESSING Final Report

J. Theeuwes 6 Jan. 1993 14 p Sponsored by TNO Defence Research, Delft, Netherlands

(IZF-1993-B-1; TD-92-3197; ETN-93-94932) Copyright Avail: Issuing Activity (TNO Institute for Perception, Kampweg 5, 3769 DE Soesterberg, Netherlands)

Redundancy gain is discussed. It is observed that subjects respond faster to simultaneously presented redundant targets than to single targets. This finding is usually interpreted as evidence for parallel, self terminating, unlimited capacity processing. It is claimed that the reaction time advantage with redundant targets is simply due to spatial uncertainty under single target conditions. The present study tested this hypothesis. Subjects responded when one, two or three letter E's were presented, and refrained from responding when one, two or three letter F's were presented. On half of the trials, location uncertainty was eliminated by presenting a line segment at one of the locations of the subsequently appearing target letters. The results reject the alternative spatial uncertainty explanation: even when the location of the impending target is cued in advance, there is no attenuation of the redundancy gain. ESA

MODELING OF DRIVER BEHAVIOR: INFORMATION PERCEPTION, RULE AND CONTROL STRATEGIES IN EXPERIMENTS AND SIMULATIONS Ph.D. Thesis [MODELLIERUNG DES FAHRERVERHALTENS: INFORMATIONSAUFNAHME, REGEL- UND STEUERSTRATEGIEN IN EXPERIMENT UND SIMULATION]

Mihaela Neculau 1992 112 p In GERMAN

(ETN-93-95053) Avail: CASI HC A06/MF A02

For modeling several aspects of driver behavior, such as controllability and information processing, driver, vehicle, and environment are included in a system. The optimal control model was used as the theoretical basis. A vehicle model is developed, which involves longitudinal and transverse dynamics; nonlinear characteristics line for the motor moment and dynamic wheel loading were assumed; peripheral forces were separately calculated for rolling and braking. The street contour was represented in fixed coordinates with a parameter dependent curvature variation. The driver was assumed to have an internal model of the effects of his actions and to be able to estimate distances and relative angle variations; he must have a spatial representation of observed objects location and their relative position. Modern cognitive psychology theories were used for describing information subjective interpretation and its consequences on information processing modeling. Measured data used for model validation were extracted from tests of rally driver performances. It is concluded that the model is a powerful simulation tool for engineers, as far as it allows standard maneuvers to be represented. ESA

INTEGRATED MEASUREMENT OF CREW RESOURCE MANAGEMENT AND TECHNICAL FLYING SKILLS Final Report, Feb. 1992 - May 1993

George L. Keampf and David W. Klinger Aug. 1993 114 p

(AD-A270512; DOT/FAA/RD-93/26; DOT-VNTSC-FAA-93-6) Avail: CASI HC A06/MF A02

The findings of a study designed with the objectives to produce a prototype performance measurement instrument (PMI) that integrates the assessment of Crew Resource Management (CRM) and technical flying skills and to investigate the suitability of the Critical Decision Method (CDM) for eliciting expert information concerning performance measurement are presented. The work was funded by the FAA in support of the Advanced Qualification Program (AQP) and conducted in cooperation with a major U.S. carrier. The researchers used CDM to identify critical components of performance assessment for specific flight tasks and developed a prototype PMI. The instrument contains two sections for each task. One section allows an evaluator to record significant pilot and crew behaviors observed; the second section allows the evaluator to provide a subjective assessment of pilot and crew proficiency. The researchers pretested the instrument and made revisions based on recommendations from experienced instructors. The researchers then evaluated the PMI with eight instructors observing a total of 16 different flight crews in recurrent training, performing a standard Line Oriented Flight Training (LOFT) scenario in a flight simulator. The instructors reliably and accurately employed the PMI to assess performance of the crew and the individual pilot. The authors recommended that AQP developers use Cognitive Task Analysis (CTA) techniques to develop training programs for cognitive and team tasks. DTIC

MAGNETOSTRICTIVE ACTUATORS FOR HUMAN SENSORY FEEDBACK Final Report, Jul. 1992 - Jan. 1993
Owen D. Brimhall, Daniel Knowlton, and Howard R. Curtin Feb. 1993 37 p
(Contract F41624-92-C-6005)
(AD-A269266; AL/CF-TR-1993-0074) Avail: CASI HC A03/MF A01

The development of actuators with enhanced capabilities is critical to the achievement of sensory feedback systems for intuitive, real time human operation of telerobotic systems. The objective of this research project was to demonstrate feasibility of new actuators using active materials which will enhance the capabilities of dexterous, exoskeletal feedback systems for telerobotic applications. In phase 1, feasibility of several novel Terfenol-D magnetostrictive actuators were demonstrated. Several prototype actuators were fabricated and tested, including resistive single axis brakes, resistive multiaxis (ball) brake joints, and linear motors. The new actuators are relatively efficient, responsive, small and exert high forces. The actuators provide proportional forces and are easily interfaced with digital electronics. Several of the actuators were integrated into a simple demonstration board. Phase 2 will pursue advanced development of proportional force resistive brake actuators and active linear motion actuators. DTIC

HUMAN RELIABILITY ANALYSIS APPLICATION GUIDE
May 1993 107 p
(Contract DE-AC05-84OR-21400)
(DE93-015361; ES/CSET-16) Avail: CASI HC A06/MF A02

Martin Marietta Energy Systems, Inc., (MMES) is engaged in a phased program to update the MMES safety documentation for the existing DOE facilities it manages. This guidance for Human Reliability Analysis (HRA) is intended for use in probabilistic safety analysis of DOE facilities. It is intended to supplement the Facility Safety Evaluation Application Guide, CSET-10, (July 1991), and subsequent revisions. The primary intended use of the guidance is to support accident analysis in Phase 2 of the Energy Systems Safety Analysis Report Update Program (SARUP). However, the guidance can be used for any safety analysis that needs human reliability analysis. The human reliability analysis methods covered by 'how-to' sections of the guide are direct application of or adaptations of methods developed for Probabilistic Risk Assessments (PRA) of nuclear power plants. The adaptations of these methods were designed to make the methods more suitable to DOE non-reactor applications. The methods have been adapted for use by the personnel who will perform the accident analysis task. This has been done by furnishing guidance intended for accident analysts who are experienced in human reliability analysis and by providing various methods of several levels of complexity and sophistication that lend themselves to a graded approach. The methods also lend themselves to progressive, iterative refinement so that the more burdensome versions of the methods may be reserved for use only when the importance to safety of the human reliability issues clearly warrants the time and effort. The recommended techniques build upon logic models of the human interactions with the facility that contribute to accident sequences. The recommended techniques employ assessments of a catalog of Performance Shaping Factors (PSF's) that influence the reliability of operating crews in carrying out their activities. DOE

ANALYSIS OF SEATING AND RESTRAINT LIMITATIONS RESTRICTING TOTAL BODY WEIGHT FOR AIRCREW AND PASSENGERS ON US ARMY HELICOPTERS
James E. Bruckhart, Joseph R. Licina, Samuel G. Shannon, and Joseph L. Haley Jul. 1993 23 p
(DA Proj. 3M1-62787-A-878)
(AD-A269117; USAARL-93-26) Avail: CASI HC A03/MF A01

Aviation Life Support Equipment (ALSE) and crashworthy seating protect the crew and passengers in military aircraft. If the user exceeds the design weight or size range for personal protective equipment, it may not function properly. The distribution and changes in body weight and relevant anthropometric measures were evaluated for soldier and aviator groups. Current ALSE and aircraft restraints were surveyed to determine the largest available sizes. Each aircraft seat was evaluated to determine the crash strength and maximum allowable weight for a given crash pulse. The 99th percentile male soldier and aviator weigh 237.5 and 228.2 pounds, respectively. The average body weight increases with age for the male aviator population. The largest available flight suit (size 48L), SRU-21/P survival vest, and webbing restraints accommodate a 47-inch waist circumference. DTIC

REVISION AND VERIFICATION OF A SEVEN-POINT WORKLOAD ESTIMATE SCALE Technical Information Manual, Jan. - Jun. 1992
Lawrence L. Ames and Edward J. George Jul. 1993 35 p
(AD-A269194; AFFTC-TIM-93-01) Avail: CASI HC A03/MF A01

This technical information memorandum presents the results of an AFFTC effort to revise and verify the technical characteristics of a seven-point workload estimate scale. The original scale was the School of Aerospace Medicine (SAM) Form 202. From the results of the revision effort, it was concluded that the AFFTC revised workload estimate scale would be suitable for flight test applications. DTIC

LUNAR BASE CONTROLLED ECOLOGICAL LIFE SUPPORT SYSTEM (LCELSS): PRELIMINARY CONCEPTUAL DESIGN STUDY Final Report
Steven H. Schwartzkopf 30 Apr. 1991 207 p
(Contract NAS9-18069)
(NASA-CR-188479; NAS 1.26:188479; LMSC-F280196) Avail: CASI HC A10/MF A03

The objective of this study was to develop a conceptual design for a self-sufficient LCELSS. The mission need is for a CELSS with a capacity to supply the life support needs for a nominal crew of 30, and a capability for accommodating a range of crew sizes from 4 to 100 people. The work performed in this study was nominally divided into two parts. In the first part, relevant literature was assembled and reviewed. This review identified LCELSS performance requirements and the constraints and advantages confronting the design. It also collected information on the environment of the lunar surface and identified candidate technologies for the life support subsystems and the systems with which the LCELSS interfaced. Information on the operation and performance of these technologies was collected, along with concepts of how they might be incorporated into the LCELSS conceptual design. The data collected on these technologies was stored for incorporation into the study database. Also during part one, the study database structure was formulated and implemented, and an overall systems engineering methodology was developed for carrying out the study. Author

BUILDING A JOINT-SERVICE CLASSIFICATION RESEARCH ROADMAP: CRITERION-RELATED ISSUES Final Report, Jan. 1992 - Apr. 1993

Deirdre J. Knapp and John P. Campbell Jul. 1993 98 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F33615-91-C-0015)
(AD-A269735; AL/HR-TP-1993-0028) Avail: CASI HC A05

The Air Force Armstrong Laboratory, the Army Research Institute, the Navy Personnel Research and Development Center, and the Center for Naval Analyses are committed to enhancing the overall efficiency of the Services' selection and classification research agenda. This means reducing redundancy of research efforts across Services and improving inter-Service research planning, while ensuring that each Service's priority needs are served. The Roadmap project is composed of six tasks. The first task identified classification research objectives. Tasks 2 through 5 consist of reviews of specific predictor, job analytic, criterion, and methodological needs of each of the methods and issues as they relate to the selection and classification research objectives outlined in Task 1 of the Roadmap project. ARMY COCKPIT DELETHALIZATION PROGRAM (CDP) Final Report, Oct. 1989 - Dec. 1992

Ricky L. Greth, Mark S. Pfaff, and W. B. Shope Aug. 1993 75 p
(Contract DAAJ02-89-C-0017)
(AD-A268990; CDP-871-041-A005; USAATCOM-TR-93-D-2) Avail: CASI HC A04/MF A01

Injury data indicate that secondary cockpit strikes to the head and upper torso account for approximately two-thirds of all major and fatal injuries in potentially survivable Army helicopter mishaps. A two-year program of research, biodynamic simulation, detail design, test, and evaluation was performed to examine the head/upper torso strike problem and demonstrate potential solutions. This report describes the investigation and conceptual process leading to the development of crew protection designs, including an advanced harness geometry, a harness tensioner/retractor, and a harness mounted airbag that could be candidates for current as well as year 2000+ helicopter or light aircraft applications. The protective concepts were evaluated in a series of computer simulations and in 15 dynamic tests on a horizontal accelerator using a replication of an advanced attack helicopter crewstation interior with a stroking crewseat. Overall effectiveness and physiological compatibility of the protective concepts were evaluated under varying crash pulses and impact orientations. Results show significant improvement in reduction of head displacement and linear acceleration, torso displacement, inertia reel strap payout, and neck torque compared to a baseline conventional restraint. A USER TASK ANALYSIS FOR COMMAND AND CONTROL SYSTEMS AND ITS USE IN HUMAN-COMPUTER INTERACTION RESEARCH Interim Report, 1 Oct. 1992 - 30 Jun. 1993

Deborah Hix 3 Sep. 1993 33 p
(AD-A269877; NRL/MR/5530-93-7397) Avail: CASI HC A03/MF A01

The Advanced Interfaces Section of the Human-Computer Interaction (HCI) Laboratory at the Naval Research Laboratory (NRL) is engaged in creating and evaluating interactive computer systems that address the unique issues encountered in developing innovative, high performance human-computer interfaces. A goal of this project is to build a testbed based on Naval command and control (C2) systems as a vehicle for this research. Previous work at the HCI Lab has developed new interaction techniques-ways of using physical input and output devices to perform tasks in a human-computer interface. We now wish to transition into more realistic Naval-related applications for new techniques, in particular, command and control systems. This report discusses a user task analysis performed for interactive computer-based C2 systems; this task analysis is a basis for developing and evaluating new interaction techniques. As a result of this task analysis, appropriate user tasks for incorporation into the command-and-control-like testbed will be identified. The testbed will also incorporate some of the new interaction techniques, and will be used for empirical evaluation of these techniques in human-computer interfaces. DTIC

ROAD MARCH PERFORMANCE OF SPECIAL OPERATIONS SOLDIERS CARRYING VARIOUS LOADS AND LOAD DISTRIBUTIONS

Joseph Knapik, Richard Johnson, Philip Ang, Herbert Meiselman, and Carolyn Bensel 1993 144 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A269198; USARIEM-T-14-93) Avail: CASI HC A07

This study examined the influence of load and load distribution on road march performance. Subjects were 21 Special Forces Soldiers who performed six individual road marches carrying three loads (34, 48, and 61 kg) and two pack systems (ALICE pack and an experimental double-pack). All marches were 20 km in length and soldiers were asked to complete the distance as rapidly as possible. Heart rates were monitored continuously during the march. Before and after each march, soldiers completed questionnaires and performed a series of tasks to evaluate cognitive ability and performance on typical soldier tasks. At the end of each march soldiers' feet were examined for injuries. Results indicated that march times increased as loads increased and march times were faster with the ALICE pack than with the double-pack. Heart rate while marching was lower for double-pack even after adjustment for march time suggesting a lower energy expenditure. The double-pack resulted in less low back discomfort and a lower incidence of blisters at the highest load but also resulted in more discomfort in the neck and hips and more heat illness symptoms. Neither load nor load distribution affected soldiers' cognitive ability or performance on marksmanship tasks, grenade throw, leg strength, hand-grip strength, or obstacle course. On the other hand, the march itself (independent of load and load distribution) resulted in decrements in marksmanship ability (vertical shot group dispersion), leg strength, and time to complete the obstacle course. INTERDISCIPLINARY TRAINING IN LIFE SCIENCE (FY 1991 ASSERT) Annual Report, 1 Jun. 1992 - 31 May 1993

Robert M. Steinman 4 Aug. 1993 4 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F49620-92-J-0260)
(AD-A269220; AFOSR-93-0677TR) Avail: CASI HC A01

This grant supports the interdisciplinary training (psychology, neuroscience, and computer science) of an advanced graduate student (Julie Epelboim), who is earning a Ph.D. in Psychology by participating as a graduate Research Assistant on AFOSR Grant 91-0124, entitled Coordinated action in 3-D Space. Her doctoral thesis will be derived from problems investigated in this parent grant which has two main thrusts. First, it tests alternative hypotheses about the mechanism that controls the gaze-shifts associated with arm motions, when an unrestrained, seated subject manipulates objects within arms's reach. The second thrust is to study the speed and accuracy of visually-guided hand movements and the correlation of these performance measures with binocular gaze-errors. Advancing knowledge in this rather technical interdisciplinary research area requires developing expertise in the areas included in Epelboim's AASSERT training program, which has been designed so as to contribute to the goals of the parent grant and at the same time prepare her for a productive career as a research scientist during the next 3 or 4 decades. THE FAA TECHNICAL CENTER HUMAN FACTORS LABORATORY INFORMATION GUIDE
Vincent J. Lasewicz, Jr. and Mark W. Smolensky Apr. 1993 16 p
(AD-A269343; DOT/FAA/CT-TN93/15) Avail: CASI HC A03/MF A01

This information guide provides an overview of the capabilities of the FAA Technical Center's Human Factors Laboratory (HFL) and how those capabilities are being used to support research critical to the development and implementation of the National Airspace System (NAS). The HFL was officially opened and dedicated on November 2, 1992. This unique state-of-the-art facility is the only one of its kind in the FAA. It is important that the information about this facility is made available not only to FAA organizations, but academic and private sector organizations as well. This information guide specifically provides the reader with background on why the facility was developed, an in-depth overview of its unique design capabilities, a description of the type of work the HFL will be engaged in, and a representative sampling of the directions and goals of the HFL. (Contract F33615-85-C-0541)
(AD-A270652; AL-TR-1993-0054) Avail: CASI HC A03/MF A01

Body size accommodation in USAF cockpits is still a significant problem despite all the years of experience and the many aircraft designs that have been developed. Adequate reach to controls, body clearances (particularly during escape), and vision (internal and external) are all functions of pilot body size and position in the cockpit. One of the roots of this problem is the way cockpit accommodation is specified and tested. For many years the percentile pilot has been used. This paper describes the errors inherent in the percentile man approach and presents a multivariate alternative for describing the body size variability existing in a given flying population. A number of body size representative cases are calculated which, when used properly in specifying, designing, and testing new aircraft, should ensure the desired level of accommodation. The approach can be adapted to provide anthropometric descriptions of body size variability for a great many designs or for computer models of the human body by altering the measurements of interest and/or selecting different data sets describing the anthropometry of a user population. HUMAN INTEGRATION EVALUATION OF THREE HELMET SYSTEMS Interim Report, Sep. 1991 - Nov. 1992
Sherri U. Blackwell and Kathleen M. Robinette Mar. 1993 108 p
(Contract F33615-89-C-0572)
(AD-A271320; AL-TR-1993-0028) Avail: CASI HC A06/MF A02

As protective equipment becomes more complex, more sophisticated tests of fit and function must be designed to determine and assess the effects of interactions between the user and various elements of the equipment. Among the newest protective ensembles available on the market are helmets with built-in Night Vision Goggles (WG's) or Helmet Mounted Displays (HMD's). A program called the Interim-Night Integrated Goggle and Head Tracking System (I-NIGHTS) was established to examine such helmets. Under this program, a series of fit and performance tests of three helmet systems was done. This report documents the fit, or human integration, evaluation designed to determine how well each helmet accommodated test subjects for comfort, stability, and optical placement. The test method used was the first to examine these three elements simultaneously as well as the first to include the measurement of head contour and three-dimensional placement of key human features. Results were intended to be used to better understand the fit related effects on later performance testing of subjects in a centrifuge, on a drop tower, and under actual flying conditions. Recommendations were made regarding design features which appear to be most effective for accommodating people. DTIC

HUMAN-MACHINE INTERFACES Final Report, 1 Mar. 1990 - 31 Jul. 1993
Nathaniel Durlach 31 Jul. 1993 26 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0200-90)
(AD-A270730; AFOSR-93-0769TR) Avail: CASI HC A03

The normal human auditory system suffers from many deficiencies in its ability to localize sound sources in space. Not only is it generally poor at determining the elevation and distance of a sound source, but in certain cases it is relatively poor at determining the azimuth of the source. The research discussed in this report is concerned with the development and evaluation of systems that result in improved localization, i.e., in supernormal auditory localization, by altering the localization cues that are available to the listener. Although such enhanced performance should be of value in essentially all systems that make use of auditory localization for conveying information to the human user, the application area of primary interest in this proposal is that of human-machine interfaces for teleoperator and virtual systems. In general, localization performance can be summarized in terms of (1) resolution and (2) response bias. Resolution refers to the ability to detect small changes in the spatial position of a sound source and to separate out multiple sources located at different positions, as well as to the amount of information transfer that can be achieved in the identification of source position. Response bias refers to the average differences between perceived source position (as measured by the mean of the listener's objective responses) and the actual source position. DTIC

MATHEMATICAL SCIENCES, TECHNOLOGY, AND ECONOMIC COMPETITIVENESS
James G. Glimm, ed. 1991 118 p Sponsored in part by AFOSR, ARO, DOE, NSF, National Security Agency, and ONR
(LC-91-60253; ISBN-0-309-04483-9) Avail: CASI HC A06/MF A02

The fundamental importance of mathematics to the U.S. technology base, to the ongoing development of advanced technology, and, indirectly, to U.S. competitiveness is well known in scientific circles. However, the declining number of U.S. high school students who decide to seek a career in science or engineering is an important indication that many people do not appreciate how central the mathematical sciences have become to our technological enterprise. The National Research Council's Board on Mathematical Sciences prepared this report to underscore the importance of supporting mathematics instruction at all levels, from kindergarten through graduate school, to prepare our youth for successful careers in science and engineering. To trace the impact of mathematics on U.S. technology necessarily involves making choices. The examples are intended to illustrate the widespread use of mathematical reasoning. The board focused primarily on the use of such reasoning by mathematical scientists themselves, as defined by their professional training, departmental or professional affiliation, or funding resources. Also included in this discussion are examples of the cross-disciplinary impacts of mathematical scientists working with members of other disciplines. A few examples were drawn from the mathematically oriented portions of related disciplines such as engineering and computer science. Derived from text

RESQme STUDIES FOR SDC REGIONAL COMPUTING CENTERS
C. T. Day Feb. 1993 35 p
(Contract DE-AC03-76SF-00098)
(DE93-015230; LBL-33540) Avail: CASI HC A03/MF A01

The Technical Design Report for the SDC proposes a model for offline computing which includes a computing center at the SSCL, containing all of the physics data, together with a number of regional computing centers around the world. These regional centers would contain subsets of the data, and would support the daily work of most physicists. For large or unusual requests, where the data are not held at the regional center, the requests would automatically be forwarded to the SSCL. It is assumed that the 'closeness' of the regional centers and their reduced demand from fewer users would result in improved system performance. Such a system is too complex to model analytically; simulation is the only viable approach. However, Monte Carlo models built from scratch for complicated systems are very difficult to maintain and hard to modify. Fortunately, we have obtained from IBM a modeling framework, RESQme, explicitly designed for building statistical models of computer systems. This note describes a first pass at modeling the proposed offline system. DOE

WHY ARE HUMAN-COMPUTER INTERFACES DIFFICULT TO DESIGN AND IMPLEMENT?
Brad A. Myers Jul. 1993 17 p
(Contract F33615-90-C-1465; ARPA Order 7597)
(AD-A268843; CMU-CS-93-183) Avail: CASI HC A03/MF A01

It is well known that designing and implementing a human-computer interface is a difficult and time-consuming task. However, there is little discussion of why this is true. Should we expect that a new method is around the corner that will make the design easier? Will the next generation of user interface toolkits make the implementation trivial? No. This article discusses reasons why user interface design and implementation are inherently difficult tasks and will remain so for the foreseeable future. DTIC

To better understand trends in the supply of and demand for computing professionals, the Computer Science and Telecommunications Board (CSTB) and the Office of Scientific and Engineering Personnel (OSEP) of the National Research Council convened an exploratory workshop. Understandably, given the complexity of the issues, the limited time available to workshop participants to address them, and the restricted attendance at the workshop, not all viewpoints were addressed; those addressed were not examined in equal depth; and it was not possible for participants to reach strong conclusions and to formulate detailed recommendations. Moreover, the views, requirements, and concerns of participants from academic computer science and engineering clearly differed from those of participants based in industry and government. Nonetheless, a number of notable findings emerged. This report summarizes the discussions at that workshop and the further deliberations of the steering committee that organized it. OPTOELECTRONIC PACKAGING: A REVIEW
R. F. Carson 1993 17 p Presented at the Annual Winter Meeting of the ASME, New Orleans, LA, 28 Nov. - 3 Dec. 1993
(Contract DE-AC04-76DP-00789)
(DE93-040059; SAND-93-1990C; CONF-931121-20) Avail: CASI HC A03/MF A01

Optoelectronics and photonics hold great potential for high data-rate communication and computing. Their wide use in computing applications was limited first by device technologies and now suffers due to the need for high-precision, mass-produced packaging. The use of photons as a medium of communication and control implies a unique set of packaging constraints that was not present in traditional telecommunications applications. The state-of-the-art in optoelectronic packaging is now driven by microelectric techniques that have potential for low cost and high volume manufacturing. DOE

SERVICE WITHOUT SERVERS
Chris Maeda and Brian N. Bershad Aug. 1993 7 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract MDA972-90-C-0035; ARPA Order 7330)
(AD-A270612; CMU-CS-93-144) Avail: CASI HC A02

We propose a new style of operating system architecture appropriate for microkernel-based operating systems: services are implemented as a combination of shared libraries and dedicated server processes. Shared libraries implement performance critical portions of each system service, while dedicated servers implement the parts of each service that do not require high performance or that are difficult to implement in an application. Our initial experiments show that this approach to operating system structure can yield performance that is comparable to monolithic kernel systems while retaining all the modularity advantages of microkernel technology. Since services reside in libraries, an application is free to use the library that is most appropriate. This approach can even yield better performance than monolithic kernel systems by allowing the shared libraries to be closely coupled with the applications, thereby exploiting application-specific knowledge in policy decisions. THE UNIVERSAL BitBus NODE [DE UNIVERSELE BITBUS NODE]
J. T. VanEs and G. Luigjes 1993 36 p In DUTCH
(DIGEL-1993-1; ETN-93-94622) Avail: CASI HC A03/MF A01

The hardware and software of the universal BitBus Module (MUTAD 910705) are described. This module or node was developed to fulfill the need of a small and simple microcontroller with sufficient analog and digital inputs/outputs. The BitBus network consists of a master node and one or several slave nodes. The master node is generally integrated in a host computer environment. The module consists of two prints. The first contains the BitBus microcontroller with ROM (Read Only Memory), RAM (Random Access Memory), and BitBus interface. The second print contains the analog and digital inputs and outputs. ESA

PLANNING UNDER UNCERTAINTY SOLVING LARGE-SCALE STOCHASTIC LINEAR PROGRAMS
G. Infanger (Technische Univ., Vienna, Austria.) Dec. 1992 116 p
(Contract DE-FG03-92ER-25116)
(DE93-013920; SU-SOL-92-8) Avail: CASI HC A06/MF A02

For many practical problems, solutions obtained from deterministic models are unsatisfactory because they fail to hedge against certain contingencies that may occur in the future. Stochastic models address this shortcoming, but up until recently seemed to be intractable due to their size. Recent advances both in solution algorithms and in computer technology now allow us to solve important and general classes of practical stochastic problems. We show how large-scale stochastic linear programs can be efficiently solved by combining classical decomposition and Monte Carlo (importance) sampling techniques. We discuss the methodology for solving two-stage stochastic linear programs with recourse, present numerical results of large problems with numerous stochastic parameters, show how to efficiently implement the methodology on a parallel multi-computer, and derive the theory for solving a general class of multi-stage problems with dependency of the stochastic parameters within a stage and between different stages. EMPLOYING KNOWLEDGE RESOURCES IN A NEW TEXT PLANNER ARCHITECTURE Research Report
Eduard Hovy, Julia Lavid, Elisabeth A. Maier, Vibhu O. Mittal, and Cecile L. Paris Apr. 1993 16 p
(Contract DABT63-91-C-0025)
(AD-A269669; ISI/RR-93-328) Avail: CASI HC A03/MF A01

We describe in this paper a new text planner that has been designed to address several problems we had encountered in previous systems. Motivating factors include a clearer and more explicit separation of the declarative and procedural knowledge used in a text generation systems as well as the identification of the distinct types of knowledge necessary to generate coherent discourse, such as communicative goals, text types, schemas, discourse structure relations, and theme development patterns. This knowledge is encoded as separate resources and integrated under a flexible planning process that draws from appropriate resources whatever knowledge is needed to construct a text. We describe the resources and the planning process and illustrate the ideas with an example. DTIC

AN EFFICIENT IMPLEMENTATION OF ERROR-VALUED SEMANTICS ON IMPERATIVE MACHINES Ph.D. Thesis
P. J. Miller Apr. 1993 122 p
(Contract W-7405-eng-48)
(DE93-014658; UCRL-LR-113559) Avail: CASI HC A06/MF A02

Error values must be implemented efficiently if they are to be useful for exception handling. Error values support implicit parallelism because they do not require explicit control flow primitives. Naive implementations test for error input values at each operation and propagate them to the outputs. Such an implementation is expensive on von Neumann style, imperative machines because the test-and-propagation overhead is more expensive than the actual computation. When run-time errors do not occur, any test-and-propagate work is wasted. However, it cannot generally be known at run-time whether or not a computation will generate errors. The challenge for the compiler is to preserve the error test-and-propagate semantics at a cost no higher than that of simple error detection. The dissertation presents a code space partitioning model for implementing error-valued semantics, which will be shown to work well on von Neumann architectures. Computation begins in a fast, error-free partition, and moves to a slower, safer, test-and-propagate partition when errors occur. The technique combines the speed of the error detect-and-halt model with the utility of the test-and-propagate model. If no errors occur, then the computation completes as fast as it would in error-detect only code. Additionally, for applicative languages, isolated blocks with errors can compute in the error-possible partition while other blocks can compute in the faster, error-testing free partition. The dissertation also presents a prototype compiler that uses the partitioning method to compile THISAL (a powerful subset of SISAL) programs. DOE

PROPOSAL FOR A NUMERICAL ARRAY LIBRARY
K. G. Budge 24 May 1993 37 p Presented at the American National Standards Institute and International Standards Organization Joint Meeting, Munich, Germany, 12-16 Jul. 1993 Revised
(Contract DE-AC04-76DP-00789)
(DE93-015017; SAND-93-1349C; CONF-930792-1) Avail: CASI HC A03/MF A01

One of the most widely recognized inadequacies of C is its low-level treatment of arrays. Arrays are not first-class objects in C; an array name in an expression almost always decays into a pointer to the underlying type. This is unfortunate, especially since an increasing number of high-performance computers are optimized for calculations involving arrays of numbers. On such machines, double (square brackets) may be regarded as an intrinsic data type comparable to double or int and quite distinct from double. This weakness of C is acknowledged in the ARM where it is suggested that the inadequacies of the C array can be overcome in C++ by wrapping it in a class that supplies dynamic memory management, bounds checking, operator syntax, and other useful features. Such 'smart arrays' can in fact supply the same functionality as the first-class arrays found in other high-level, general-purpose programming languages. Unfortunately, they are expensive in both time and memory and make poor use of advanced floating-point architectures. Is there a better solution? The most obvious solution is to make arrays first-class objects and add the functionality mentioned. However, this would destroy C compatibility and significantly alter the C++ language. Major conflicts with existing practice would seem inevitable. I propose instead that numerical array classes be adopted as part of the C++ standard library. These classes will have the functionality appropriate for the intrinsic arrays found on most high-performance computers, and the compilers written for these computers will be free to implement them as built-in classes. On other platforms, these classes may be defined normally, and will provide users with basic array functionality without imposing an excessive burden on the implementor. DOE

A MODIFIED DIRECT PRECONDITIONER FOR INDEFINITE SYMMETRIC TOEPLITZ SYSTEMS
P. Concus and P. Saylor (Illinois Univ., Urbana.) Nov. 1992 15 p
(Contract DE-AC03-76SF-00098)
(DE93-015234; LBL-33167; UIUCDCS-R-92-1782) Avail: CASI HC A03/MF A01

A modification is presented of the classical O(n(sup 2)) algorithm of Trench for the direct solution of Toeplitz systems of equations. The Trench algorithm can be guaranteed to be stable only for matrices that are (symmetric) positive definite; it is generally unstable otherwise. The modification permits extension of the algorithm to compute an approximate inverse in the indefinite symmetric case, for which the unmodified algorithm breaks down when principal submatrices are singular. As a preconditioner, this approximate inverse has an advantage that only matrix-vector multiplications are required for the solution of a linear system, without forward and backward solves. The approximate inverse so obtained can be sufficiently accurate, moreover, that, when it is used as a preconditioner for the applications investigated, subsequent iteration may not even be necessary. Numerical results are given for several test matrices. The perturbation to the original matrix that defines the modification is related to a perturbation in a quantity generated in the Trench algorithm; the associated stability of the Trench algorithm is discussed. THERMODYNAMICS OF COMPUTATION AND INFORMATION DISTANCE
C. H. Bennett, P. Gacs, M. Li, P. M. B. Vitanyi, and W. H. Zurek 12 Mar. 1993 21 p Presented at the Symposium on Theory of Computation, San Diego, CA, 7-11 Jun. 1993
(Contract W-7405-eng-36)
(DE93-012730; LA-UR-93-1569; CONF-9306155-1) Avail: CASI HC A03/MF A01

Applying the tools of algorithmic information theory, we compare several candidates for an asymptotically machine-independent. absolute measure of the informational or 'cognitive' distance between discrete objects x and y. The maximum of the conditional Kolmogorov complexities max(K(yz) K(my)), is shown to be optimal, in the sense of being minimal within an additive constant among semicomputable, symmetric, positive semidefinite functions of z and y satisfying a reasonable normalization condition and obeying the triangle intequality. The optimal metric, in turn, differs by at most an additive logarithmic term from the size of the smallest program for a universal reversible computer to transform x into y. This program functions in a 'catalytic" capacity, being retained in the computer before, during, and after the computation. Similarly, the sum of the conditional complexities. K(yx) + K(xy), is shown to be equal within a logarithmic term to the minimal amount Of information flowing out and in during a reversible computation in which the program is not retained. Finally. using the physical theory of reversible computation, it is shown that the simple difference K(x) - K(y) is an appropriate (i.e., universal, antisymmetric, and transitive) measure of the amount of thermodynamic work required to transform string x into string y by the most efficient process. DOE

VERIFICATION OF VALISYS CAD BASED CMM SOFTWARE AT LLNL
R. N. Frank 12 Nov. 1992 8 p Presented at the 75th Interagency Mechanical Operations Group Measurement Technology Subgroup Meeting, Livemore, CA, 12 Nov. 1992
(Contract W-7405-eng-48)
(DE93-013854; UCRL-JC-112020; CONF-9211237-1) Avail: CASI HC A02/MF A01 (US Sales Only)

This data was compiled as a first step in the quality assurance process for the VALISYS CMM programming and analysis system. The Nuclear Weapons Complex Coordinate Measuring Machine Test Artifact No. NWC101-3 was chosen as a test standard for two reasons. First, this same part had been measured previously on the LEITZ CMM at LLNL and sufficient data had been obtained for a direct comparison. Secondly, the LEITZ machines throughout the NWC performed exceptionally well in the actual DOE NWC study, thereby validating the LEITZ data as a reasonable standard. The LEITZ machine has a volumetric accuracy of 1.8 microns (70 mu(double prime)) as determined with a 450 mm MOORE step gage. This CORDAX data was measured on a Sheffield Cordax Apollo RS-50 DCC CMM, serial number A-0485-0989, between October 30 and November 4, 1992. The CORDAX is fitted with a RENISHAW PH-10 probe head and TP2 SW probe. The VALISYS system was used to facilitate the measurement and analysis of the part on the CORDAX CMM. VALISYS, running on a DEC platform, McDonnell Douglas UNIGRAPHICS CAD/CAM system, was used to create inspection tool (probing) paths and control the CMM through an interface with the Hewlett-Packard Model 310, Series 9000 computer running the Sheffield FLB3 software. VALISYS was then used to analyze the data and report the results. The CORDAX machine has an average volumetric accuracy of 9.6 microns in a (partial) 700 mm spherical envelope as determined through use of the Renishaw Machine Checking Gauge. DOE

SX USER'S MANUAL FOR SX, VERSION 2.0
S. A. Brown and D. Braddy Jan. 1993 70 p
(Contract W-7405-eng-48)
(DE93-015971; UCRL-MA-112315) Avail: CASI HC A04/MF A01

Scheme is a lexically scoped, properly tail recursive dialect of the LISP programming language. The PACT implementation is described abstractly in Abelson and Sussman's book, Structure and Interpretation of Computer Programs. It features all of the 'essential procedures' described in the 'Revised Report on Scheme' which defines the standard for Scheme. In PACT, Scheme is implemented as a library; however, a small driver delivers a stand alone Scheme interpreter. The PACT implementation features a reference counting incremental garbage collector. This distributes the overhead of memory management throughout the running of Scheme code. It also tends to keep Scheme from trying to grab the entire machine on which it is running which some garbage collection schemes will attempt to do. SX is perhaps the ultimate PACT statement. It is simply Scheme plus the other parts of PACT. A more precise way to describe it is as a dialect of LISP with extensions for PGS, PDB, PDBX, PML, and PANACEA. What this yields is an interpretive language whose primitive procedures span the functionality of all of PACT. Like the Scheme implementation which it extends, SX provides both a library and a stand alone application. The stand alone interpreter is the engine behind applications such as PDBView and PDBDiff. The SX library is the heart of TRANSL, a tool to translate data files from one database format to another. The modularization and layering make it possible to use the PACT components like building blocks. In addition, SX contains functionality which is the generalization of that found in ULTRA II. This means that as the development of SX proceeds, an SX driven application will be able to,perform arbitrary dimensional presentation, analysis, and manipulation tasks. Because of the fundamental unity of these two PACT parts, they are documented in a single manual. The first part will cover the standard Scheme functionality and the second part will discuss the SX extensions. DOE

N94-17917 National Physical Lab., Teddington (England). Information Technology and Computing Div.
POSTSCRIPT: A STUDY IN CONFORMITY
B. A. Wichmann Apr. 1993 49 p
(NPL-DITC-214/93; ETN-93-94958) Copyright Avail: National Physical Laboratory, Teddington, Middlesex, TW11 0LW, United Kingdom

The support given to standardized programming languages by means of validation suites is well understood. Although such suites are expensive to produce, suppliers and users can exploit them to ensure compilers conform to the standard. Less quantifiable aspects of compilers, such as 'quality' or 'user friendliness' could be left to market forces to resolve. The purpose of part of the current research program is to report how the methods adopted for compilers could be adapted to other areas. This report applies such methods to PostScript as a case study. MULTISTACK LANGUAGES AND GRAMMARS

Alessandra Cherubini, Luca Breveglieri, Claudio Citrini, and Stefano CrespiReghizzi Apr. 1993 39 p Sponsored in part by Ministry of University and Scientific Research and Technology and Commission of the European Communities

(Rept-93-016; ETN-93-94570) Avail: Issuing Activity (Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy)

A superfamily of context free formal languages is recognized by automata with a finite, ordered set of pushdown stacks. This n-stack machine can write in any stack, but it cannot read from a stack unless all preceding ones are empty. The languages are generated by n-depth grammars which differ from context free ones by having a n-tuple of strings on the right hand side of a production. A practical example is procedural nesting in Ada. This family enjoys several useful properties of context free languages (semilinearity, closure with respect to intersection with regular sets, etc.) and especially the Chomsky Schutzenberger homomorphic characterization (using a generalized Dyck language) and an iteration lemma. The latter allows to prove that n depth languages form an infinite hierarchical with respect to n. ESA

STRATEGIES FOR TESTING FORM ASSESSMENT SOFTWARE

M. G. Cox and A. B. Forbes Dec. 1992 29 p Sponsored by Dept. of Trade and Industry, London, England

(NPL-DITC-211/92; ETN-93-94887) Copyright Avail: National Physical Laboratory, Teddington, Middlesex, TW11 0LW, United Kingdom

Methods for generating test data sets and reference results which can be used to test assessment software employed in coordinate metrology for finding least squares best fit curves and surfaces to data are described. The methods do not rely on the use of reference software but instead exploit known mathematical properties which hold at the solution of the data approximation problem. The methods are flexible, straightforward to implement, and should be of value in designing conformance testing procedures. The methods are illustrated for the problem of finding the least squares best fit circle to data. ESA

CURRENT DEVELOPMENT IN SELECTED STRESS AND THERMAL ANALYSIS SOFTWARE INTERFACES WITH PRO-ENGINEER

J. Schulze 1993 25 p Presented at the Pro-users Meeting, Orlando, FL, 9 Jun. 1993

(Contract DE-AC04-76DP-00789)

(DE93-014935; SAND-93-1327C; CONF-9306173-1) Avail: CASI HC A03/MF A01

Ever since PRO-ENGINEER has become a dominating CAD package available to the public, some of us have been saying, 'Gee, if only I could export my geometry to a stress analysis program without having to recreate any of the details already created, wouldn't that be spectacular?' Well, much to the credit of the major stress and thermal analysis software vendors, some of them have been listening to design engineers like me badger them to furnish a seamless interface between PRO and their stress analysis programs. The down side of this problem is the fact that a lot of problems still exist with most of the vendors and their interfaces. I want to discuss the interfaces that I feel are currently 'State of the Art', and how they are developing and the future for finally arriving at a transparent procedure that an engineer at a workstation can utilize in his or her design process. In years past, engineers would develop a design and changes would evolve based on intuition, or somebody else's critical evaluation. Then the design would be forwarded to the production group, or the stress analysis group for further evaluation and analysis. Maybe data from a preliminary prototype would be collected and an evaluation report made. All of this took time and increased the cost of the item to be manufactured. Today, the engineer must assume responsibility for design and functional capability early on in the design process, if for no other reason than costs associated with diverse channels of critiquing. For that reason, one place to enhance the design process is to have the ability to do preliminary stress and thermal analysis during the initial design phase. This is both cost and time effective. But, as I am sure you are aware, this has been easier said than done. DOE

INTERACTIVE COLLABORATIVE ENVIRONMENTS (ICE) IN THE DESIGN TO MANUFACTURING PROCESS

M. R. Ashby, N. G. Rackley, M. Asher, and K. Musgrave Apr. 1993 11 p Presented at the 1993 American Telephone and Telegraph Design for X Conference, Albuquerque, NM, 12-13 May 1993

(Contract DE-AC04-76DP-00789)

(DE93-014994; SAND-93-1278C; CONF-9305170-3) Avail: CASI HC A03/MF A01

Interactive Collaborative Environments (ICE) technologies allow teams at separate locations to work concurrently on joint problem solving. Examples of ICE use include engineers simultaneously viewing and manipulating the same CAD application to discuss design/production changes and trade-offs. This concept was demonstrated in March of 1992 between AT&T, Shreveport Works and Holmdel. In May 1992, Sandia National Laboratories demonstrated a platform independent version of application sharing code using the workstations and application software available at AT&T, Shreveport Works. AT&T and Sandia are currently negotiating future work agreements. In addition, Sandia has provided demonstrations and created pilot project links for internal Sandia use, and for communication with other facilities, e.g. Los Alamos National Laboratories and Sandia, California location. ICE can also be used to link up suppliers and customers, even in different companies. Anywhere team members are separated geographically, or even between building and facilities at a particular site, ICE can improve remote problem solving, cutting down on delays and miscommunication fiascoes. AN ANALYTICAL APPROACH TO ERROR LOCALIZATION BY USING INFORMATION DERIVED FROM ERROR SIGNATURE

Serge Demidenko (Akademiya Nauk BSSR, Minsk.) and Vincenzo Piuri 1993 18 p Sponsored by CNR and Politecnico di Milano

(Rept-93-023; ETN-93-94573) Avail: Issuing Activity (Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy)

Signature registers are widely used in digital circuit diagnostics to compress the output sequences of the circuit under test. Compression essentially reduces the volume of diagnostic data: diagnosis of the faulty circuits is simplified since a fault is detected whenever the signature generated by testing does not match the reference value corresponding to fault free circuit. When an incorrect signature is observed, it is often desirable to identify, within the stream being compressed, the bit locations which caused the incorrect signature. An approach to localize the erroneous bits by using information contained in the error signature is presented. The analytical solution for the most general case is derived for any capacity of the signature register, for any feedback structure, for any number of channels, and for any length of the sequences being compressed. ANALYSIS, REPRESENTATION AND PROCESSING OF THE INSTRUMENTAL GESTURE: APPLICATION TO KEYBOARD INSTRUMENTS Ph.D. Thesis [ANALYSE, REPRESENTATION ET TRAITEMENT DU GESTE INSTRUMENTAL: APPLICATION AUX INSTRUMENTS A CLAVIER]

Christophe Ramstein 1991 213 p In FRENCH
(ETN-93-94402) Avail: CASI HC A10/MF A03

In the scope of studies involving computer assisted music, the gesture is described and stored as an assembly of sampled signals. The aim of the study is to design and construct a gesture editor to analyze, to represent and to process the stored gesture data. The study is also aimed towards the real time control of sound synthesis processing by stimulation of instrumental mechanisms and the study of its relationship with music. The representations of the instrumental gesture which are pertinent to a composer and well adapted to the informatic constraints are developed. The processing of the instrumental gesture organizes it under different logic at each representation level. Examples for testing and validating the results are proposed. ESA

OBJECT-ORIENTED EXTENSION OF A RELATIONAL DBMS Ph.D. Thesis [EXTENSION ORIENTEE OBJET D'UN SGBN RELATIONNEL]

Francois Exertier 1991 159 p In FRENCH
(ETN-93-94403) Avail: CASI HC A08/MF A02

The objective is the specification and development of a Relational Database Management System (RDBMS) which incoporates 'object' technology and concepts. The principle of the approach is to extend relational domains with Abstract Data Types (ADT) and consists of loosely coupling object concepts and mechanisms to the relational model and system. The data model and the features of the extension are defined. The concept of ADT is introduced in order to express new domains: an ADT specifies a data structure together with a set of methods which constitutes its manipulation interface. A simple inheritance mechanism is provided. Constructors are supplied to define the data structure of a type, introducing the notion of comiex object. The concept of sharing, based on object identity, is an important contribution of this work. The language which materializes the model is a SQL extension, named ESQL; methods are presently written using a C extension. The realization of such a system consists of the implementation of different components providing the object support and in the integration of these components to an existing RDBMS kernel. There are three main modules. The type manager is a part of a relational catalogue manager which handles ADT definitions. The method manager provides different functions like compilation and execution. The object manager supplies object storage and manipulation capabilities. ESA

AN OVERVIEW OF THE SAFSIM COMPUTER PROGRAM

D. Dobranich 1993 6 p Presented at the 10th Symposium on Space Nuclear Power and Propulsion, Albuquerque, NM, 10-14 Jan. 1993
(Contract DE-AC04-76DP-00789)
(DE93-017657; SAND-93-1215C; CONF-930103-42) Avail: CASI HC A02/MF A01

SAFSIM (System Analysis Flow SIMulator) is a FORTRAN computer program that provides engineering simulations of user-specified flow networks at the system level. It includes fluid mechanics, heat transfer, and reactor dynamics capabilities. SAFSIM provides sufficient versatility to allow the simulation of almost any flow system, from a backyard sprinkler system to a clustered nuclear reactor propulsion system. In addition to versatility, speed and robustness are primary goals of SAFSIM development. The current capabilities of SAFSIM are summarized and some sample applications are presented. It is applied here to a nuclear thermal propulsion system and nuclear rocket engine test facility. DOE

HIGH PERFORMANCE FORTRAN: AN OVERVIEW

M. E. Zosel 23 Dec. 1992 7 p Presented at the IEE COMPON Spring Meeting, San Francisco, CA, 22-26 Feb. 1993
(Contract W-7405-eng-48)
(DE93-017181; UCRL-JC-112573; CONF-9302135-1) Avail: CASI HC A02/MF A01

The purpose of this paper is to give an overview of the work of the High Performance Fortran Forum (HPFF). This group of industry, academic, and user representatives has been meeting to define a set of extensions for Fortran dedicated to the special problems posed by very high performance computers, especially the new generation of parallel computers. The paper describes the HPFF effort and its goals and gives a brief description of the functionality of High Performance Fortran (HPF). DOE

SOFTWARE TOOLKIT FOR ANALYSIS RESEARCH (STAR)

T. Burr, J. E. Doak, B. Hoffbauer, J. A. Howell, P. M. Kelly, L. McGavran, R. Pitts, J. M. Prommel, T. R. Thomas, and R. B. Strittmatter et al Aug. 1993 102 p
(Contract W-7405-eng-36)
(DE93-017368; LA-12617-MS) Avail: CASI HC A06/MF A02

The authors discuss the development of a Software Toolkit for Analysis Research (STAR) that will facilitate the development and interchange of algorithms for locating phenomena of interest in large quantities of data. Using this toolkit, researchers will be able to ascertain which existing techniques are the most promising, develop new and possibly more effective methods, and add/delete algorithms without major re-design work. This report describes the components of STAR, how these components will work together, and the algorithms with which they currently have expertise. Some modules or components of STAR will preprocess incoming data; some will select which information is appropriate for a particular application; some will analyze data to uncover items of significance; and others will assess the effectiveness of the various components. Some of the specific techniques employed by the various modules will be feature selection algorithms, machine learning algorithms, a purely statistical model, and expert system methodologies. DOE

A TIME-FREQUENCY SMOOTHING ALGORITHM FOR CYCLIC SPECTRAL ANALYSIS

R. S. Roberts 13 Aug. 1992 11 p Presented at the Workshop on Cyclostationary Signals, Yountville, CA, Apr. 1993
(Contract W-7405-eng-36)
(DE93-016634; LA-UR-93-1984; CONF-9304167-1) Avail: CASI HC A03/MF A01

A hybrid smoothing algorithm is described that smooths first in time and then in frequency. The time-frequency smoothing algorithm is designed to compute estimates of the cyclic (cross) spectrum along lines of constant cycle frequency. A variation on the algorithm, one that incorporates the One Bit Spectral Correlation Algorithm (OBSCA), is also described. A simulation study is presented that evaluates the algorithms. DOE

CUT AND PASTE BASED MODELING WITH BOUNDARY FEATURES
M. Ranta (Tokyo Univ., Japan.), M. Inui (Tokyo Univ., Japan.), F. Kimura (Tokyo Univ., Japan.), and M. Mantylae 1993 22 p
(PB93-187250; ISBN-951-22-1282-X) Avail: CASI HC A03/MF A01

The paper proposes a boundary feature approach that allows the user to define new features according to useful portions of previous design solutions. The approach is based on boundary manipulation operations that provide facilities for attaching and detaching boundary portions. A cut and paste style is introduced for the user interaction with boundary feature models. A small prototype system has been implemented in order to experience the suggested approach. NTIS

N94-18118# Helsinki Univ. of Technology, Espoo (Finland). Digital Systems Lab.
WEAKENED NEGATIVE INTROSPECTION IN AUTOEPISTEMIC REASONING
T. Janhunen Feb. 1993 89 p
(PB93-187375; ISBN-951-22-1407-5) Avail: CASI HC A05/MF A01

A new weakened scheme for negative introspection in autoepistemic reasoning is proposed. The scheme is formulated proof-theoretically in terms of enumerations of formulae. The resulting sets of conclusions based on the negative introspection principle, cautious autoepistemic expansions, generalize Moore style stable expansions such that every set of premises has a cautious expansion. A finitary characterization is developed for cautious expansions. The elimination of weakly grounded cautious expansions yields a subclass of cautious expansions: the N-grounded cautious expansions. The least N-grounded cautious expansion is shown to be unique and the intersection of all N-grounded cautious expansions. This is in contrast with Moore style stable expansions. The least N-grounded cautious expansion can be constructed iteratively as the least fixed point of a monotonic operator. A comparison is made with some other schemes of weakened negative introspection. The given set of examples demonstrates that the proposed negative introspection principle is stronger than that of the well-founded semantics. NTIS

TEXTURE SPLATS FOR 3D VECTOR AND SCALAR FIELD VISUALIZATION
R. A. Crawfis and N. Max Apr. 1993 9 p Presented at the Visualization 1993, San Jose, CA, 25-29 Oct. 1993
(Contract W-7405-eng-48)
(DE93-017104; UCRL-JC-113626; CONF-931080-3) Avail: CASI HC A02/MF A01

Volume Visualization is becoming an important tool for understanding large 3D datasets. A popular technique for volume rendering is known as splatting. In light of the new hardware architectures offering substantial improvements in the performance of rendering texture mapped objects, we present textured splats. An ideal reconstruction function for 3D signals is developed which can be used as a texture map for a splat. Extensions to the basic splatting technique are then developed to additionally represent vector fields. DOE

AN EVOLVING INFRASTRUCTURE FOR SCIENTIFIC COMPUTING AND THE INTEGRATION OF NEW GRAPHICS TECHNOLOGY
K. W. Fong Feb. 1993 8 p Presented at the 14th Annual Conference of the National Computer Graphics Association, Philadelphia, PA, 26-29 Apr. 1993
(Contract W-7405-eng-48)
(DE93-017164; UCRL-JC-113274; CONF-9304176-1) Avail: CASI HC A02/MF A01

The National Energy Research Supercomputer Center (NERSC) at the Lawrence Livermore National Laboratory is currently pursuing several projects to implement and integrate new hardware and software technologies. While each of these projects ought to be and is in fact individually justifiable, there is an appealing metaphor for viewing them collectively which provides a simple and memorable way to understand the future direction not only of supercomputing services but of computer centers in general. Once this general direction is understood, it becomes clearer what future computer graphics technologies would be possible and desirable, at least within the context of large scale scientific computing. NAVIGATION IN HYPERMEDIA APPLICATIONS: MODELLING AND SEMANTICS
Franco Garzotto, Luca Mainetti, and Paolo Paolini May 1993 35 p
Sponsored in part by Commission of the European Communities
(Rept-93-034; ETN-93-94580) Avail: Issuing Activity (Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy)

'Navigation' or 'browsing' is an important way of accessing information for a large class of applications: hypermedia, object oriented data bases, and multimedia data bases. In most systems today, the support for navigation is (still) very primitive. A variety of sophisticated navigation patterns, some of which involve integration with query mechanisms, are presented and their static and run time models are described. It is pointed out that the definition of an adequate browsing semantics requires a model for information and link structures which is more complex than the models commonly found in hypermedia or data bases. These concepts are illustrated by examples taken from a real life application for banking activities. ESA

EXACT COST FLOW PROBLEMS IN ACYCLIC NETWORKS
Vincenzo Caglioti and Marco Trubian 1993 11 p Sponsored in part by Ministry of University and Scientific Research and Technology
(Rept-93-030; ETN-93-94578) Avail: Issuing Activity (Politecnico di Milano, Piazza Leonardo da Vinci 32, 30133 Milan, Italy)

The NP-complete problem of finding a flow of cost equal to a given integer value (an exact-cost flow) in acyclic networks is addressed. This problem is reduced to the Exact weight Perfect Matching Problem on a bipartite graph (XPMB). The existence XPMB problem can be solved by a random pseudo-polynomial algorithm. A new constructive procedure for the XPMB problem is proposed, to be applied once the existence is given, whose time complexity is O(mT(sub TM)), where T(sub PM) indicates the time required for the randomized existence procedure, and m indicates the number of arcs in the bipartite graph. ESA

ANNEALING ALGORITHMS FOR MULTIRESOURCE ABSOLUTE LOCATION PROBLEMS ON GRAPH
Giovanni Righini Apr. 1993 15 p Sponsored in part by Ministry of University and Scientific Research and Technology
(Rept-93-028; ETN-93-94577) Avail: Issuing Activity (Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy)

A methodology is presented for applying annealing techniques to multisource absolute location problems on graphs. Two kinds of objective-functions are considered: barycenters and centers. Starting from the classical iterative algorithm 'cluster and locate', robust and distributed algorithms are developed, relying upon the relaxation of the integrality constraints on allocation variables. Experimental results are reported. ESA

SYNTHESIS TECHNIQUES AND ANALYSIS TOOL FOR ON-CHIP FAULT-TOLERANCE Final Report
Dhiraj K. Pradham 1993 17 p
(Contract N00014-91-J-1404)
(AD-A269148) Avail: CASI HC A03/MF A01

This report summarizes significant research on a broad range of issues related to fault-tolerant design both at the chip and system level. First discussed is an integrated approach, currently under development for integrating concurrent checking with BIST. The goal here is to generate synthesis tools to develop low cost fault-tolerant VLSI chip design tools that are both easy to test as well as being robust against operational errors. Section 2 reviews REACT, a tool currently under development for fault-tolerant architecture characterization. Finally, Section 3 presents on-going research on the development of novel fault-tolerant architectures. DTIC

TEACHING A COMPUTER SIMULATION COURSE WITH Ada Final Report
Edward L. Lamie May 1993 129 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract MDA972-92-J-1019)
(AD-A267901) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The purpose of this project was to develop a nucleus of routines, along with accompanying documentation, for use in software engineering courses in discrete-event system simulation. The system is called SIMPACK, after the main package that contains most of the simulation modules. SIMPACK was developed on an MS DOS computer using Meridian Ada, version 4.1.1. In addition to documentation, a floppy disk is included which contains all the Ada routines used, a compiled version of the system, and a template system to create data files for use by SIMPACK. THE CMU MASTERS IN SOFTWARE ENGINEERING CORE CURRICULUM
David Garlan, Alan Brown, Daniel Jackson, Jim Tomayko, and Jeannette Wing 6 Aug. 1993 20 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A268983; CMU-CS-93-180) Avail: CASI HC A03

Since 1989 Carnegie Mellon University has offered an academic program leading to a professional Master of Software Engineering (MSE) degree. The objective of the MSE program is to develop technical leaders in industrial software engineering. Students entering the program have at least two years industrial experience, and normally complete the program in sixteen months of full-time study. The MSE program is centered on a Software Development Studio, supported by a Core Curriculum and a set of elective tracks. These components occupy approximately 40%, 30%, and 30% (respectively) of a student's time in the program. In the Software Development Studio students plan and implement a significant software project for an external client over the full duration of the program. Students work in a team environment under the guidance of faculty advisors to analyze a problem, plan a software development project, execute a solution, and evaluate their work. The studio is similar to the design studios that characterize architectural degree programs. The MSE Core Curriculum develops foundational skills in the fundamentals of software engineering, with an emphasis on design, analysis, and management of large-scale software systems. DTIC

SOFTWARE RELIABILITY: ESTIMATION AND PREDICTION Final Report, 1 May 1989 - 31 Dec. 1992
Gordon Kaufman 31 Dec. 1992 18 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0371-89)
(AD-A268895; AFOSR-93-0657TR) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The principal purpose of this research was to provide new tools for measuring probabilities of failure free operation of software systems and to develop methods for predictions of software reliability. Links are established between stochastic models of fault occurrence suggested by Scholtz (1985) and Miller (1986) and an important class of finite population sampling models called 'successive sampling' in the sample survey literature. Successive sampling consists of sampling a finite population of objects, each with an assigned magnitude, proportional to magnitude and without replacement. Recognition of linkages between Schoz and Miller's 'Exponential Order Statistics Models' and successive sampling allows application of an emerging body of research on methods of estimation for successive sampling models to software reliability estimation. A CASE STUDY IN SOFTWARE MAINTENANCE Final Technical Report
Susan Dart, Alan M. Christie, and Alan W. Brown Jul. 1993 55 p
(Contract F19628-90-C-0003)
(AD-A269923; CMU/SEI-93-TR-08; ESC-TR-93-185) Avail: CASI HC A04/MF A01

In an effort to find out more about the tools, procedures, and techniques project personnel use in their work, the Computer-Aided Software Engineering (CASE) Environments Project interviewed personnel in eight software maintenance projects within an agency of the U.S/government. These interviews highlighted problems that we believe are typical of many software maintenance organizations (i.e., the need for more effective software maintenance tools, lack of communication between individuals working on similar projects, low status of maintenance personnel, and lack of a design-for-maintenance philosophy during the software development phase). This report highlights the findings of these interviews, provides our analysis of the findings, and makes recommendations directed at the agency for improvement in the areas of tools, people, and process. We believe that what we observed is very typical of the state of the practice in these areas and as such that this report and its recommendations are applicable to other large or small software maintenance projects. GENERATING OBJECT DESCRIPTIONS: INTERGRATING EXAMPLES WITH TEXT Research Report
Vibhu O. Mittal and Cecile Paris Jan. 1993 11 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DABT63-91-C-0025)
(AD-A269992; ISI/RR-93-327) Avail: CASI HC A03

Descriptions of complex concepts often use examples for illustrating various points. This paper discusses the issues that arise in generating complex descriptions in tutorial contexts. Although some tutorial systems have used examples in explanation, they have rarely been considered as an integral part of the complete explanation; they have usually been merely supportive devices and inserted in the explanations without any representation in the system of how the examples relate to and complement the textual explanations that accompany the examples. This can lead to presentations that are at best, weakly coherent, and at worst, confusing and mis-leading for the learner. In this paper, we consider the generation of examples as an integral part of the overall process of generation resulting in examples and text that are smoothly integrated and complement each other. We address the requirements of a system capable of this and present a framework in which it is possible to generate examples as an integral part of a description. DTIC

EFFICIENT TRANSPARENT OPTIMISTIC ROLLBACK RECOVERY FOR DISTRIBUTED APPLICATION PROGRAMS
David B. Johnson Mar. 1993 20 p
(Contract MDA972-90-C-0035; ARPA Order 7330)
(AD-A268981; CMU-CS-93-127) Avail: CASI HC A03/MF A01

Existing rollback-recovery methods using consistent checkpointing may cause high overhead for applications that frequently send output to the 'outside world,' since a new consistent checkpoint must be written before the output can be committed, whereas existing methods using optimistic message logging may cause large delays in committing output, since processes may buffer received messages arbitrarily long before logging and may also delay propagating knowledge of their logging or checkpointing progress to other processes. This paper describes a new transparent rollback-recovery method that adds very little overhead to distributed application programs and efficiently supports the quick commit of all output to the outside world. Each process can independently choose at any time either to use checkpointing alone (as in consistent checkpointing) or to use optimistic message logging. The system is based on a new commit algorithm that requires communication with and information about the minimum number of other processes in the system and supports the recovery of both deterministic and nondeterministic processes. PORTABLE PARALLEL RAY TRACING ALGORITHMS
Michael J. Garland May 1993 20 p
(AD-A268984; CMU-CS-93-176) Avail: CASI HC A03/MF A01

For a variety of reasons, realistic computer rendering is an important technology; it creates a wide range of new possibilities for effectively communicating information. The crucial goal is to provide realistic images in a short period of time. Ray tracing is a powerful technique for rendering. It is conceptually simple, and it can produce effects beyond the capability of some other more traditional methods. Unfortunately, ray tracing is rather expensive by comparison. This project is aimed at producing a reasonably fast and efficient ray tracer based on parallel ray tracing algorithms. The code is written in NESL, a data-parallel language developed by Guy Blelloch. It is supported on Cray Y-MP, Connection Machine CNI-2, and serial workstation platforms. DTIC

N94-18726# West Virginia Univ., Morgantown. Dept. of Electrical Engineering.
THE DEVELOPMENT OF A COURSE SEQUENCE IN REAL-TIME SYSTEMS DESIGN Final Report
H. H. Ammar Aug. 1993 219 p
(Contract MDA972-92-J-1022)
(AD-A269459) Avail: CASI HC A10/MF A03

This project deals with the development of a senior level course sequence in software intensive real-time systems. The sequence consists of a course in real-time software development, referred to in this report as the software course, followed by a course in hardware development and hardware-software interfacing, referred to in the sequel as the hardware course. The objective of the course sequence is to fill a demand in industry for real-time software engineers. It is aimed at preparing Computer Engineering students with a solid background in both software development and hardware design for an engineering industrial career in real-time systems development. The course sequence emphasizes practical standards, techniques, and tools for system development. Few universities include real-time systems development in their undergraduate Computer Engineering or Computer Science curriculum, forcing engineers to learn real-time methodology on-the-job. Real-time applications are increasing in complexity. Real-time designs have several performance as well as functional constraints, they have longer design cycles and larger project teams. They require more intricate real-time design work such as hardware interfacing, and often use multiprocessors in distributed environments. The growing complexity of real-time designs makes it difficult for an engineer to learn about real-time methodology on-the-job. DTIC

COMPUTER-AIDED PROTOTYPING SYSTEM (CAPS) WITHIN THE SOFTWARE ACQUISITION PROCESS. A CASE STUDY M.S. Thesis
Mary K. Ellis Jun. 1993 114 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A268705) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

This thesis provides a case study which examines the benefits derived from the practice of computer-aided prototyping within the software acquisition process. An experimental prototyping system currently in research is the Computer Aided Prototyping System (CAPS), managed under the Computer Science department of the Naval Post Graduate School, Monterey, California. This thesis determines the qualitative value which may be realized by applying the Computer-Aided Prototyping System (CAPS) to the initial stages of the acquisition process for a software system on the scale of a prototype model, then projecting the results to a real-time distributed computer system. As a prelude to this analysis, information is presented concerning how the acquisition process is currently managed within DoD and what role prototyping plays within that process. An introduction to the CAPS is then given, along with a description of its capabilities obtained through personal examination of the system. Following this walkthrough of the CAPS, software acquisition is discussed further, including an analysis of its major obstacles and where a CAPS could best be used within the acquisition cycle. This thesis concludes with a cost analysis and results from a comparison of performing a requirements analysis and feasibility study with and without a CAPS. DTIC

(AD-A269172) Avail: CASI HC A03

We are creating a new paradigm for building and maintaining complex real-time software systems for the control of moving mechanical systems. This objective is being met through the simultaneous development of both a powerful software environment and cogent motion planning and control capabilities. Our research concentrates on three key areas: (1) Building an innovative, powerful real-time software framework; (2) Implementing new distributed control architectures for intelligent mechanical systems; and (3) Developing distribution architectures and new algorithms for the computationally hard motion planning and direction problem. Perhaps more importantly, we are working on the vertical integration of these technologies into a powerful, working system. It is only through this coordinated, cooperative approach that a truly revolutionary, usable architecture can result. DTIC

A TEACHING TOOL FOR LINEAR PROGRAMMING M.S. Thesis
Wendy Cook 1 Jul. 1993 55 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A270240) Avail: CASI HC A04

This paper discusses several main concepts in linear programming. The purpose of this paper is to supplement the textbook teaching of these concepts to further the students' understanding. These main concepts include bases, extreme points, the simplex algorithm, and sensitivity analysis. Before any of these concepts are discussed, a necessary review of linear algebra is done. The ideas presented here should give the professor additional knowledge about how to successfully teach the students these concepts. Computer programs are developed in MOR/ML in order to aid in these discussions. MOR/ML is a computer programming language which has the syntax necessary to facilitate these concepts. MOR/ML is a set structured language which allows for the programming of matrices and sets. This structure makes it possible to formulate the programs dealing with linear programming. DTIC

Path planning has to be fast to support real-time robot programming. Unfortunately, current planning techniques are still too slow to be effective, as they often require several minutes, if not hours of computation. To alleviate this problem, we present a learning algorithm that uses past experience to enhance future performance. The algorithm relies on an existing path planner to provide solutions to difficult tasks. From these solutions, an evolving sparse network of useful subgoals is learned to support faster planning. The algorithm is suitable for both stationary and incrementally-changing environments. To analyze our algorithm, we use a previously developed stochastic model that quantifies experience utility. Using this model, we characterize the situations in which the adaptive planner is useful, and provide quantitative bounds to predict its behavior. The results are demonstrated with problems in manipulator planning. Our algorithm and analysis are sufficiently general that they may also be applied to task planning or other planning domains in which experience is useful. DOE

AUTOMATED ASSISTANCE FOR DETECTING MALICIOUS CODE
R. Crawford, P. Kerchen, K. Levitt, R. Olsson, M. Archer, and M. Casillas 18 Jun. 1993 14 p
(Contract W-7405-eng-48)
(DE93-018106; UCRL-JC-113874) Avail: CASI HC A03/MF A01

This paper gives an update on the continuing work on the Malicious Code Testbed (MCT). The MCT is a semi-automated tool, operating in a simulated, cleanroom environment, that is capable of detecting many types of malicious code, such as viruses, Trojan horses, and time/logic bombs. The MCT allows security analysts to check a program before installation, thereby avoiding any damage a malicious program might inflict. DOE

FINITE DIFFERENCE PROGRAM FOR CALCULATING HYDRIDE BED WALL TEMPERATURE PROFILES
J. E. Klein 29 Oct. 1992 45 p
(Contract DE-AC09-89SR-18035)
(DE93-019272; WSRC-TR-92-501) Avail: CASI HC A03/MF A01

A QuickBASIC finite difference program was written for calculating one dimensional temperature profiles in up to two media with flat, cylindrical, or spherical geometries. The development of the program was motivated by the need to calculate maximum temperature differences across the walls of the Tritium metal hydrides beds for thermal fatigue analysis. The purpose of this report is to document the equations and the computer program used to calculate transient wall temperatures in stainless steel hydride vessels. The development of the computer code was motivated by the need to calculate maximum temperature differences across the walls of the hydrides beds in the Tritium Facility for thermal fatigue analysis. Many designs use EPLD's (Erasable Programmable Logic Devices) to implement control logic and state machines. If the design is slow, timing through the EPLD is not crucial so designers often treat the device as a black box. In high speed designs, timing through the EPLD is critical. In these cases, a thorough understanding of the device architecture is necessary. This paper discusses lessons learned in the implementation of a high-speed design using the Altera EPM5130. DOE

A PROGRAMMING PARADIGM FOR DISTRIBUTED-MEMORY COMPUTERS
S. Crivelli and E. R. Jessup 30 Dec. 1992 4 p Presented at the 6th Society for Industrial and Applied Mathematics Conference on Parallel Processing for Scientific Computing, Norfolk, VA, 21-24 Mar. 1993
(Contract DE-FG02-92ER-25122)
(DE93-018336; DOE/ER-25122/5; CONF-930331-13) Avail: CASI HC A01/MF A01

One of the problems that arises in programming a multicomputer is the effective partitioning of the work into tasks and the assigning of those tasks to the processors. We will present a programming paradigm as a method of structuring the algorithms, allowing us to identify and separate programming phases. This paradigm allows us to develop a general software tool for dynamically allocating work to the processors while hiding many details of load balancing. Our paradigm consists of four phases: partitioning the work, mapping the tasks into the processors connected by some virtual topology, running the application program, and embedding the virtual architecture into the actual machine. The paradigm applies to diverse problems and to a variety of multiprocessors without significant reprograming. We will use the multisection method for computing eigenvalues to show how this tool works. DOE

CAVEMAN: CONFIGURATION AND VERSION MANAGEMENT
K. M. Dyer 12 Mar. 1993 164 p
(Contract W-7405-eng-48)
(DE93-018066; UCRL-MA-113603) Avail: CASI HC A08/MF A02

The mission of the CAVEMAN project is to provide the tools for large code systems so that those who work on them can perform source control and configuration control on UNIX-based file servers, rather than the LC Crays. An outside product called the Concurrent Versions System (CVS) has been chosen as the underlying source control system. It is a freeware program that runs on most UNIX stations. To quote from the CVS man page: CVS is a front end to the RCS revision control system which extends the notion of revision control from a collection of files in a single directory to a hierarchical collection of directories consisting of revision controlled files. These directories and files can be combined together to form a software release. CVS provides the functions necessary to manage these software releases and to control the concurrent editing of source files among multiple software developers. While CVS may be run directly, there are several tasks in the LLNL environment that it seemed either safer or easier to automate. CAVEMAN provides the needed functionality, generally in the form of wrappers to CVS. DOE

ASYNCHRONOUS RENDEZVOUS IN THE PRESENCE OF BACKTRACKING
A. Elieans and E. P. deVink Jun. 1992 29 p See also PB89-182828 and PB89-205256
(PB93-197739; IR-291) Avail: CASI HC A03/MF A01

The distributed logic programming language DLP extends Prolog with constructs for parallel object oriented programming. Its distinguishing feature is an asynchronous rendezvous that allows distributed backtracking over the solutions resulting from a method call. The paper studies the rendezvous mechanism of DLP. An abstract, uninterpreted language called Beta embodying the control flow skeleton of DLP is introduced and serves as a vehicle to clarify the asynchronous aspects of the rendezvous in the presence of backtracking. Both a transition system based operational semantics and a metric denotational semantics for Beta are presented. The notion of a resumption (an action that is delivered as the result of a method call) is proposed to describe the communication taking place between processes engaged in a rendezvous, and makes a remarkably smooth comparison possible of the two types of models. USEFUL LAMBDA NOTATION
R. Nederpelt and F. Kamareddine 1992 26 p
(PB93-191856; Computing-Science-Notes-92/22) Copyright Avail: CASI HC A03/MF A01

Lambda Calculus is fundamental for the foundation of Logic, Mathematics, Computer and Cognitive Science. This makes it indispensable to formalize the Lambda Calculus in a way which avoids most of the complications associated with, among others, substitution, variable renaming, the search of bound and free occurrences of variables. Combinatory Logic could be seen as an attempt to do so, but is not as intuitive as the lambda calculus. This paper provides a new formulation of the lambda calculus. Such a formulation is shown to be useful for term and variable manipulation and for locating the type of a term. This will have advantages on all areas of the lambda calculus including substitution (global and local), unification and typing. NTIS

(DE93-019201; CONF-931148-2) Avail: CASI HC A02/MF A01

The Department of Defense is sponsoring development of a centralized, integrated database, which will be a repository international surface cargo movement data. Scheduled for implementation surface in early 1994, the system will include a relational database management system, processing modules, and complex communication components. Four geographically separated sites are involved with development. Design and development of a major computer system is never simple, but when design and development occur at multiple sites, the problems are compounded, especially when the timeframe for project completion is extremely tight. Issues such as identical developmental platforms and communications strategies must be addressed. A design plan must be strictly followed to ensure consistency and to coordinate integration of modules developed at different sites. DOE

THE THEORY OF LINEAR PROGRAMMING: SKEW SYMMETRIC SELF-DUAL PROBLEMS AND THE CENTRAL PATH
B. Jansen, C. Roos, and T. Terlaky 1993 15 p Sponsored in part by Shell Research
(Contracts OTKA-2116; NWO-611-304-028)
(Rept-93-15; ETN-93-94642) Copyright Avail: CASI HC A03/MF A01

The literature in the field of interior point methods for linear programming has been almost exclusively algorithm oriented. Recently Guler, Roos, Terlaky and Vial presented a complete duality theory for linear programming based on the interior point approach. A more simple approach which is based on an embedding of the primal problem and its dual into a skew symmetric self dual problem is presented. This embedding is essentially due to Ye, Todd and Mizuno. First, a skew symmetric self dual linear program is considered. The strong duality theorem is shown to trivially hold in this case. Then, using the logarithmic barrier problem and the central path, the existence of a strictly complementary optimal solution is proved. Using the embedding just described, the strong duality theorem and the existence of strictly complementary optimal solutions for general linear programming problems are easily obtained. ESA

GENSHELL: A GENESIS DATABASE 2D TO 3D SHELL TRANSFORMATION PROGRAM
G. D. Sjaardema Jul. 1993 37 p
(Contract DE-AC04-76DP-00789)
(DE93-018694; SAND-93-1373) Avail: CASI HC A03/MF A01

GENSHELL is a three-dimensional shell mesh generation program. The three-dimensional shell mesh is generated by mapping a two-dimensional quadrilateral mesh into three dimensions according to one of several types of transformations: translation, mapping onto a spherical, ellipsoidal, or cylindrical surface, and mapping onto a user-defined spline surface. The generated three-dimensional mesh can then be reoriented by offsetting, reflecting about an axis, revolving about an axis, and scaling the coordinates. GENSHELL can be used to mesh complex three-dimensional geometries composed of several sections when the sections can be defined in terms of transformations of two-dimensional geometries. The code GJOIN is then used to join the separate sections into a single body. GENSHELL updates the EXODUS quality assurance and information records to help track the codes and files used to generate the mesh. GENSHELL reads and writes two-dimensional and three-dimensional mesh databases in the GENESIS database format; therefore, it is compatible with the preprocessing, postprocessing, and analysis codes in the Sandia National Laboratories Engineering Analysis Code Access System (SEACAS). THE EFFECTS OF INITIAL CONDITIONS AND CONTROL TIME ON OPTIMAL ACTUATOR PLACEMENT BY WAY OF A MAX-MIN GENETIC ALGORITHM
J. Redmond and G. Parker 1993 11 p Presented at the Annual Winter Meeting of the ASME, New Orleans, LA, 28-Nov. - 3 Dec. 1993
(Contract DE-AC04-76DP-00789)
(DE93-017640; SAND-93-1495C; CONF-931121-12) Avail: CASI HC A03/MF A01

This paper examines the role of the control objective and the control time in determining fuel-optimal actuator placement for structural vibration suppression. A general theory is developed that can be easily extended to include alternative performance metrics such as energy and time-optimal control. The performance metric defines a convex admissible control set which leads to a max-min optimization problem expressing optimal location as a function of initial conditions and control time. A solution procedure based on a nested Genetic Algorithm is presented and applied to an example problem. Results indicate that the optimal locations vary widely as a function of control time and initial conditions. DOE

CONTENT BASED-GRID NODE SELECTION FOR VECTOR FIELD VISUALIZATION
Theo vanWalsum 1993 14 p
(Rept-93-35; ETN-93-94662) Copyright Avail: CASI HC A03/MF A01

Data selection techniques are indispensable for exploration of large scientific datasets. A technique for content-based data selection is presented. This technique uses a selection expression, an expression consisting of conditions on data values. To select a set of grid nodes of a data set, the expression is evaluated for each grid node. The selected set of grid nodes can be visualized directly; it can be also be used for further exploration of the dataset. ESA

N94-19156# Technische Univ., Delft (Netherlands). Faculty of Technical Mathematics and Informatics.
A POLYNOMIAL PRIMAL-DUAL DIKIN-TYPE ALGORITHM FOR LINEAR PROGRAMMING
B. Jansen, C. Roos, and T. Terlaky 1993 25 p Sponsored in part by Shell Research
(Contracts OTKA-2116; NWO-611-304-028)
(Rept-93-36; ETN-93-94663) Copyright Avail: CASI HC A03/MF A01

A primal dual affine scaling method for linear programming is presented. The method yields a strictly complementary optimal solution pair, and also allows a polynomial time convergence proof. The search direction is obtained by using the original idea of Dikin, namely by minimizing the objective function (which is the duality gap in the primal dual case), over some suitable ellipsoid. This gives rise to completely new primal dual affine scaling directions, having no obvious relation with the search directions proposed in the literature so far. The new directions guarantee a significant decrease in the duality gap in each iteration, and at the same time they drive the iterates to the central path. In the analysis of the algorithm, a barrier function which is the natural primal dual generalization of Karmakar's potential function is used. The iteration bound is O(nL), which is a factor O(L) better than the iteration bound of an earlier primal dual affine scaling method (Monteiro, Adler and Resende). ESA

A MULTI-THREAD APPROACH TO COALESCING SMALL TRANSFERS GENERATED BY PORTABLE TOOL SETS
M. Fischler and M. Uchima Apr. 1993 23 p Presented at the Supercomputing Conference on High Performance Computing and Communications, Portland, OR, 15-19 Nov. 1993
(Contract DE-AC02-76CH-03000)
(DE93-012128; FNAL/C-93/076; CONF-931115-1) Avail: CASI HC A03/MF A01

An approach to providing scientific users with the means to code complex algorithms in a natural way is to provide portable tool sets implementing the concepts of each scientific field. These tool sets facilitate implementation on massively parallel systems, but often tend toward large numbers of small inter-CPU data transfers which adversely impact efficiency. We present techniques for mitigating this effect without affecting the way the user sees the tools. Efficiency improvements obtained by transfer coalescing via 'multi-threading' are studied in the context of Lattice Gauge Theory computations. DOE

MODELLING SOFTWARE FOR STRUCTURE METRICS

P. M. vandenBroek and K. G. vandenBerg Feb. 1993 21 p
(Memo-INF-93-13; ETN-93-94687) Copyright Avail: CASI HC A03/MF A01

In the approach to structural software metrics which has become standard nowadays, software is modeled by means of flowgraphs. A tacit assumption in this approach is that the structure of a program is reflected by the structure of the flowgraph. However, this assumption is not always true. An introduction of structure graphs for the modeling of software is presented. Structure graphs can, just as flowgraphs, be uniquely decomposed into a hierarchy of indecomposable prime structures. It is shown how programs in an imperative language can be modeled by means of structure graphs in such a way that the structure of a program is always reflected by the structure of the corresponding structure graph. A prototype implementation for the mapping of programs of a small example language to structure graphs, and for the decomposition of structure graphs into a hierarchy of indecomposable structure graphs, is given. A PARALLEL HASHED OCT-TREE N-BODY ALGORITHM

M. S. Warren and J. K. Salmon 29 Mar. 1993 22 p Presented at the Supercomputing Conference on High Performance Computing and Communications, Portland, OR, 15-19 Nov. 1993
(Contract W-7405-eng-36)
(DE93-012654; LA-UR-93-1244; CONF-931115-3) Avail: CASI HC A03/MF A01

The authors report on an efficient adaptive N-body method which was recently designed and implemented. The algorithm computes the forces on an arbitrary distribution of bodies in a time which scales as N log N with particle number. The accuracy of the force calculations is analytically bounded and can be adjusted via a user defined parameter between a few percent relative accuracy, down to machine arithmetic accuracy. Instead of using pointers to indicate the topology of the tree, each possible cell is identified with a key. The mapping of keys into memory locations is achieved via a hash table. This allows the access of data in an efficient manner across multiple processors using a virtual shared memory model. Performance of the parallel program is measured on the 512 processor Intel Touchstone Delta system. The authors also comment on a number of wide-ranging applications which can benefit from application of this type of algorithm. DOE

ABSTRACTING INTER-OBJECT COMMUNICATIONS USING COMPOSITION FILTERS

Mehmet Aksit, Ken Wakita (Tokyo Inst. of Tech., Japan.), Jan Bosch, Lodewijk Bergmans, and Akinori Yonezawa (Tokyo Univ., Japan.) Dec. 1992 24 p
(Memo-INF-92-78; ETN-93-94669) Copyright Avail: CASI HC A03/MF A01

One of the major obstacles in object oriented modeling is due to the lack of abstraction mechanisms for object interactions. The message passing model of conventional object oriented languages is considered as being too low level because it can only specify communications that involve two partner objects at a time and its semantics cannot be extended easily. The so called 'composition filters' approach 'modularly' extends the basic object model by introducing 'input' and 'output composition filters' that affect the received and sent messages respectively. This mechanism enables software engineers to abstract communications among objects into a first class object called 'Abstract Communication Type' (ACT). ACT's make it easier to enforce the invariant behavior among objects, to reduce the complexity of programs by hiding the interaction details, to improve reusability through the application of object oriented principles to ACT classes, and to enhance the expression power of the object oriented model. ESA

DATATYPELOG: A DEDUCTIVE OBJECT ORIENTED QUERY LANGUAGE

Rene Bal Dec. 1992 57 p
(Memo-INF-92-79; ETN-93-94670) Copyright Avail: CASI HC A04/MF A01

Object oriented systems have complex objects which are structured in a class hierarchy. Now that these systems have become more prevalent, there is a need for a well founded powerful query language. In the case of the relational model there exists such a language, Datalog. Datalog uses a logical programming style of expressing deductions concerning the contents of the database. However this could not be used for object oriented databases because it is untyped and it is unable to deal with complex objects and inheritance. A definition of DataTypeLog (DTL), which is an extension of Datalog with typing, complex objects, sets, and method calls, is presented. DTL is able to deal with inheritance and complex objects. Furthermore the concepts used in the theory of logical language are extended in order to define the semantics and the resolution of DTL programs. ESA

THE TM TYPING RULES

Rene Bal, Herman Balsters, and Rolf A. deBy Dec. 1992 12 p
(Memo-INF-92-80; ETN-93-94671) Copyright Avail: CASI HC A03/MF A01

Twente-Milano (TM) is a high level specification language for object oriented database schemas. Originally, TM was conceived of as a sugared layer on top of its formal counterpart, the formal language FM. The FM language consists of a typed lambda calculus employing a notion of subtyping and is based on the well known ideas of Cardelli-Wegner type theory. New aspects of FM are the incorporation of a full first order typed logic and a complete theory of object oriented set constructions. The formal meaning of a TM specification is given by its translation to FM, and the same applies to typing rules in TM. It is, however, possible to also give a type theory for the TM language itself; this typing of TM expressions should of course be consistent with the typing of the corresponding expressions in the FM counterparts of the translation. It is shown that such a typing of TM expressions is possible, hence yielding an independent type theory for the TM language. ESA

COMPUTER-ASSISTED INSTRUCTION AND NATURAL LANGUAGE SYSTEMS

M. Offereins Dec. 1992 28 p
(Memo-INF-92-86; ETN-93-94674) Copyright Avail: CASI HC A03/MF A01

An overview of the use of natural language in Computer Assisted Instruction (CAI) systems is given. CAI systems are viewed as computer applications in which the computer is used as a tutor. They provide instruction in a particular knowledge domain. CAI systems have traditionally been based on the use of static and predifined knowledge sources, like problem descriptions together with possible answers, errors, and feedback messages. More intelligent CAI systems use AI techniques to let the program itself reason about the user's progress in learning, and they create a more dynamic learning environment. In both approaches, the interface environment is essential as a means through which knowledge is communicated to the learner. The development of an intelligent CAI system is dependent on the development of an intelligent interface environment. Different types of CAI systems are distinguished as well as different types of communication styles. It turns out that communication is hardly based on natural language processing techniques, as these cause a lot of overhead. But, a special purpose Natural Language system can be developed and built into the interface environment of a CAI system, as the communication language for the instruction, or into a CAI system for learning a particular language skill. Furthermore, a general purpose Natural Language system can be developed and built into a CAI system for Language Learning. Different research applications in Computer Assisted Language Learning (CALL) and in instructional Natural Language Interfaces are discussed. The conclusions and recommendations show that there is still a huge research gap that needs to be filled in when talking about the communication of knowledge and the use of natural language processing techniques in CAI systems. GOAL-DRIVEN LOTOS EXECUTION

Ed Brinksma and Henk Eertink 1993 28 p
(Memo-INF-93-04; TIOS-93-02; ETN-93-94678) Copyright Avail: CASI HC A03/MF A01

An algorithm for the guided simulation of LOTOS (Language of Temporal Ordering Specification) specifications is presented. Based on the selection of a behavior expression occurrence contained in a LOTOS specification the algorithm determines a reduced inference system that calculates, if it exists, the shortest path from the initial state of the specification behavior to an 'active' context of the selected expression, that is, one in which it can execute (some of) its actions. Thus each selected occurrence gives rise to a corresponding filter over the usual action inference system of LOTOS. These filters are constructed using only static information of the LOTOS specification: the position of the selected behavior expression occurrence. Constructing and applying such filters for goal driven LOTOS execution has a better performance with respect to both speed and memory than full simulation using standard tree walking algorithms. This LOTOS execution model is especially useful for the experimental validation of process algebraic specifications and test (preamble) derivation from specifications. ESA

THE TM MANUAL VERSION 1.3 WORKING DOCUMENT

Rolf A. deBy, Herman Balsters, and Chris C. deVreeze Dec. 1992 36 p
(Memo-INF-93-06; ETN-93-94680) Copyright Avail: CASI HC A03/MF A01

TM (Twente Milano) is a high level specification language for object oriented database schemas. TM is based on a variant of Cardelli-Wegner type theory employing a notion of subtyping to describe a framework of inheritance. The TM language is meant as a user language, which means that the language should be able to be learnt and applied in a more or less easy manner, and without necessarily getting involved with formal semantics. A paper aimed at providing the essentials of the TM language without appealing to formal semantics is presented. The TM language is described by using syntax diagrams accompanied by informal explanations. Various example specifications are offered and some semantical issues are discussed. ESA

AN INNOVATIVE NEURAL MANUFACTURING CONCEPT

Chi Yung Fu 25 Mar. 1993 4 p Presented at the NCAICM Workshop, Albuquerque, NM, 30-31 Mar. 1993
(Contract W-7405-eng-48)
(DE93-017212; UCRL-JC-113619; CONF-9303198-2) Avail: CASI HC A01/MF A01

Researchers at Lawrence Livermore National Laboratory are developing a neural network system to provide intelligence for real-time, in-situ process monitoring, adaptive control, metrology, and equipment diagnostics. They call the applications of neural networks and other human-like intelligence to manufacturing 'neural manufacturing.' Performance, cost, and space requirements must be considered for implementing a neural network controller in a manufacturing environment. They are currently developing a 96-neuron cascadeable neural network VLSI chip for their process monitor/control system. This chip is expected to run at 12 billion interconnects per second and cost only a few hundred dollars. DOE

HOW TO APPLY THE IEEE STANDARDS TO SOFTWARE TESTING

J. Klamerus and J. Weeks Jun. 1993 19 p
(Contract DE-AC04-76DP-00789)
(DE93-018514; SAND-92-2521) Avail: CASI HC A03/MF A01

Testing is an important part of the software application development process. To achieve quality software deliverables and to avoid costly redevelopment of program code or repair of bad data, testing must be performed throughout the software development life cycle. This paper discusses a software engineering process to produce a software test plan based upon the IEEE (Institute of Electrical and Electronics Engineers) Software Engineering Standards Collection guidelines and corporate guidelines. Demonstrated examples of the software testing process involving interactive graphical user interface software and standard ASCII forms-based text are provided. Sandia National Laboratories has a Software Quality Assurance Department which provides corporate guidelines, in addition to recommending the use of IEEE processes. Both corporate guidelines and a specific subset of the IEEE guidelines were applied to the software development projects discussed herein. The rationale for applying a specific subset of the IEEE guidelines for each of the software development projects will be given. The development of the test procedures in the INGRES/WINDOWS 4GL environment (graphical user interface) as well as in the INGRES/ABF environment (Applications-By-Forms, ASCII Text) are presented and contrasted. The documentation of the testing process and results are explained. DOE

ADVANCES IN ARCHITECTURAL CONCEPTS TO SUPPORT DISTRIBUTED SYSTEMS DESIGN

Luis FerreiraPires, Chris A. Vissers, and Marten vanSinderen 6 Apr. 1993 29 p
(Memo-INF-93-17; TIOS-93-09; ETN-93-94690) Copyright Avail: CASI HC A03/MF A01

Some architectural concepts for distributed systems design are presented and discussed. These concepts are derived from an analysis of limitations of some currently available standard design languages. It is concluded that language design should be based upon the careful consideration of architectural concepts. This paper aims at supporting designers by presenting a methodological design framework in which they can reason about the design and implementation of distributed systems. The paper is also meant for language developers and formalists by presenting a collection of architectural concepts which deserve consideration for formal support. ESA

STOCHASTIC GRAMMARS: THEORY AND APPLICATIONS

Rieks opdenAkker Apr. 1993 21 p
(Memo-INF-93-19; ETN-93-94692) Copyright Avail: CASI HC A03/MF A01

An investigation of stochastic grammars and stochastic languages is presented. Their use as a formal model to describe statistical aspects of sentences in natural languages is discussed. Weakly restricted stochastic context free grammars are introduced and compared with the classical model of stochastic grammars. It is argued that a restricted stochastic grammar is a better model for ordering the structures of ambiguous sentences than the usual (unrestricted) stochastic grammars. The notion of consistency for these grammars is defined. Problems concerning parameters inference and stochastic parsing are stated. Several problems concerning inference of stochastic grammars and grammar classification are posed. ESA

VOLUME RENDERING OF 3D SCALAR AND VECTOR FIELDS AT LAWRENCE LIVERMORE NATIONAL LABORATORY

R. Crawfis, N. Max, B. Becker, and B. Cabral Apr. 1993 11 p Presented at the Supercomputing Conference on High Performance Computing and Communications, Portland, OR, 15-19 Nov. 1993
(Contract W-7405-eng-48)
(DE93-018000; UCRL-JC-113639; CONF-931115-9) Avail: CASI HC A03/MF A01

Simulation of complex three dimensional phenomena data sets which are hard to comprehend using conventional two-dimensionally oriented visualization tools is discussed. One way to overcome this limitation is to employ various volume visualization techniques. While early volume visualization techniques worked well on simple scalar volumes they failed to exploit frame buffer hardware capabilities and handle higher order data such as vector field. Work at Lawrence Livermore National Laboratory has centered on developing new techniques and extending existing techniques. DOE

USING GEOMETRIC TECHNIQUES TO IMPROVE DYNAMIC PROGRAMMING ALGORITHMS FOR THE ECONOMIC LOT-SIZING PROBLEM AND EXTENSIONS

C. P. M. VanHoesel, A. P. M. Wagelmans, and B. Moerman Nov. 1992 40 p See also N92-29819 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-197556; MEMO-COSOR-92-45) Avail: CASI HC A03

The paper discusses two basic geometric techniques that can be used to speed up certain types of dynamic programs. The authors first present the algorithms in a general form, and then they show how these techniques can be applied to the economic lot-sizing problem and extensions. Furthermore, it is illustrated that the geometric techniques can be used to give elegant and insightful proofs of structural results, like Wagner and Whitin's planning horizon theorem. Finally, the authors present results of computational experiments in which new algorithms for the economic lot-sizing problem are compared with each other, as well as with other algorithms from the literature. REFINING A TRIANGULATION OF A PLANAR STRAIGHT-LINE GRAPH TO ELIMINATE LARGE ANGLES

S. A. Mitchell 13 May 1993 22 p Presented at the 34th Meeting of the IEEE Foundation of Computer Science, Palo Alto, CA, 3-5 Nov. 1993
(Contract DE-AC04-76DP-00789)
(DE93-016510; SAND-93-1392C; CONF-931167-1-Extd-Abst) Avail: CASI HC A03/MF A01

Triangulations without large angles have a number of applications in numerical analysis and computer graphics. In particular, the convergence of a finite element calculation depends on the largest angle of the triangulation. Also, the running time of a finite element calculation is dependent on the triangulation size, so having a triangulation with few Steiner points is also important. Bern, Dobkin and Eppstein pose as an open problem the existence of an algorithm to triangulate a planar straight-line graph (PSLG) without large angles using a polynomial number of Steiner points. We solve this problem by showing that any PSLG with upsilon vertices can be triangulated with no angle larger than 7(pi)/8 by adding O(upsilon(exp 2) log upsilon) Steiner points in O(upsilon(exp 2) log(exp 2) upsilon) time. We first triangulate the PSLG with an arbitrary constrained triangulation and then refine that triangulation by adding additional vertices and edges. Some PSLG's require Omega(upsilon(exp 2)) Steiner points in any triangulation achieving any largest angle bound less than pi. Hence the number of Steiner points added by our algorithm is within a log upsilon factor of worst case optimal. We note that our refinement algorithm works on arbitrary triangulations: Given any triangulation, we show how to refine it so that no angle is larger than 7(pi)/8. Our construction adds O(nm+np log m) vertices and runs in time O((nm+np(log m)) log(m+ p)), where n is the number of edges, m is one plus the number of obtuse angles, and p is one plus the number of holes and interior vertices in the original triangulation. A previously considered problem is refining a constrained triangulation of a simple polygon, where p = 1. For this problem we add O(upsilon(exp 2)) Steiner points, which is within a constant factor of worst case optimal. DOE

NEW AUTOMATIC DEDUCTION TECHNIQUES IN FIRST ORDER FINITE AND INFINITE POLYVALENT LOGIC Ph.D. Thesis [NOUVELLES TECHNIQUES DE DEDUCTION AUTOMATIQUE EN LOGIQUES POLYVALENTES FINIES ET INFINIES DU PREMIER ORDRE]

Nicolas Zabel 1993 234 p In FRENCH
(ETN-93-95003) Avail: CASI HC A11/MF A03

Problems of studying polyvalent logic are recalled. A mechanical method of obtaining inference rules for propositional connectors of the tableaux method, from the matrical definition of logic, is elaborated. A similar treatment is done for the inference rules of the quantifiers. The refinement studied is thus a lazy skolemization. It enables unification to be used to calculate the useful instances to construct a closed tableau. Polyvalent logic with gradual equality is proposed, a method of ordered paramodulation resolution. Truth values are provided for lattice or two dimensional lattice structures. The systematic processing of finite logic follows a study of two typical cases of first order infinite polyvalent logic, the Post and Lukasiewicz logic. The link between Hornand Post logic is used to propose the automatization of Post logic based on possible semantic worlds. From this semantic a prefixed tableaux method is defined. To increase the efficiency, constraints resolved in polynomial time on the prefixes, are introduced. ESA

MULTIMODAL IMAGE CORRELATION APPLIED TO COMPUTER AIDED PEDICULAR SCREWING Ph.D. Thesis [MISE EN CORRESPONDANCE D'IMAGES MULTIMODALES APPLIQUEE A LA VISEE PEDICULAIRE ASSISTEE PAR ORDINATEUR]

Bruno Mazier 1992 158 p In FRENCH Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ETN-93-95018) Avail: CASI HC A08

Insertion of a screw in the solid zone of the pedicle bone of a lumbar vertebra allows to fix implants that are meant to correct some morphological pathologies of the spinal column. The aim of the Computer Aided Pedicular Screwing (CAPS) is to help surgeons to plan and make this critical task. Its principle is based on the three phases general methodology of image guided operating robot. It consists of rationally and quantitatively linking multimodal imaged information collected before and during the operation. The perception phase consists of acquiring and modeling before and during the operation the imaged information related to the vertebra to be installed. The acquisition always comes after the calibration of the image sensors used. During the decision phase the surgeon uses the former data to plan his operative strategy by simulation of this strategy. The different referentials used are linked by rigid transformations to find again, during the operation, the pre-operation planned strategy. The action phase allows to guide the gesture itself by using more or less robotized guiding systems. ESA

MANAGING PERSISTENT OBJECTS: FROM THE PROGRAMMING LANGUAGE TO THE SYSTEM Ph.D. Thesis [GESTION D'OBJETS PERSISTANTS: DU LANGAGE DE PROGRAMMATION AU SYSTEME]
Pascal Dechamboux 1993 168 p In FRENCH Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ETN-93-95021) Avail: CASI HC A08

PEPLOM (Persistent Programming Language for Object Management) is described at two levels: model definition and implementation. PEPLOM covers three main issues: safety, efficiency and flexibility of the application schema. It is a language based on the C/C++ language. Covering the combination of databases and programming languages, possible memory models to support various type systems are studied. Existing object oriented database management systems are evaluated and compared at different levels. The problem of programs structuration is solved by introducing types and modules: abstract types organize intentional data definitions while modules organize extensional data definitions. Two phases are required to produce PEPLOM programs. The first phase consists of defining application components. A dictionary, managed by the compiler, incrementally records all these components that compose the schema. It allows transient inconsistencies of this schema. The second phase consists of producing ready to run applications. The produced object code supports the structural and semantic data models and runs on a low level memory manager. The performance observed on the prototype implemented is comparable to that of persistent C++ systems offering less functionality. ESA

CONTRIBUTION TO APPLICATIONS SYSTEMS DESIGN MOSAIC METHOD IN THE ARISTOTE PROJECT Ph.D. Thesis [CONTRIBUTION A LA CONCEPTION LOGICIELLE DE SYSTEMES D'APPLICATIONS. LA METHODE MOSAIC DANS LE PROJET ARISTOTE]
Frederic Brissaud 1993 292 p In FRENCH
(ETN-93-95022) Avail: CASI HC A13/MF A03

Object Oriented Data Base Management Systems (OODBMS) integrate object languages concepts and DBMS mechanisms. They are suited to develop applications systems built on persistent data shared by various applications. The actual state of the art, focused on programming, database management and user interfaces, proposes specific techniques well adapted to design parts of these applications. Current methods do not permit complete and detailed design of applications systems, neither do they advise designers in programming application with OODBMS. The MOSAIC method was designed to develop applications systems running on OODBMS. Object oriented decomposition is used. A MOSAIC application has two components: the application body consists of applicative objects, models of real world entities, and the dialog manager consists of interactive objects, models of the man machine dialogs. Applicative objects, persistent or temporary, are both software modules and 'potentially persistent' or temporary data containers. Interactive objects group information and functions are presented to the user. An applications system is composed of an applicative objects base and of applications. The MOSAIC model allows the study of object and application systems according to the structural, functional and dynamic points of view. An O2 programmed example illustrates the MOSAIC method. ESA

OPTIMAL SAFETY SYSTEM DESIGN USING FAULT TREE ANALYSIS
J. D. Andrews Jun. 1993 32 p
(MATHS-Rept-A-187; ETN-93-94905) Avail: CASI HC A03/MF A01

A design optimization scheme for systems which require a high likelihood of functioning on demand is described. The final design specification is achieved by solving a sequence of optimization problems. Each of these problems is defined by assuming some form of the objective function and specifying a subregion of the design space over which this function will be representative of the system unavailability. An example of a high pressure protection system was used to demonstrate the technique. Design parameters for this system include redundancy levels, the number of elements required for a voting system to function, component selection options and maintenance inspection intervals. Both implicit and explicit contraint forms were used. The implicit constraints require a full system analysis to determine whether the current design is feasible or not. All system assessments were carried out using fault tree analysis. ESA

PROGRESS IN EDGE DETECTION
Marc Salotti Apr. 1993 34 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(RR-914-I; ETN-93-95002) Avail: CASI HC A03

A new approach to edge detection for gray level images is presented. The goal of edge detectors as an early stage of a machine vision, just finding relevant discontinuities in images, is defined. A survey of problems encountered in edge detection is presented: problems relative to noise, to specific configurations of gray values and problems relative to our way of working, particularly the methodology used to build an edge detector. A new edge detector that tries to solve the problems previously discussed is presented. It is an edge growing detector based on a powerful information management. The main features are an incremental approach justified by an adequate analysis of the problem 'focusing, exploration of the neighborhood and synthesis', and a cooperation with a region growing technique operating on a small area to compute a relative gradient. The protocol used to build the edge detector is new: no a priori edge model is chosen. The information management provides the main ideas for building the algorithm, then progressive algorithmic improvements are made towards a hypothetical ideal edge model. Some results are presented. ESA

CONTRIBUTION TO THE MODELLING AND THE IDENTIFICATION OF NONLINEAR MECHANICAL SYSTEMS Ph.D. Thesis [CONTRIBUTION A LA MODELISATION ET L'IDENTIFICATION DES SYSTEMES MECANIQUES NON-LINEAIRES]
Claude-Henri Lamarque 1992 449 p In FRENCH
(ECL-92-32; ETN-93-94592) Avail: CASI HC A19/MF A04

Tools to model and identify nonlinear mechanical systems are presented. Analytical nonlinearities are considered. Normal form theory brings back again classical results: frequency amplitude relation, resonances, bifurcation results. Classical or generalized nonlinear modes can be easily defined in the case of general finite number of freedom systems or Hamiltonian systems. Computation of periodic solutions is of special importance. The aim is to build nonlinear modes and to give a nonlinear superposition formula. It is shown that such an expression is approached by introducing generalized frequencies, generalized masses, and nonlinear modes. Stability analysis of periodic solutions is carried out by using normal form, or Poincare sections. Continuous systems are discretized. In order to investigate general behavior of nonlinear oscillators, software is developed. Classical quantities such as Lyapunov exponents, Poincare sections, fixed points, (un)stable manifolds, are calculated. Some examples of chaotic behavior are considered. ESA

ROBUSTNESS AND EFFICIENCY OF GENERALIZED PREDICTIVE CONTROL ALGORITHMS WITH GUARANTEED STABILITY
J. A. Rossiter and B. Kouvaritakis (Oxford Univ., England.) Jul. 1993 21 p
(MATHS-Rept-A-190; OUEL-1991/93; ETN-93-94908) Avail: CASI HC A03/MF A01

Modifications to the generalized predictive control algorithm which guarantee closed loop stability were proposed in three recent publications. Of these, the first two adopt the same philosophy, namely that of Constraint Receding Horizon Predictive Control (CRHPC), whereas the third adopts a Stable Generalized Predictive Control (SGPC) strategy by first stabilizing, then controlling the plant. The purpose of the study is to examine the relationship between CRHPC and SGPC. It is shown that the two approaches are theoretically equivalent, but it is also shown that CRHPC could be subject to significant numerical instability problems. Two alternative improved implementations of CRHPC are proposed. SGPC is shown to have the advantage both in terms of numerical stability and computational efficiency. ESA

A RESEARCH PROGRAM IN EMPIRICAL COMPUTER SCIENCE Final Report, 22 Nov. 1989 - 21 Nov. 1990
J. C. Knight Feb. 1991 24 p
(Grant NAG1-1073)
(NASA-CR-194069; NAS 1.26:194069; UVA/528334/CS91/101) Avail: CASI HC A03/MF A01

During the grant reporting period our primary activities have been to begin preparation for the establishment of a research program in experimental computer science. The focus of research in this program will be safety-critical systems. Many questions that arise in the effort to improve software dependability can only be addressed empirically. For example, there is no way to predict the performance of the various proposed approaches to building fault-tolerant software. Performance models, though valuable, are parameterized and cannot be used to make quantitative predictions without experimental determination of underlying distributions. In the past, experimentation has been able to shed some light on the practical benefits and limitations of software fault tolerance. It is common, also, for experimentation to reveal new questions or new aspects of problems that were previously unknown. A good example is the Consistent Comparison Problem that was revealed by experimentation and subsequently studied in depth. The result was a clear understanding of a previously unknown problem with software fault tolerance. The purpose of a research program in empirical computer science is to perform controlled experiments in the area of real-time, embedded control systems. The goal of the various experiments will be to determine better approaches to the construction of the software for computing systems that have to be relied upon. As such it will validate research concepts from other sources, provide new research results, and facilitate the transition of research results from concepts to practical procedures that can be applied with low risk to NASA flight projects. The target of experimentation will be the production software development activities undertaken by any organization prepared to contribute to the research program. Experimental goals, procedures, data analysis and result reporting will be performed for the most part by the University of Virginia. Derived from text

PROBLEM OF CONTROL IN AN INTEGRAL VISION SYSTEM: USE OF A MULTI-AGENT SYSTEM Ph.D. Thesis [PROBLEME DU CONTROLE DANS UN SYSTEME INTEGRE DE VISION: UTILISATION D'UN SYSTEME MULTI-AGENTS]
Olivier Boissier 1993 253 p In FRENCH Sponsored by EEC, and Grenoble-1 Univ., France
(ETN-93-95007) Avail: CASI HC A12/MF A03

Control aspects in an integrated computer vision system are studied. Such a system has an architecture which enables to add or retract dynamically both processing methods and representations schemes according to the type of the scenes to be treated. The control problem was decomposed in four different subproblems concerning the definition of the goal to be satisfied (decision), the selection criteria implied by this goal (adaptation), the action to be executed when applying these criteria (command), and the observations which must be collected for solving the former subproblems. A multi agent approach was adopted in order to design an open and flexible integration scheme. The control problems are represented in this architecture along two dimensions: individual control (internal control of an agent) and social control (interaction control). The control structure within each agent is organized in three different layers, which correspond to the resolution of the decision, adaptation and command problems respectively. The social control restricts the possible interaction and resolution methods which can be used by each of the agents. Protocols define the sequence of interactions between them. These two notions take part into our society model where three different control layers are responsible for solving each of the former control subproblems. The proposed architecture enables the study of control policies for deliberate and reactive behavior. On the other hand, it enables the dynamic integration of reconstruction and recognition processing modes into interaction management policies. The interest of this approach is illustrated by examples from the Vision As Process (VAP) system developed in the framework of the European project BRA3038. ESA

ON-LINE TEST METHODS OF MICROPROCESSOR BASED SYSTEMS Ph.D. Thesis [TEST EN LIGNE DES SYSTEMES A BASE DE MICROPROCESSEUR]
Thierry Michel 1993 271 p In FRENCH
(ETN-93-95008) Avail: CASI HC A12/MF A03

Online test methods using hardware devices dedicated to control flow checking in microprocessor based systems are considered. A compaction scheme (signature analysis) is used to facilitate the verification. Most of the methods proposed up to now require a program modification to force invariant properties (the signature at each point in the flowchart is independent from the previously followed paths). On the contrary, the methods proposed here do not require any modification in the verified program and use a watchdog processor with a local memory to ensure the signature is invariant. Two such methods are presented. The first one can be easily adapted to different microprocessors and is one of the most efficient methods proposed up to now. The second method, derived from the previous one, was proposed in order to reduce the amount of information required for test purpose. This latter method was implemented in a programmable logic controller and its efficiency was evaluated through fault injection experiments. The low overhead induced by the implemented mechanisms leads to envisage the evolution of the prototype towards an industrial product. ESA

CONCEPTION AND ANALYSIS OF NUMERICAL PARALLEL ALGORITHMS: REALIZATION ON THE CONNECTION MACHINE Ph.D. Thesis [CONCEPTION ET ANALYSE D'ALGORITHMES NUMERIQUES PARALLELES: REALISATIONS SUR LA CONNECTION MACHINE]
Denis Delesalle 1993 173 p In FRENCH Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ETN-93-95005) Avail: CASI HC A08

The limits of the Single Instruction Multiple Data (SIMD) mode within the frame of linear algebra algorithms using a Connection Machine 2 are presented. In particular, those of data parallelism ('one matrix element per processor') are developed. It is shown how, with new communication routines and a judicious mapping, close to the peak rate performance is obtained. But this method does not work for each algorithm. The BLAS decomposition for massively parallel algorithms is considered. They display the bottleneck in the Conjugate Gradient method. For this case, a solution which consists of a well known old method is proposed. Indeed, although its convergence is slower on sequential, its execution time is better on parallel. Moreover, the matrix structure is an important property. It leads to speed up the computation time and increases the dimension of problem. But the architecture is not yet taking account of it. Permutations and communications they bring about are considered. In the frame of Burg's algorithm, a solution which computes in the same time, the reflection coefficient and those of autocorrelation, is described. ESA

RADIOSITY ALGORITHMS USING HIGHER ORDER FINITE ELEMENT METHODS
R. Troutman and N. Max 1 Aug. 1993 6 p Presented at the Siggraph 1993 Special Interest Group on Graphics Conference, Anaheim, CA, 2-6 Aug. 1993
(Contract W-7405-eng-48)
(DE93-018098; UCRL-JC-113527; CONF-930881-4) Avail: CASI HC A02/MF A01

Many of the current radiosity algorithms create a piecewise constant approximation to the actual radiosity. Through interpolation and extrapolation a continuous solution is obtained. An accurate solution is found by increasing the number of patches which describe the scene. This has the effect of increasing the computation time as well as the memory requirements. By using techniques found in the finite element method, we can incorporate an interpolation function directly into our form factor computation. We can then use less elements to achieve a more accurate solution. Two algorithms, derived from the finite element method, are described and analyzed. DOE

MIMD MASSIVELY PARALLEL METHODS FOR ENGINEERING AND SCIENCE PROBLEMS
W. J. Camp and S. J. Plimpton 1993 16 p Presented at the 1993 International Simulators Conference on High Performance Computing, Arlington, VA, 29 Mar. - 1 Apr. 1993
(Contract DE-AC04-76DP-00789)
(DE93-019409; SAND-93-0875C; CONF-930372-12) Avail: CASI HC A03/MF A01

MIMD massively parallel computers promise unique power and flexibility for engineering and scientific simulations. We review the development of a number of software methods and algorithms for scientific and engineering problems which are helping to realize that promise. We discuss new domain decomposition, load balancing, data layout, and communications methods applicable to simulations in a broad range of technical field including signal processing, multi-dimensional structural and fluid mechanics, materials science, and chemical and biological systems. REFINEMENT OF UNIT CELL PARAMETERS BY LEAST-SQUARES: COMMENTS ON AN OLD TECHNIQUE AND THE DEVELOPMENT OF A NEW COMPUTER PROGRAM Final Report, May 1992 - Apr. 1993
C. L. Lowe-Ma Sep. 1993 31 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A270610; NAWC-WPNS-TP-8128) Avail: CASI HC A03

The determination of unit cell parameters from (x-ray) diffraction data is integral to studies to new crystalline materials. The sensitivity of unit cell parameters to microscopic compositional variations leads to their wide use in the characterization of materials with potentially useful optical and/or electronic properties. Consequently, precise (and accurate) cell parameters are needed even for samples in which incorporation of an internal standard is not possible. To eliminate the requirement of an internal standard, a computer program has been developed that explicitly include refinement of possible systematic errors and geometric aberrations along with the refinement of the unit cell parameters. CVL is a library of low-level vector routines callable from C. This library includes a wide variety of vector operations such as elementwise function applications, scans, reductions, and permutations. Most CVL routines are defined for segmented and unsegmented vectors. This paper is intended for CVL users and implementors and assumes familiarity with vector operations and the scan-vector model of parallel computation. DTIC

PROGRAM DESCRIPTIONS
25 Oct. 1992 36 p
(NSF-92-123) Avail: CASI HC A03/MF A01

Through its Directorate for Engineering (ENG), NSF promotes the progress of engineering and technology, helping the Nation stay in the forefront of technology by giving engineering education and research broad, long-range support. Engineering's mission is carried out through the creative interaction of the following seven divisions: (1) Biological and Critical Systems (BCS); (2) Chemical and Thermal Systems (CTS); (3) Design and Manufacturing Systems (DDM); (4) Electrical and Communications Systems (ECS); (5) Engineering Education and Centers (EEC); (6) Industrial Innovation Interface (III); and (7) Mechanical and Structural Systems (MSS). Each of these divisions are further subdivided into programs which are all described in this document. Derived from text

TECHNICAL DEVELOPMENT OF A THEORY OF PROGRAMS Ph.D. Thesis [FACHSPRACHLICHE ENTWICKLUNG EINER THEORIE DER PROGRAMME]
Burkhard Messer 1992 352 p In GERMAN Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ETN-93-95058) Avail: CASI HC A16

The technical terminology, needed for the formulation of program aspects and the result of programming process, which is produced and modified by means of programming environments, is theoretically investigated. It was ascertained why examinations of the terminology are essential for the research process; a methodological discussion shows that theoretical understanding of computer science is still incomplete for a program theory. The field of a program theory was regarded as a fundamental element of the computer science empirical theory, whose purely scientific and technological character was outlined, and a coarse structure of the network of partial theories was sketched. The reconstruction of core aspects of program theory was based on the idea that program semantics is established through interpretation rules of chemical and physical phenomena. An abstract model, which explains when the 'program' concept can be considered during the software development, was proposed. As a conclusion the interpretation of computer science was discussed in philosophical, technological and ethical terms. ESA

LEARNING ABOUT THE INTERNET BIBLIOGRAPHY AND BEGINNER'S GUIDE
Phyllis L. Ovsiew 16 Aug. 1993 29 p
(AD-A268847) Avail: CASI HC A03/MF A01

This documentation briefly describes and explores the basic functionality of using the Internet computer network for e-mail, ftp (file transfer protocol), and telnet. In addition, once these basics are mastered, the user is provided with a bibliography of sources available both on the Internet as well as traditional print sources. The bibliography is a short list of information resources (beginning and advanced) that will help the network novice become familiar with the Internet. The main focus is on material of use to the beginning networker. DTIC

ON THE COMPUTATION OF VERSAL FAMILY OF MATRICES
Laurent Stolovitch 21 May 1992 19 p
(RR-892-M; ETN-93-94983) Avail: CASI HC A03/MF A01

Algorithms for the computation of versal deformations of matrices are presented. A deformation of a matrix A(sub 0) is a holomorphic matrix valued function whose value at a point t(sub 0), a member of C(sup p), is the matrix A(sub 0). The properties of these matrices in a neighborhood of t(sub 0) are studied. It is possible for each value t in this neighborhood to compute the Jordan form as well as the change of basis matrix; but, generally, the result is not analytic. So, a deformation of the matrix A(sub 0) is constructed into which any deformation can be transformed by an invertible deformation of the matrix Id. After introducing the notion of versal deformation, computer algebra algorithms are provided to compute these normal forms. It is shown that a one parameter deformation can be transformed into a simpler form than the general versal deformation. ESA

(RR-905-I; LRI-786; LAAS-92382; ETN-93-95023) Avail: CASI HC A07

A critical analysis of the state of the art evolution of computer security from 1987 to 1992 is given. The basic concepts of computer security are overviewed and an extension to software security is included. Software integrity, confidentiality, and standardization approaches and the impact on object oriented systems are discussed. Recent developments in hardware, in particular those applying computer systems design and integration technologies, are presented. Concerning software, development models and object oriented programming approaches are considered. The constraints of the programming language logic, of PROLOG-3, of formal calculation, and of Ada and C++ on computer security are investigated. The influence of fault tolerance on the development of self testing components and the concept of fault tolerance software are discussed. Validation procedures on fault tolerance concepts are summarized. ESA

SOFTWARE REUSE: MAJOR ISSUES NEED TO BE RESOLVED BEFORE BENEFITS CAN BE ACHIEVED. REPORT TO THE CHAIRMAN, SUBCOMMITTEE ON DEFENSE, COMMITTEE ON APPROPRIATIONS, HOUSE OF REPRESENTATIVES
Jan. 1993 21 p
(GAO/IMTEC-93-16; B-251542) Avail: CASI HC A03/MF A01; also available from GAO, PO Box 6015, Gaithersburg, MD 20877

The Department of Defense (DOD) estimates that expenditures for developing and maintaining software for its weapons, command and control, and other automated information systems currently exceed $24 billion a year. In an attempt to better manage these costs and improve its ability to develop and maintain high-quality software, Defense has initiated a comprehensive effort to incorporate software reuse practices into its software development efforts. Software reuse -- the practice of developing new applications from existing software -- offers the potential to greatly reduce the time, cost and effort needed to develop and maintain high-quality software. This report provides background information on software reuse, including an overview of issues that can inhibit effective software reuse and information on Defense's strategy to implement a department-wide software reuse program. SeaTrack: GROUND STATION ORBIT PREDICTION AND PLANNING SOFTWARE FOR SEA-VIEWING SATELLITES
Kenneth S. Lambert (Maryland Univ., College Park.), Watson W. Gregg, Charles M. Hoisington (Science Systems and Applications, Inc., Lanham, MD.), and Frederick S. Patt (General Sciences Corp., Laurel, MD.) Dec. 1993 39 p
(NASA-RP-1331; NAS 1.61:1331; Rept-94B00031) Avail: CASI HC A03/mf A01

An orbit prediction software package (Sea Track) was designed to assist High Resolution Picture Transmission (HRPT) stations in the acquisition of direct broadcast data from sea-viewing spacecraft. Such spacecraft will be common in the near future, with the launch of the Sea viewing Wide Field-of-view Sensor (SeaWiFS) in 1994, along with the continued Advanced Very High Resolution Radiometer (AVHRR) series on NOAA platforms. The Brouwer-Lyddane model was chosen for orbit prediction because it meets the needs of HRPT tracking accuracies, provided orbital elements can be obtained frequently (up to within 1 week). Sea Track requires elements from the U.S. Space Command (NORAD Two-Line Elements) for the satellite's initial position. Updated Two-Line Elements are routinely available from many electronic sources (some are listed in the Appendix). Sea Track is a menu-driven program that allows users to alter input and output formats. The propagation period is entered by a start date and end date with times in either Greenwich Mean Time (GMT) or local time. Antenna pointing information is provided in tabular form and includes azimuth/elevation pointing angles, sub-satellite longitude/latitude, acquisition of signal (AOS), loss of signal (LOS), pass orbit number, and other pertinent pointing information. One version of Sea Track (non-graphical) allows operation under DOS (for IBM-compatible personal computers) and UNIX (for Sun and Silicon Graphics workstations). A second, graphical, version displays orbit tracks, and azimuth-elevation for IBM-compatible PC's, but requires a VGA card and Microsoft FORTRAN. Author (revised)

ON THE AUTOMATION OF OBJECT-ORIENTED REQUIREMENTS ANALYSIS Ph.D. Thesis
Nancy L. Crowley Sep. 1993 281 p Limited Reproducibility: More

than 20% of this document may be affected by microfiche quality
(AD-A270673; AFIT/DS/Eng/93-11) Avail: CASI HC A13

The research investigated the possibility that an object-oriented requirements analysis (OORA) specification model can be represented in a computer system and used as a basis for the elicitation of the information necessary for the development of an object-oriented specification for a particular problem. The proof-of-concept system developed is called the OORA Automated Knowledge System (OAKS). OAKS contains a generic domain model that is modified to satisfy a particular problem in the domain. The core of OAKS is a reusable domain model, which represents a domain of interest. The domain model is used as a basis for user changes that are made to meet specific requirements of a particular problem. The domain model was structured to allow it to be ported to other domains of interest and inserted into the OAKS system. Therefore, OAKS represents an OORA system that can be used in numerous domains to develop an OORA specification for a particular problem. DTIC

A parallel method for finding the orthogonal eigenvectors of a real symmetric tridiagonal is described. The method uses inverse iteration with repeated Modified Gram-Schmidt (MGS) reorthogonalization of the unconverged iterates for clustered eigenvalues. This approach is more parallelizable than reorthogonalizing against fully converged eigenvectors as is done by LAPACK's current DSTEIN routine. The new method is found to provide accuracy and speed comparable to DSTEIN's and to have good parallel scalability even for matrices with large clusters of eigenvalues. We present empirical results for residual and orthogonality tests plus timings on IBM RS/6000 (sequential) and Intel Touchstone DELTA (parallel) computers. DOE

PARX, KERNEL OF A SYSTEM FOR MASSIVELY PARALLEL COMPUTERS: CONTROL OF COMMUNICATION BETWEEN PROCESSES Ph.D. Thesis [PARX, NOYAU DE SYSTEME POUR LES ORDINATEURS MASSIVEMENT PARALLELES: CONTROLE DE LA COMMUNICATION ENTRE PROCESSUS]
Nestor A. GonzalezValenzuela 1991 236 p In FRENCH Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ETN-93-94353) Avail: CASI HC A11

Design aspects involving the application of a communication kernel which is part of PARX (a parallel processing system program for multiprocessors without common memory) are considered. The kernel builds a virtual machine for which the assembly of processors is independent of the underlying interconnection network topology. The state of the art of parallel computers architecture is reviewed. A model and a process for a parallel system kernel are proposed. The model is based on an entity assembly adapted to the process control of parallel programs composed of communicating processes. The communicating process cooperates by message exchanging. The communication control and the synchronism between processes are investigated. ESA

PARX: ARCHITECTURE OF AN OPERATING SYSTEM FOR PARALLEL MACHINES Ph.D. Thesis [PARX: ARCHITECTURE DE NOYAU DE SYSTEME D'EXPLOITATION PARALLELE]
Yves Bertrand LangueTsobgny 1991 174 p In FRENCH Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ETN-93-94401) Avail: Issuing Activity (European Space Agency (ESA))

The architecture of the kernel of an operating system for parallel machines is presented. Paradigms for supporting parallel applications at the level of the kernel of an operating system are discussed. Emphasis is given to issues related to process and communication models. The study is based on the following: parallel programming models as defined in progamming langages; and architectures of modern, parallel machines. This two pronged approach allows progress in expressing and actually using parallelism and tendencies and technical improvements in parallel machines technology to be taken into account. The main result is the design of the architecture of an original parallel operating system, PARX, and the design and implementation of a communication kernel for that system. Operating systems can no longer pretend to offer a range of services suitable for all types of applications. As they support a growing spectrum of applications, their functionalities now tend to be split into a kernel called 'micro,' 'light,' and a set of high level servers, which is the approach developed in this investigation. ESA

THE EVOLUTION OF THE PVM CONCURRENT COMPUTING SYSTEM
G. A. Giest and V. S. Sunderam (Emory Univ., Atlanta, GA.) 1993 10 p Presented at the Institute for Electronic and Electrical Engineers (IEEE) COMPON Spring Meeting, San Francisco, CA, 22-26 Feb. 1993
(Contract DE-AC05-84OR-21400)
(DE93-017764; CONF-9302135-2) Avail: CASI HC A02/MF A01

Concurrent and distributed computing, using portable software systems or environments on general purpose networked computing platforms, has recently gained widespread attention. Many such systems have been developed, and several are in production use. This paper describes the evolution of the PVM system, a software infrastructure for concurrent computing in networked environments. PVM has evolved over the past years; it is currently in use at several hundred institutions worldwide for applications ranging from scientific supercomputing to high performance computations in medicine, discrete mathematics, and databases, and for learning parallel programming. We describe the historical evolution of the PVM system, outline the programming model and supported features, present results gained from its use, list representative applications from a variety of disciplines that PVM has been used for, and comment on future trends and ongoing research projects. DEVELOPMENT OF PARALLEL ARCHITECTURES FOR SENSOR ARRAY PROCESSING, VOLUME 1 Final Report
M. M. Jamali and S. C. Kwatra Aug. 1993 90 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-91-J-1011)
(AD-A270426; DSPH-3-Vol-1) Avail: CASI HC A05

The high resolution direction-of-arrival (DOA) estimation is important in many sensor systems. It is based on the processing of the received signal and extracting the desired parameters of the DOA of plane waves. Many approaches have been used for the purpose of implementing the function required for the DOA estimation. The Multiple Signal Classification (MUSIC) and the Estimation of Signal Parameters by Rotational Invariance techniques (ESPRIT) algorithms are two novel approaches used recently to provide asymptotically unbiased and efficient estimates of the DOA. They are believed to be promising and appropriate for hardware implementation for real time applications. They estimate the so called signal subspace from the array measurements. The parameters of interest (i.e. determining of the DOA) are then estimated from the intersection between the array manifold and the estimated subspace. DTIC

DEVELOPMENT OF PARALLEL ARCHITECTURES FOR SENSOR ARRAY PROCESSING. VOLUME 2: A PARALLEL ARCHITECTURE FOR BROAD-BAND DIRECTION-OF-ARRIVAL ESTIMATION Final Report
M. M. Jamali, S. C. Kwatra, and Raja F. Tabar Aug. 1993 138 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-91-J-1011)
(AD-A270427; DSPH-3-Vol-2) Avail: CASI HC A07/MF A02

One of today's problems in signal processing is the identification of direction-of-arrival (DOA) for multiple broad-band sources. Many algorithms have been proposed in the literature, however, the algorithms are highly complex and require a lot of computing power. New technologies in the past two decades have decreased the cost of digital hardware, and its speed has increased to such an extent that digital signal processing has replaced a great deal of analog signal processing. This thesis presents a digital-domain parallel-pipelined architecture capable of computing the DOA of multiple broad-band sources in real-time. Broad-Band Signal-Subspace Spatial-Spectrum (BASS-ALE) Estimation algorithm has been selected for DOA estimation and has been simulated and verified through computer software programs. The BASS-ALE algorithm has been modified and parallelized. The parallel algorithm has been mapped on an architecture which is suitable for real-time computation. DTIC

A GENERAL THEORY OF SIGNAL INTEGRATION FOR FAULT-TOLERANT DYNAMIC DISTRIBUTED SENSOR NETWORKS Research Summary Report
S. S. Iyengar and B. J. Jones 1 Oct. 1993 8 p
(Contract N00014-91-J-1306)
(AD-A270316) Avail: CASI HC A02/MF A01

The computational issues related to information integration in multisensor systems and distributed sensor networks has become an active area of research. In recent years, a number of significant advances in the field of sensor integration have been made. This interest in the development of Distributed Sensor Networks (DSN's) for information gathering has partly emerged because of the availability of new technology which makes the DSNs economically feasible to implement and the increasing complexity of today's information gathering tasks to which they are applied. From a computational veiwpoint, the efficient extraction of information from noisy and fault signals emanating from many sensors requires the solution of problems related to (1) the architecture and fault-tolerance of the distributed sensor network, (2) the proper synchronisation of sensor signals, (3) the integration of information to keep the communication and the processing requirements small, and (4) the design of efficient computational techniques to abstractly represent and integrate sensor information. IMPLEMENTATION OF ELECTRONIC DATA INTERCHANGE IN THE DEPARTMENT OF DEFENSE: LESSONS LEARNED FROM PRIVATE INDUSTRY M.S. Thesis
Robert B. Turner 1 Jun. 1993 123 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A269532) Avail: CASI HC A06

The Department of Defense (DoD) has emphasized Electronic Data Interchange (EDI) since 1988 when the Deputy Secretary of Defense issued a policy directive that EDI was to become 'the way of doing business' for DoD in the future. The focus of this research is on how private industry is implementing EDI, and specifically how EDI is being used in the procurement and acquisitions environment. The results from a survey of private industry showed that EDI use will continue to grow in the procurement environment and that most impediments to EDI will be resolved with time and experience;

EDI must be adopted by the critical mass before the full benefits and savings will be recognized by DoD and industry; top level management support and a detailed, well thought out strategic EDI plan are mandatory for successful implementation of EDI; and the transaction sets currently being used by private industry for procurements and acquisitions limit DoD EDI opportunities for large purchases. Recognizing these conclusions, recommendations to DoD are then presented. DTIC

OPTIMAL EIGENVALUE COMPUTATION ON DISTRIBUTED-MEMORY MIMD MULTIPROCESSORS
S. Crivelli and E. R. Jessup Oct. 1992 20 p Presented at the 6th Society for Industrial and Applied Mathematics Conference on Parallel Processing for Scientific Computing, Norfolk, VA, 21-24 Mar. 1993
(Contracts DE-FG02-92ER-25122; DE-AC05-84OR-21400)
(DE93-018337; DOE/ER-25122/4; CU-CS-617-92; CONF-930331-14)
Avail: CASI HC A03/MF A01

Simon proves that bisection is not the optimal method for computing an eigenvalue on a single vector processor. In this paper, we show that his analysis does not extend in a straightforward way to the computation of an eigenvalue on a distributed-memory MIMD multiprocessor. In particular, we show how the optimal number of sections (and processors) to use for a multisection depends on variables such as the matrix size and certain parameters inherent to the machine. We also show that parallel multisection outperforms the variant of parallel bisection proposed by Swarztrauber or this problem on a distributed-memory MIMD multiprocessor. We present the results of experiments on the 64-processor Intel iPSC/2 hypercube and the 512-processor Intel Touchstone Delta mesh multiprocessor. DOE

This effort produced an approach for developing software for parallel processing systems based on the parallel object-oriented functional computational model (PROOF). A benefit of this approach is that it allows the software development to be separated from architecture dependent issues to a great degree. For example, the programmers do not need to be concerned with issues such as synchronization, parallelization, or the topology of the parallel processing system when they address objects in the system. The object-oriented paradigm reflects the parallel structure of the problem space and can represent inherently concurrent behavior. This approach is suitable for MIMD machines and should result in software that is more understandable, modifiable, and portable over a variety of parallel computer architectures. DTIC

The Parallel Evaluation and Experimentation Platform (PEEP) is the result of an effort at Rome Laboratory to identify the most promising general-purpose software development tools, techniques, and approaches from industry and academia for programming high performance parallel computers to meet the needs of command and control (C2) applications. The PEEP is a prototype platform for evaluating the applicability of results from parallel programming research efforts to improve the productivity of designers and developers. Intermetrics conducted a study of available innovative tools and techniques beginning in early 1990. From the survey, Intermetrics chose candidates for inclusion on a prototype platform and began to install and evaluate the chosen components. With the prototype PEEP, a number of case studies were conducted to develop small parallel programs using the selected tools. The purpose of these case studies was not to advance the state of the art in parallel algorithms, but to exercise the tools collected for the prototype PEEP. This work identified requirements on architectures, life cycle activities, and technologies to support parallel development. DTIC

COMPUTER/INFORMATION SECURITY DESIGN APPROACHES FOR COMPLEX 21/RECONFIGURATION FACILITIES
W. J. Hunteman, N. R. Zack, and C. D. Jaeger (Sandia National Labs., Albuquerque, NM.) 1993 8 p Presented at the 34th Annual Meeting of the Inst. of Nuclear Materials Management, Scottsdale, AZ, 18-21 Jul. 1993
(Contract W-7405-eng-36)
(DE93-018547; LA-UR-93-2585; CONF-930749-39) Avail: CASI HC A02/MF A01

Los Alamos National Laboratory and Sandia National Laboratories have been designated the technical lead laboratories to develop the design of the computer/information security, safeguards, and physical security systems for all of the DOE Complex 21/Reconfiguration facilities. All of the automated information processing systems and networks in these facilities will be required to implement the new DOE orders on computer and information security. The planned approach for a highly integrated information processing capability in each of the facilities will require careful consideration of the requirements in DOE Orders 5639.6 and 1360.2A. The various information protection requirements and user clearances within the facilities will also have a significant effect on the design of the systems and networks. Fulfilling the requirements for proper protection of the information and compliance with DOE orders will be possible because the computer and information security concerns are being incorporated in the early design activities. This paper will discuss the computer and information security addressed in the integrated design effort for the tritium, uranium/lithium, plutonium, plutonium storage, and high explosive/assembly facilities. EARLY EXPERIENCES WITH THE IBM SP-1
W. Gropp, ed. Jun. 1993 18 p
(Contract W-31-109-eng-38)
(DE93-018398; ANL/MCS-TM-177) Avail: CASI HC A03/MF A01

The IBM SP-1 is IBM's newest parallel distributed-memory computer. As part of a joint project with IBM, Argonne took delivery of an early system in order to evaluate the software environment and to begin porting programming packages and applications to this machine. This report discusses the results of those early efforts. Despite the newness of the machine and the lack of a fast interprocessor switch (part of the SP-1 but not yet available for the machine), every code that they attempted to port ran on the SP-1 with little or no modification. The report concludes with a discussion of expectations for the fast interconnect. DOE

THE p4 LINDA: A PORTABLE IMPLEMENTATION OF LINDA
Ralph M. Butler (University of North Florida, Jacksonville.), Alan L. Leveton (University of North Florida, Jacksonville.), and Ewing L. Lusk 1993 9 p Presented at the 2nd International Symposium on High-Performance Distributed Computing, Spokane, WA, 20-23 Jul. 1993
(Contract W-31-109-eng-38; NSF CCR-91-21875)

(DE93-017752; ANL/MCS/CP-80307; CONF-9307111) Avail: CASI HC A02/MF A01

Facilities such as interprocess communication and protection of shared resources have been added to operating systems to support multiprogramming and have since been adapted to exploit explicit multiprocessing within the scope of two models: the shared-memory model and the distributed (message-passing) model. When multiprocessors (or networks of heterogeneous processors) are used for explicit parallelism, the difference between these models is exposed to the programmer. The p4 tool set was originally developed to buffer the programmer from synchronization issues while offering an added advantage in portability, however two models are often still needed to develop parallel algorithms. We provide two implementations of Linda in an attempt to support a single high-level programming model on top of the existing paradigms in order to provide a consistent semantics regardless of the underlying model. Linda's fundamental properties associated with generative communication eliminate the distinction between shared and distributed memory. DOE

PERFORMANCE AND SCALABILITY ASPECTS OF DIRECTORY-BASED CACHE COHERENCE IN SHARED-MEMORY MULTIPROCESSORS

S. Picano (Purdue Univ., West Lafayette, IN.), D. G. Meyer (Purdue Univ., West Lafayette, IN.), E. D. Brooks, III, and J. E. Hoag May 1993 6 p Presented at the 22nd Annual International Conference on Parallel Processing, University Park, PA, 16-20 Aug. 1993
(Contract W-7405-eng-48)
(DE93-016442; UCRL-JC-113858; CONF-9308129-1) Avail: CASI HC A02/MF A01

We present a study that accentuates the performance and scalability aspects of directory-based cache coherence in multiprocessor systems. Using a multiprocessor with a software-based coherence scheme, efficient implementations rely heavily on the programmer's ability to explicitly manage the memory system, which is typically handled by hardware support on other bus-based, shared memory multiprocessors. We describe a scalable, shared memory, cache coherent multiprocessor and present simulation results obtained on three parallel programs. This multiprocessor configuration exhibits high performance at no additional parallel programming cost. DOE

A MASSIVELY PARALLEL ADAPTIVE FINITE ELEMENT METHOD WITH DYNAMIC LOAD BALANCING

K. D. Devine, J. E. Flaherty, S. R. Wheat, and A. B. Maccabe (New Mexico Univ., Albuquerque.) 1993 26 p Presented at the Supercomputing Conference on High Performance Computing and Communications, Portland, OR, 15-19 Nov. 1993
(Contract DE-AC04-76DP-00789)
(DE93-012844; SAND-93-0936C; CONF-931115-2) Avail: CASI HC A03/MF A01

We construct massively parallel, adaptive finite element methods for the solution of hyperbolic conservation laws in one and two dimensions. Spatial discretization is performed by a discontinuous Galerkin finite element method using a basis of piecewise Legendre polynomials. Temporal discretization utilizes a Runge-Kutta method. Dissipative fluxes and projection limiting prevent oscillations near solution discontinuities. The resulting method is of high order and may be parallelized efficiently on MIMD computers. We demonstrate parallel efficiency through computations on a 1024-processor nCUBE/2 hypercube. We also present results using adaptive p-refinement to reduce the computational cost of the method. We describe tiling, a dynamic, element-based data migration system. Tiling dynamically maintains global load balance in the adaptive method by overlapping neighborhoods of processors, where each neighborhood performs local load balancing. We demonstrate the effectiveness of the dynamic load balancing with adaptive p-refinement examples. DOE

EXPERIENCE IN IMPLEMENTING A PARALLEL FILE SYSTEM

R. Riesen, A. B. Maccabe, and S. R. Wheat Mar. 1993 23 p Presented at the Supercomputing Conference on High Performance Computing and Communications, Portland, OR, 15-19 Nov. 1993
(Contract DE-AC04-76DP-00789)
(DE93-012840; SAND-93-0934C; CONF-931115-4) Avail: CASI HC A03/MF A01

With ever increasing processor and memory speeds, new methods to overcome the 'I/O bottleneck' need to be found. This is especially true for massively parallel computers that need to store and retrieve large amounts of data fast and reliably to fully utilize the available processing power. We have designed and implemented a parallel file system that distributes the work of transferring data to and from mass storage across several I/O nodes and communication channels. The prototype parallel file system makes use of the existing single threaded file system of the Sandia/University of New Mexico Operating System (SUNMOS). SUNMOS is a joint project between Sandia National Laboratory and the University of New Mexico to create a small and efficient OS for Massively Parallel (MP) Multiple Instruction, Multiple Data (MIMD) machines. We chose file striping to interleave files across sixteen disks. By using source-routing of messages, we were able to increase throughput beyond the maximum single channel bandwidth the default routing algorithm of the nCUBE 2 hypercube allows. We describe our implementation, the results of our experiments, and the influence this work has had on the design of the Performance-oriented, User-managed, Messaging Architecture (PUMA) operating system, the successor to SUNMOS. ACOS: A PERFORMANCE BASED APPROACH TO BUILD A PARALLEL COMPLEX OBJECT SERVER

Wouter B. Teeuw, Maarten Klein, and Henk M. Blanken Jan. 1993 29 p Sponsored in part by Netherlands Foundation for Computer Science
(Memo-INF-93-11; ETN-93-94685) Copyright Avail: CASI HC A03/MF A01

The design and implementation of a complex object server for the distributed operating system Amoeba are described. The server is called ACOS (Amoeba Complex Object Server). In order to meet the requirements of non standard, database environments, a complex object server has to provide a high performance. The desire to control the expected performance of ACOS during its design is shown. By using a topdown design/implementation method, in which a simulation model is evolved into a real system by gradual addition of detail, it is required to detect performance bottlenecks in an as early stage as possible. In this way an optimal physical design for ACOS is expected. Measurements with a simple Wisconsin join in the current implementation of ACOS support the strength of the approach. ESA

MESSAGE PASSING IN PUMA

Arthur B. Maccabe (New Mexico Univ., Albuquerque.) and Stephen R. Wheat 1993 26 p Presented at the Supercomputing Conference on High Performance Computing and Communications, Portland, OR, 15-19 Nov. 1993
(Contract DE-AC04-76DP-00789)
(DE93-012841; SAND-93-0935C; CONF-931115-5) Avail: CASI HC A03/MF A01

This paper provides an overview of the message passing primitives provided by PUMA (performance-oriented, user-managed messaging architecture). Message passing in PUMA is based on the concept of a portal--an opening in the address space of an application process. Once an application process has established a portal, other processes can write values into the memory associated with the portal using a simple send operation. Because messages are written directly into the address space of the receiving process, there is no need to buffer messages in the PUMA kernel. This simplifies the design of the kernel, increasing its reliability and portability. Moreover, because messages are mapped directly into the address space of the application process, the application can manage the messages that it receives without needing direct support from the kernel. DOE

WIDE-ADDRESS SPACES: EXPLORING THE DESIGN SPACE

Alberto Bartoli (Pisa Univ., Italy.), Martijn vanderValk, and Sape J. Mullender Dec. 1992 13 p
(Memo-INF-92-77; Pegasus-Paper-92-3; ETN-93-94668) Copyright Avail: CASI HC A03/MF A01

In a recent issue of Operating System Review, Hayter and McAuley argue that future high performance systems trade a traditonal, bus-based organization for one where all components are linked together by network switches (the Desk Area Network (DAN)). In this issue of Operating System Review, Leslie, McAuley, and Mullender conclude that DAN based architectures allow the exploitation of shared memory on a wider scale than just a single (multi)processor. A study which explores how emerging 64 bit processors can be used to implement shared address spaces spanning multiple machines is presented. The study is the third paper of the Esprit Pegasus project which is aimed at the design of an operating system architecture for scalable distributed multimedia systems. ESA

A VISUALIZATION ENVIRONMENT FOR SUPERCOMPUTING-BASED APPLICATIONS IN COMPUTATIONAL MECHANICS

C. J. Pavlakos, L. A. Schoof, and J. F. Mareda 1993 19 p Presented at the Supercomputing Conference on High Performance Computing and Communications, Portland, OR, 15-19 Nov. 1993
(Contract DE-AC04-76DP-00789)
(DE93-015024; SAND-93-0917C; CONF-931115-7) Avail: CASI HC A03/MF A01

In this paper, we characterize a visualization environment that has been designed and prototyped for a large community of scientists and engineers, with an emphasis in superconducting-based computational mechanics. The proposed environment makes use of a visualization server concept to provide effective, interactive visualization to the user's desktop. Benefits of using the visualization server approach are discussed. Some thoughts regarding desirable features for visualization server hardware architectures are also addressed. A brief discussion of the software environment is included. The paper concludes by summarizing certain observations which we have made regarding the implementation of such visualization environments. VECTORIZED PRESENTATION-LEVEL SERVICES FOR SCIENTIFIC DISTRIBUTED APPLICATIONS

L. C. Stanberry, M. L. Branstetter, and D. M. Nessett Mar. 1993 9 p Presented at the Supercomputing Conference on High Performance Computing and Communications, Portland, OR, 15-19 Nov. 1993
(Contract W-7405-eng-48)
(DE93-018091; UCRL-JC-113319; CONF-931115-10) Avail: CASI HC A02/MF A01

The use of heterogeneous distributed systems is a promising approach to significantly increase computational performance of scientific applications. However, one key to this strategy is to minimize the percentage of time spent by an application moving data between machines. This percentage is composed of two parts: the time to translate data between the formats used on different machines, and the time to move data over the network that interconnects the machines. Previous work suggests that data format conversion activity, generally known as presentation-level services, is by far the more costly of the two. In this paper the authors describe how vectorization can be used to improve presentation-level performance in scientific applications by one or two orders of magnitude over the conventional approach. While others have recognized the advantages of vectorized data format conversion, the authors describe how to automate this process so that an application programmer need not explicitly call vectorization routines. The impact of presentation-level vectorization on software portability, programming efficiency, and protocol standards is explored. Performance results are compared with those of two other popular distributed application programming tools and the lessons learned during the course of the research are summarized. DOE

A UNIFIED PERFORMABILITY EVALUATION FRAMEWORK FOR COMPUTER AND COMMUNICATION SYSTEMS

Aad P. A. vanMoorsel and Boudewijn R. Haverkort 1993 21 p Submitted for publication
(Memo-INF-93-21; TIOS-93-12; ETN-93-94693) Copyright Avail: CASI HC A03/MF A01

A unified approach towards model based quantitative evaluation of both computer systems and communication systems is presented. In the area of fault tolerant computer systems, dependability evaluation has been recognized as being a topic of importance, both to judge a system on its merits and to provide trust in the actual dependability of the system. In communication systems, the need for identifying and evaluating quality of service parameters is becoming more and more apparent because of increasing demands on for instance speed and availability. The construction of a framework, the so called performability evaluation framework, within which the quantitative evaluation of both types of systems can be discussed is shown. A general view, a system view, and a modeling view on performability evaluation, leading to a framework which naturally fits known measure definitions, modeling methods, and solution techniques are given. The performability evaluation framework is related with known concepts in both the areas of computer and communication systems. ESA

ACTION SYSTEMS AND ACTION REFINEMENT IN THE DEVELOPMENT OF PARALLEL SYSTEMS: AN ALGEBRAIC APPROACH
Wil Janssen, Mannes Poel, and Job Zwiers Feb. 1993 74 p Sponsored in part by Commission of the European Communities
(Memo-INF-93-14; ETN-93-94688) Copyright Avail: CASI HC A04/MF A01

A notion of refinement and several other operators that allow for a compositional algebraic characterization of action systems and serializability in distributed database systems are proposed. A simple design language is introduced and is provided with a semantics essentially based on partial order models. Various algebraic transformation rules are introduced. They are applied in the design process of a simple system, starting from a specification of functional behavior via the intermediate step in the form of a 'true concurrency' based initial design to an actual implementation on a two processor architecture. PUMMA: PARALLEL UNIVERSAL MATRIX MULTIPLICATION ALGORITHMS ON DISTRIBUTED MEMORY CONCURRENT COMPUTERS
Jae-Young Choi, D. W. Walker, and J. J. Dongarra (Tennessee Univ., Knoxville.) Aug. 1993 39 p
(Contract DE-AC05-84OR-21400)
(DE93-019163; ORNL/TM-12252) Avail: CASI HC A03/MF A01

This paper describes the Parallel Universal Matrix Multiplication Algorithms (PUMMA) on distributed memory concurrent computers. The PUMMA package includes not only the non-transposed matrix multiplication routine C = A(center dot)B, but also transposed multiplication routines C = A(sup T)(center dot)B, C = A(center dot)B(sup T), and C = A(sup T)(center dot)B(sup T), for a block scattered data distribution. The routines perform efficiently for a wide range of processor configurations and block sizes. The PUMMA provides the same functionality as the Level 3 BLAS routine xGEMM. Details of the parallel implementation of the routines are given, and results are presented for runs on the Intel Touchstone Delta computer. DOE

PROCESS ALLOCATION ON DISTRIBUTED MEMORY PARALLEL ARCHITECTURES Ph.D. Thesis [ALLOCATION DE PROCESSUS SUR LES ARCHITECTURES PARALLELES A MEMOIRE DISTRIBUEE]
El-Ghazali Talbi 1993 197 p In FRENCH
(ETN-93-95004) Avail: CASI HC A09/MF A03

The static allocation problem on a static architecture is considered. An original approach based on genetic algorithms was used to solve this problem. A massively parallel genetic algorithm was proposed, evaluated and integrated in a parallel system. A comparative study with hill climbing algorithms and simulated annealing gives encouraging results in favor of genetic algorithms. In the case of reconfigurable architectures, the allocation goes with the definition of the best configuration adapted to the program. This problem was treated in two steps. In the first one clusters of processes are made to obtain a graph with a number of its nodes equal to the number of processors. This problem may be reduced to a graph partitioning problem. The second step carries out an edge deletion to obtain a graph with a degree inferior to the number of physical links per processor. This problem may be reduced to the maximum c matching of a graph. For dynamic programming models, a dynamic allocation is unavoidable. An algorithm independent of the size and the topology of the network was proposed. The algorithm that is presented is distributed, dynamic, stable, non preemptive and simple. A simulation program to evaluate the algorithm was implemented on a transputer network and preliminary results are presented. ESA

PROTOCOL SERVICE DECOMPOSITION FOR HIGH-PERFORMANCE NETWORKING
Chris Maeda and Brian N. Bershad Mar. 1993 16 p
(Contract MDA972-90-C-0035; ARPA Order 7330)
(AD-A270613; CMU-CS-93-131) Avail: CASI HC A03/MF A01

In this paper the authors describe a new approach to implementing network protocols that enables the network to have high performance and high flexibility, while retaining complete conformity to existing application programming interfaces. The key insight behind the work is that an application's interface to the network is distinct and separable from its interface to the operating system. The authors have separated these interfaces for two protocol implementations, TCP/IP and UDP/IP, running on the Mach 3.0 operating system and UNIX server. Specifically, library code in the application's address space implements the network protocols and transfers data to and from the network, while an operating system server manages the heavy-weight abstractions that applications use when manipulating the network through operations other than send and receive. On DECstation 5000/200 systems connected by 10Mb/sec Ethernet, this approach to protocol decomposition achieves TCP/IP throughput of 1088 KB/second, which is comparable to that of a high-quality in-kernel TCP/IP implementation, and substantially better than a server-based one. The approach achieves small-packet UDP/IP round trip latencies of 1.23 ms, again comparable to a kernel-based implementation and more than twice as fast as a server-based one. DTIC

A NON-HOMOGENEOUS, SPATIO-TEMPORAL, WAVELET MULTIRESOLUTION ANALYSIS AND ITS APPLICATION TO THE ANALYSIS OF MOTION Ph.D. Thesis
Thomas J. Burns Dec. 1993 183 p
(AD-A270621; AFIT/DS/ENG/93D-12) Avail: CASI HC A09/MF A02

This research presents a multiresolution wavelet analysis tool for analyzing motion in time sequential imagery. A theoretical framework is developed for constructing an L(sub 2)(R(sup 3)) wavelet multiresolution analysis from three non-identical spatial and temporal L(sub 2)(R) wavelet multiresolution analyses. This framework provides the flexibility to tailor the spatio-temporal frequency characteristics of the three dimensional wavelet filter to match the frequency behavior of the analyzed signal. An unconventional, discrete multiresolution wavelet decomposition algorithm is developed which yields a rich set of independent spatio-temporally oriented frequency channels for analyzing the size and speed characteristics of moving objects. Unlike conventional wavelet decomposition methods, this algorithm provides independent zoom-in and zoom-out capability in space and time. Symmetric 3D filters produced by the unconventional decomposition process are combined with the properties of the Hilbert transform to produce a bank of directionally selective wavelet filters. Multiple directionally selective wavelet filters are integrated to form a multiresolution vector wavelet motion sensor capable of unambiguously computing the optical flow of a 3D image sequence. A unique flow restoration methodology is presented which incorporates a modified version of Grossberg's gated dipole filter in a cooperative-competitive flow restoration methodology that reinforces consistent flow behavior and removes flow inconsistencies. Finally, several digital and optical parallel architectures are investigated for their ability to speed up the 3D wavelet decomposition process. DTIC

A MULTI-LEVEL DATA-FLOW ARCHITECTURE FOR SIGNAL AND DATA PROCESSING APPLICATIONS
J. L. Gaudiot 2 Sep. 1993 6 p
(Contract DE-FG03-87ER-25043)
(DE93-041272; DOE/ER-25043/T1) Avail: CASI HC A02/MF A01

A grant was awarded to us by the Department of Energy, Office of Energy Research, in May 1987 to support the design and performance analysis of a large grain data-driven multiprocessor system for numerical applications. The basic idea of the work is to apply the data-driven principles of execution at a more appropriate level than conventional 'atomic' instructions. For this purpose, a level such as that of vector operations was under study. This document represents the final report concerning the results of the research supported by this grant. The goals of the project entailed an analysis of Partial Differential Equation solvers in data-driven environments, a preliminary design of our multi-level architecture, an in-depth study of some of the mechanisms of execution, and a design of the software environment. As enumerated in the original proposal, our work has yielded results in three different domains: specifications of the application programs; design of the general concepts of the architecture and simulation; and implementation of a translating environment. We discuss each of the above items and examine specific research results. DOE

(Contract N00014-91-J-1985)
(AD-A271035) Avail: CASI HC A03/MF A01

This dissertation develops fast algorithms for solving closest point problems on parallel and vector computers. Algorithms for such problems have applications in many areas including statistical classification, crystallography, data compression, and finite element analysis. We present a simple and flexible programming model for designing and analyzing parallel algorithms. Also, fast parallel algorithms for nearest-neighbor searching and constructing Voronoi diagrams are described. Finally, we demonstrate that the algorithms actually obtain good performance on a wide variety of machine architectures, including the MasPar MP-1, Cray Y-MP, and KSR-1 supercomputers. DTIC

A distributed data acquisition system (DAQ) should not restrict the number or type of processors used in a given application. For any software application that must operate on a multi-vendor distributed system, three serious problems have to be addressed regarding data handling: data representation, memory organization, and address alignment. Data representation, memory organization, and address alignment problems are inherent in the various hardware platforms available on the market today. Furthermore, issues such as how to coordinate parallel software efforts on multiple platforms that share data must be resolved. Traditionally such efforts are coordinated through meetings, memos, and documents describing shared data blocks (Data Interface Documents). The traditional approach is risky at best: the frequency of changes demanded by end-users is faster than the rate at which interface documents can be updated. Simple changes in data structures tend to dramatically increase the software development time, as all the tools must be modified to accommodate the changes. In Section 2.0 the authors examine in detail the technical implications for data handling when using distributed applications. In Section 3.0 they compare different approaches in handling the data in distributed environments. The four methods studied are: abstract syntax notation 1 (ASN.1), external data representation (XDR), self describing data format (SDS), and ZEBRA. They compared the four tools with the standard programming method (using 'C'). In Section 4.0 they present conclusions of the test using the four different tools. DOE

NPAC DISTRIBUTED-PARALLEL SYSTEM FEASIBILITY STUDY Final Report, Sep. 1990 - 1991
Nancy McCracken, Gary Craig, Don Hewitt, and Kanchana Parasuram Aug. 1993 23 p
(Contract F30602-88-D-0025)
(AD-A270972; RL-TR-93-164) Avail: CASI HC A03/MF A01

A distributed-parallel computing testbed, comprised of two shared-memory multiprocessors linked by a wide-area network was established. A missile-tracking simulator application was implemented on this testbed for the purposes of evaluating the feasibility of distributed-parallel computing. Several scenarios were run and performance data collected for each of four computing modes. Preliminary evaluation of the software model and analysis of the scenario performance data are presented. THE DESIGN OF THE MAD DESIGN PROGRAM
J. Niederer 1992 22 p Presented at the Stability of Particle Motion in Storage Rings, Upton, NY, 18-24 Oct. 1992 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-AC02-76CH-00016)
(DE93-013343; BNL-48790; CONF-921077-4) Avail: CASI HC A03

The study of long term stability in particle accelerators has long been served by a group of widely circulated computer programs. The progress in these programs has mirrored the growth and versatility in accelerator size, complexity, and purpose, as well as evolving technologies in computing software and hardware. A number of large accelerator projects during the last decade were designed with the aid of physics programs either written for, or tailored for the project at hand, each invariably benefiting from contributions of previous workers. This paper outlines the recent history of an example of an accelerator lattice model tool kit, the Methodical Accelerator Design (MAD) Program, which has tried to knit together this collective wisdom of the accelerator community. The ideas behind the software design of the program itself are traced here; the accelerator physics contents and origins are thoroughly documented elsewhere. These informal notes have a Brookhaven flavor, in part because of early BNL efforts to generalize the ways that technical problems are organized and presented to computers. Some recent BNL applications not covered in the extensive CERN documentation are also included. DOE

A STRUCTURED APPROACH FOR MODELING, ANALYZING AND SIMULATING REAL-TIME CONTROL SYSTEMS
Alberto Leva, Eva Locatelli (Master School CEFRIEL, Milan, Italy.), and Riccardo Scattolini 1993 19 p
(Rept-93-044; ETN-93-94901) Avail: Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy

A methodology for the development of real time control software is presented. Specifically, this approach can aid the designer in the phase of tailoring a given control scheme on a target hardware/firmware architecture. The methodology is composed of three steps: the overall system, that is the control apparatus and the control software, is modeled with the formalism of Petri Nets; analysis tools are then applied to verify the correctness of the model in terms of absence of deadlocks and fulfilment of time constraints; a simulation environment is described and employed to assess the performance of the design. Focus is on the first and the third items above, since well stated methods and software tools are available for the second one. An application example is reported to illustrate the effectiveness of the proposed approach. ESA

ON COMPARISON AND EXTENSIONS OF CONTROL METHODS FOR NARROW-BAND DISTURBANCE REJECTION

Giuseppe DeNicolao (Pavia Univ., Italy.), Fabrizio Lorito, and Silvia Strada 1993 10 p Sponsored in part by CNR, and Ministry of University and Scientific Research and Technology
(Rept-93-015; ETN-93-94519) Avail: Politecnico di Milano, Piazza Leonardo da Vinci 32, 20133 Milan, Italy

Several control methods for the rejection of narrowband disturbances were recently surveyed. In particular, a method, called Disturbance Modeling (DM), which is a Linear Quadratic (LQ) optimization technique hinging on a state space model of the disturbance was introduced. A demonstration that the DM design methodology proposed recently leads to an unsolvable optimizaton problem is presented. It is also suggested how to modify the LQ cost functional in order to obtain an effective DM disturbance rejection scheme. Duality between DM and the approach based on shaped cost functional is discussed. ESA

GENERALIZATION OF OPTIMAL CONTROL THEORY: LINEAR AND NONLINEAR STRUCTURES

J. N. Yang, Z. Li, and S. Vongchavalitkul 2 Nov. 1992 89 p Sponsored by National Center for Earthquake Engineering Research
(Grants NSF BCS-90-25010; NEC-91029)
(PB93-188621; NCEER-92-0026) Avail: CASI HC A05/MF A01

A systematic generalization of the theory of optimal control for seismic-excited linear, nonlinear, and hysteretic structures is presented. The generalized theory includes the effect of actuator dynamics and a penalty on the acceleration response of the structure. The proposed generalized performance index includes the acceleration response so that either a simultaneous reduction of the deformation and acceleration or a trade-off between them can be achieved. Experimental results indicate that a significant contribution to the system time delay comes from the actuator response. In the report, the actuator dynamics is explicitly accounted for in the optimization process so that the gain matrix involves actuator characteristics leading to a better control performance. In Part 1, optimal control theory for linear structures is presented. Numerical simulation results are obtained to demonstrate the advantages of the generalized optimal control theory. In Part 2, an optimal nonlinear control method is proposed for applications to nonlinear and hysteretic structures. NTIS

APPLICATION OF THE NETWORK DISCRIMINANT FUNCTION TO LEARNING Interim Report, Jan. - Jun. 1993

Devert Wicker Jun. 1993 33 p
(AD-A268793; WL-TR-93-1086) Avail: CASI HC A03/MF A01

This introduces methods of applying the Network Discriminant Function (NDF) to training and automatic architecture selection of feed-forward multiple layer perceptrons (MLP's) used for Pattern Recognition (PR). Knowledge of the NDF may be used to impact MLP architecture choices. The NDF gives a new insight into MLP performance in that it reflects how well the MLP is clustering the data. If clustering is an intrinsic capability of the MLP which makes it perform well, then the NDF should correlate with other performance measures such as the Sum Squared Error. Architecture choices and training technique need to be selected as to aid the clustering ability of the MLP. The major goals of the research are to establish the NDF as a useful criteria and to compare it to other criteria such as Cascade-Correlation's error correlation. The NDF-Cascade (NDFC) learning architecture and the MLP NDF are proposed, tested, and evaluated. DTIC

DIALOG-BASED LEARNING (DBL) FOR ADAPTIVE INTERFACE AGENTS AND PROGRAMMING-BY-DEMONSTRATIONS SYSTEMS Research Report

Siegfried Bocionek and Michael Sassin (Massachusetts Inst. of Tech., Cambridge.) Jul. 1993 54 p Sponsored by Siemans AG, Corporate Research and Development, Munich, Germany
(AD-A269154; CMU-CS-93-175) Avail: CASI HC A04/MF A01

Many users of workstation and PC tools often have to perform the same task again and again. For example, a secretary might have to send out a dozen e-mail messages until she finds a free meeting room. Or someone preparing business charts has to draw many special tables with shadowing bars around. Unfortunately, today's macro-facilities of such tools do not support the end user enough in constructing the required automation functions. We propose a mechanism, called dialog-based learning (DBL), that provides the user of software tools exactly with a mechanism to teach new functions or to give hints or additional information to a program on how to perform a task better. Two applications will be considered. The first one is our experimental system RAP, a room reservation apprentice that will eventually overtake a secretary's task to search for a free meeting or lecture room. RAP analyzes the outgoing and incoming e-mail and constructs a finite state machine that can repeat the task of asking all room administrators until a free room is found. The key of RAP's learning is to ask the user for unknown message types (e.g., request, positive answer, etc.) and key-phrases (e.g., 'need a room') and to collect them in a thesaurus. Our second application is a demonstrational graphics editor that allows the user to teach it new functions by giving a few examples. DTIC

FAST-TRAINING ALGORITHM FOR HIDDEN-LAYER FORWARD-FEED NEURAL NETWORKS Summary Report, Mar. 1990 - 1992

Shawn D. Pethel, Charles M. Bowden, and Chi C. Sung Jun. 1993 27 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A269253; AD-E952096; AMSMI/TR-RD-WS-93-5) Avail: CASI HC A03

A new training algorithm, based on the matrix pseudoinverse method, is shown to train hidden-layer, forward-feed neural networks with high accuracy in a short time for nonlinear time series prediction. The algorithm is applied to chaotic time series generated from the logistics map and the Mackey-Glass delay differential equation and compared to corresponding results generated using a backpropagation training algorithm. We demonstrate orders of magnitude shorter training time and comparable accuracy with the new algorithm and show forecasting and self-generation for these systems. DTIC

AUTONOMOUS NEURAL NETWORK CONTROLLERS FOR ADAPTIVE MATERIAL HANDLING Final Report

James Kottas and Michael Kuperstein 30 Jul. 1993 27 p
(Contract N00014-91-C-0258)
(AD-A268908) Avail: CASI HC A03/MF A01

For robots to be more useful in flexible manufacturing and service applications, the controllers must be able to handle more variable environments. On at least two levels, conventional methods in robot control have problems dealing with high variability. At the current level, conventional dynamic control formulations cannot deal effectively with the highly variable dynamic inertial interactions between multijointed robots and payloads. At the task level, the initial and final positions for materials to be moved may change slightly but unexpectedly. We have developed autonomous neural network controllers that learn from their own experience to deal with environmental variability at these levels. DTIC

DISTRIBUTED REASONING AND PLANNING Final Report

Kurt G. Konolige 3 Aug. 1993 131 p
(Contract N00014-89-C-0095)
(AD-A268682) Avail: CASI HC A07/MF A02

This document describes research conducted by SRI International on the Office of Naval Research project Distributed Reasoning and Planning. A central focus in artificial intelligence (AI) research is the development of systems that are capable of reasoning about their environments and of planning appropriate courses of action to pursue. Yet for many applications, it is insufficient to rely on a single, autonomous system; instead, a network of physically distributed computer systems must be used. Each of those systems must itself have significant reasoning and planning capabilities, that is, it must be an intelligent agent in its own right. Research in distributed reasoning and planning is concerned with the development of a theoretical framework for designing, building, and managing networks of intelligent agents, which can plan in cooperation with one another to achieve given goals. ON MASKING EFFECT Research Report

Milind Tambe and Paul S. Rosenbloom Jul. 1993 14 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(Contract N00014-92-K-2015)

(AD-A269593; ISI/RR-93-349) Avail: CASI HC A03

Machine learning approaches to knowledge compilation seek to improve the performance of problem-solvers by storing solutions to previously solved problems in an efficient generalized form. The problem-solver retrieves these learned solutions in appropriate later situations to obtain results more efficiently. However, by relying on its learned knowledge to provide a solution, the problem-solver may miss an alternative solution of higher quality--one that could have been generated using the original (non-learned) problem-solving knowledge. This phenomenon is referred to as the masking effect of learning. In this paper, the authors examine a sequence of possible solutions for the masking effect. Each solution refines and builds on the previous one. The final solution is built on cascaded filters. When learned knowledge is retrieved, these filters alert the system about the inappropriateness of this knowledge so that the system can then derive a better alternative solution. The authors analyze conditions under which this solution will perform better than the others and present experimental data supportive of the analysis. This investigation is based on a simulated robot domain called Ground world. DTIC

FLEXIBLE INTEGRATION OF PATH-PLANNING CAPABILITIES Research Report

Iain C. Stobie, Milind Tambe, and Paul S. Rosenbloom Nov. 1992 13 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(Contracts N00014-91-J-1624; DABT63-91-C-0025)

(AD-A269594; ISI/RR-93-348) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Robots pursuing complex goals must plan paths according to several criteria of quality including shortness, safety, speed, and planning time. Many sources and kinds of knowledge, such as maps, procedures and perception, may be available or required. Both the quality criteria and sources of knowledge may vary widely over time, and in general they will interact. One approach to address this problem is to express all criteria and goals numerically in a single weighted graph, and then to search this graph to determine a path. Since this is problematic with symbolic or uncertain data and interacting criteria, we propose that what is needed instead is an integration of many kinds of planning capabilities. We describe a hybrid approach to integration, based on experiments with building simulated mobile robots using Soar, an integrated problem-solving and learning system. For flexibility, we have implemented a combination of internal planning, reactive capabilities, and specialized tools. We illustrate how these components can complement each other's limitations and produce plans which integrate geometric and task knowledge. DTIC

SURVEY OF COLLISION AVOIDANCE AND RANGING SENSORS FOR MOBILE ROBOTS, REVISION 1 Final Report

H. R. Everett, D. E. DeMuth, and E. H. Stitz Dec. 1992 155 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(AD-A269846; NCCOSC/RDT/E-1194-Rev-1) Avail: CASI HC A08/MF A02

The past few years have brought about a tremendous rise in the envisioned potential of robotic systems and a significant increase in the number of proposed applications. In the nonindustrial arena, numerous programs have evolved, each intending to harness some of this promise in hopes of solving some particular application need. Many of these efforts are government sponsored, aimed at the development of systems for fighting fires, handling ammunition, transporting materials, conducting underwater search and inspection operations, and patrolling warehouses and storage areas, etc. Many of the resulting prototypes, which were initially perceived as logical extensions of the traditional industrial robotic scenarios, have met with unexpected difficulty due to an insufficient supporting technology base. This document provides some basic background on the various noncontact distance measurement techniques available, with related discussion of implementation in the acoustical, optical, and electromagnetic portions of the energy spectrum. An overview of candidate systems, both commercially available and under development, is provided, followed by a brief summary of research currently underway in support of the collision avoidance and noncontact ranging needs of a mobile robot. AUTOMATICALLY GENERATING ABSTRACTIONS FOR PLANNING Research Report

Craig A. Knoblock Jun. 1993 62 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(Contract F30602-91-C-0081)

(AD-A269772; ISI/RR-93-344) Avail: CASI HC A04

This article presents a completely automated approach to generating abstractions for planning. The abstractions are generated using a tractable, domain-independent algorithm whose only input is the definition of a problem to be solved and whose output is an abstraction hierarchy that is tailored to the particular problem. The algorithm generates abstraction hierarchical dropping literals from the original problem definition. It forms abstractions that satisfy the ordered monotonicity property, which guarantees that the structure of an abstract solution is not changed in the process of refining it. The algorithm for generating abstractions is implemented in a system called ALPINE, which generates abstractions for a hierarchial version of the PRODIGY problem solver. The abstractions generated by ALPINE are tested in multiple domains on large problem sets and are shown to produce shorter solutions with significantly less search than planning without using abstraction. ACTIVE CONTROL OF A MULTIVARIABLE SYSTEM BY WAY OF POLYNOMIAL NEURAL NETWORKS: COMPUTER SIMULATION EVALUATIONS AND LABORATORY EXPERIMENTAL RESULTS Final Technical Report, 15 Apr. 1992 - 31 Mar. 1993

B. E. Parker, Jr., Natalie A. Nigro, and David G. Ward Jun. 1993 116 p

(Contract N00014-89-C-0137)

(AD-A270033; Rept-141-05-FTR) Avail: CASI HC A06/MF A02

The objective of the work described herein was to develop, implement, and demonstrate inductively synthesized active control algorithms that minimize a performance metric that is a function of a signal measured by a sensor external to a multivariable control system. The controller is required to control a (potentially nonlinear) plant when subjected to a broadband (impulsive) disturbance signal. Polynomial neural networks (PNN's) are used to implement the control algorithms. To provide controller/secondary feedback compensation filter parameters for the laboratory experiments, and to provide a benchmark with which to compare the empirical results, computer simulation evaluations were also conducted. The report documents controller designs that achieve up to 24.4 dB error improvement relative to the uncontrolled case. Key differences between the present work and that ongoing elsewhere in active control are as follows: (1) the use of broadband impulsive disturbances, which induce a more complex stochastic control scenario than that of narrowband excitation; and (2) the potential controller structures are adaptive, nonlinear, infinite impulse response PNN's, not traditional linear, finite impulse response filters. The former offer promising new active control approaches for non-Gaussian, as well as Gaussian, signals, and may be used for multiple-input, multiple-output control of unknown plants. DTIC

KNOWLEDGE SOURCES FOR AN INTELLIGENT MCM ANALYZER Final Technical Report, Jan. 1991 - Jan. 1992
Ian R. Grosse, Prasanna Katragadda, and Anagha Jog Jun. 1993 74 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F30602-92-C-0010)
(AD-A269224; RL-TR-93-123) Avail: CASI HC A04

This research project resulted in the development of: (1) an intelligent methodology for finite element modeling and analysis of multichip modules (MCM's) for the purpose of rapid mechanical reliability assessment; (2) specific software modules, termed MCM's; and (3) a prototype proof-of-concept computer-based system that integrated these knowledge sources. The approach featured an object-oriented representation of the MCM's and their components. The modeling and analysis methodology itself was represented by the blackboard problem-solving paradigm in which individual experts solve specific tasks involved in finite element modeling and analysis of MCM's and post their results on a common blackboard accessible by the other experts. Several software modules from Sandia National Laboratory were used as well as the contractor developing a three-dimensional thermal analysis finite element code, called FEECAP3D, which includes sophisticated techniques for estimating the finite element discretization error. All of these software codes were integrated into a blackboard-based proof-of-concept computer system called the Intelligent MCM Analyzer (IMCMA). DTIC

GEOMETRICAL PATTERN LEARNING
P. W. Goldberg Apr. 1993 13 p Presented at the 34th Meeting of the IEEE Foundation of Computer Science, Palo Alto, CA, 3-5 Nov. 1993
(Contract DE-AC04-76DP-00789)
(DE93-017641; SAND-93-1283C; CONF-931167-2-Extd-Abst) Avail: CASI HC A03/MF A01

In this paper, we consider the problem of learning the positions of spheres in metric spaces, given as data randomly drawn points classified according to whether they are internal or external to an unknown sphere. The particular metrics under consideration are geometrical shape metrics, and the results are intended to be applicable to the problem of learning to identify a shape from related shapes classified according to whether they resemble it visually. While it is typically NP-hard to locate a central point for a hypothesis sphere, we find that it is however often possible to obtain a non-spherical hypothesis which can accurately predict whether further random points lie within the unknown sphere. We exhibit algorithms which achieve this, and in the process indicate useful general techniques for computational learning. Finally, we exhibit a natural shape metric and show that it defines a class of spheres not predictable in this sense, subject to standard cryptographic assumptions. DOE

THE OPTIMAL PROJECTION EQUATIONS FOR FINITE-DIMENSIONAL FIXED-ORDER H2-OPTIMAL CONTROL OF INFINITE-DIMENSIONAL DISCRETE-TIME SYSTEMS
Florin Dan Barb and Willem L. deKoning 1993 22 p
(Rept-93-11; ETN-93-94638) Copyright Avail: CASI HC A03/MF A01

The fixed, finite order H squared optimal control of linear, infinite dimensional discrete time systems is addressed. The set of necessary conditions for the existence of the H squared optimal controller is expressed in terms of four operator equations (two modified Riccati equations and two modified Lyapunov equations) coupled by a projector having the rank given by the dimension of the compensator state. It is shown that, when the order to the compensator is equal to the order of the plant, the four operator equations are decoupled and the infinite dimensional generalization of the finite state space solution to the H squared optimal control problem for time varying systems is obtained. DEADBEAT CONTROL BY MEASUREMENT FEEDBACK: A TWO SIDED APPROACH
J. W. vanderWoude 1993 17 p
(Rept-93-20; ETN-93-94647) Copyright Avail: CASI HC A03/MF A01

A linear discrete time system is considered. Focus is on existence and design of a measurmeent feedback compensator such that in the closed loop system any initial state is forced to zero within a prescribed number of time steps. The so called two sided approach is followed and conditions for the existence of a compensator that achieves the required closed loop behavior are derived. With these conditions, an expression for the minimal number of time steps in which any initial state can be forced to zero by means of a measurement feedback compensator is given. A method of computing such a compensator having a reduced order is presented. ESA

ON ASYNCHRONOUS TESTING
Louis Verhaard (TFL, Hoersholm, Denmark.), Jan Tretmans, Pim Pars, and Ed Brinksma 1993 27 p Sponsored by part by EEC
(Memo-INF-93-03; TIOS-93-01; ETN-93-94677) Copyright Avail: CASI HC A03/MF A01

A test architecture influences the way a tester communicates with the Implementation Under Test (IUT), in particular, whether communication is synchronous or asynchronous. A study which shows that testers that communicate synchronously with the IUT can detect more differences between different implementations of the same specification than testers that communicate asynchronously is presented. It is shown that test cases derived to be used for synchronous testing give wrong results when used for asynchronous testing. To derive these results, systems are modeled by labeled transition systems. Synchronous communication is modeled by the synchronization operator on labeled transition systems; asynchronous communication is described by a queue operator that models a context consisting of a pair of queues, one for input of messages and one for output. Conformance is studied in the asynchronous context, and a method for test derivation is presented, together with a translation of the derived test cases to TTCN, the standardized test notation. ESA

DIGITAL CONTROL OF PRITCHARD-SALAMON SYSTEMS
Florin Dan Barb and Willem L. deKoning 1993 25 p
(Rept-93-33; ETN-94660) Copyright Avail: CASI HC A03/MF A01

The digital control problem of Pritchard-Salamon systems, optimal with respect to a quadratic cost function, is addressed. Both digital state feedback and output feedback control problems are investigated. It is shown that the digital control problem can be equivalent with a certain discrete time linear quadratic control problem, and the construction of the optimal control law is based on the solution to classical Riccati equations. ANALYSIS AND DESIGN OF ROBUST DECENTRALIZED CONTROLLERS FOR NONLINEAR SYSTEMS
D. A. Schoenwald Jul. 1993 155 p
(Contract DE-AC05-84OR-21400)
(DE93-019224; ORNL/TM-12181) Avail: CASI HC A08/MF A02

Decentralized control strategies for nonlinear systems are achieved via feedback linearization techniques. New results on optimization and parameter robustness of non-linear systems are also developed. In addition, parametric uncertainty in large-scale systems is handled by sensitivity analysis and optimal control methods in a completely decentralized framework. This idea is applied to alleviate uncertainty in friction parameters for the gimbal joints on Space Station Freedom. As an example of decentralized nonlinear control, singular perturbation methods and distributed vibration damping are merged into a control strategy for a two-link flexible manipulator. DOE

TANDEM QUEUES WITH DETERMINISTIC SERVICE TIMES
O. J. Boxma and J. A. C. Resing 1992 28 p Prepared in cooperation with Center for Mathematics and Computer Science, Amsterdam, Netherlands Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-197465; MEMO-COSOR-92-33) Avail: CASI HC A03

A tandem queueing model is considered for a sequence of multiplexers at the edge of an ATM network. All queues of the tandem queueing model have unit service times. Each successive queue receives the output of the previous queue plus some external arrivals. For the case of two queues in series, the authors study the end-to-end delay of a cell (customer) arriving at the first queue, and the covariance of its delays at both queues. The joint queue length process at all queues is studied in detail for the 2-queue and 3-queue cases, and the authors outline an approach to the case of an arbitrary number of queues in series. NTIS

COMPENSATION APPROACH FOR THREE OR MORE DIMENSIONAL RANDOM WALKS
G. J. VanHoutum, I. J. B. F. Adan, J. Wessels, and W. H. M. Zijm 1993 16 p See also PB93-197416
(PB93-197499) Avail: CASI HC A03/MF A01

The authors investigate for which random walks with three or more dimensions the compensation approach can be used to determine the equilibrium distribution. It is shown that the compensation approach is not appropriate for the symmetric shortest queue system with three queues, but for the 2 x 3 buffered switch it is. By using this compensation approach, it is shown that for the 2 x 3 buffered switch, the equilibrium distribution can be expressed as a linear combination of six series of binary trees of product-form (geometric) distributions. NONLINEAR DISTURBANCE DECOUPLING AND LINEARIZATION: A PARTIAL INTERPRETATION OF INTEGRAL FEEDBACK
H. J. C. Huijberts, H. Nijmeijer, and A. C. Ruiz Oct. 1992 34 p See also N89-23217 and N93-16474 Prepared in cooperation with Technische Univ., Twente, Netherlands Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-197515; MEMO-COSOR-92-41) Avail: Issuing Activity (National Technical Information Service (NTIS))

The relation between the solvability of the disturbance decoupling problem for a nonlinear system and its linearization around a working point is investigated. It turns out that generically the solvability of the disturbance decoupling via regular dynamic state feedback is preserved under linearization. The result gives a partial interpretation of introducing integral action in classical PID-control applied to nonlinear systems. The theory is illustrated by means of a worked example. NTIS

(PB93-197523; MEMO-COSOR-92-42; NASA-CR-194681; NAS 1.26:194681) Avail: CASI HC A03/MF A01

The paper is concerned with the discrete-time H(sub infinity) control problem with measurement feedback. The authors extend previous results by having weaker assumptions on the system parameters. The authors also show explicitly the structure of H(sub infinity) controllers. Finally, they show that it is in certain cases possible, without loss of performance, to reduce the dynamical order of the controllers. NTIS

CAUSAL REASONING FOR MODEL-BASED PROCESS SUPERVISORY CONTROL Ph.D. Thesis - Inst. National des Sciences Appliquees, Toulouse [RAISONNEMENT CAUSAL POUR LA SUPERVISION DE PROCESSUS BASEE SUR DES MODELES]

Kouamana Bousson 1993 141 p In FRENCH Prepared in cooperation with Centre Hospitalier Univ. Rangueil, Toulouse, France

(LAAS-93241; ETN-93-95015) Avail: CASI HC A07/MF A02

The causal approach is used to model natural and man-made physical systems. Human beings tend to have a causal view of physical phenomena. A reasoning formalism based on the simultaneous use of the concept of causality and first principles is proposed. A process is represented as both a causal network of interacting qualitative automata influencing one another, and analytical equations which are non-causal by nature. A qualitative automaton captures both the dynamics of a process variable and the necessary knowledge to supervise it. To represent the knowledge for the process behavior interpretation, the notion of process pattern is presented. A process pattern is a space subdomain which indicates a significant and stable behavior of the process with regard to the aims of the supervision. The proposed formalism allows us to automate knowledge acquisition about influences, combine influences automatically from the linguistic description of the causal relations among the process variables, predict the behaviors of the process, and to provide a geometric interpretation of the process evolution. The formalism gave rise to a causal engine, implemented in UNIX environment. Causal engines served as a decision support system for the supervisory control of a fedbatch fermentation process for alpha-amylase production. The genericity of this engine makes it possible to be used for gas turbine behavior prediction and diagnosis. ESA

PHASING STRATEGIES OF THE HERMES TYPE SPACE SHUTTLE: ITS OPTIMIZATION CONSIDERING THE THRUST FAILURES Ph.D. Thesis - Toulouse Univ. [STRATEGIES DE PHASAGE ORBITAL D'UNE NAVETTE SPATIALE DE TYPE HERMES: OPTIMISATION ET PRISE EN COMPTE DES PANNES DES MOTEURS]

Sang Ryool Lee 1993 127 p In FRENCH

(LAAS-93242; ETN-93-95016) Avail: CASI HC A07/MF A02

The space rendezvous problem between a space shuttle and a station is discussed. The orbital phasing consists in reducing initial angular gap and distance between the shuttle and the space station and transferring the shuttle on a near circular target orbit, located a few kilometers below (or above) the space station. Phasing strategies of the Hermes type space shuttle in front of the stochastic aspects are optimized. The performance criterion is to minimize the operational cost. This is a stochastic, nonlinear and mixed variable optimization problem with constraints. Strategies for analyzing the stochastic aspects with different numbers of thrust are described. The developed models permit an analysis of thrust failure problems and also the definition of a robust strategy regarding the stochastic aspects. ESA

LEARNING CONTROL OF LARGE-SCALE SYSTEMS

Q. H. Wu Jun. 1993 22 p

(MATHS-Rept-A-186; ETN-93-94904) Avail: CASI HC A03/MF A01

The application of interconnected learning automata to Learning Coordinated Control (LCC) of a large-scale, electrical power system is presented. The interconnected learning automata with variable subsets of control actions are used to optimize parameters of distributed local controllers to improve power system stability based on an integrated performance index. Simulation studies were carried out based on a mathematical model of a four machine power system. Results obtained for simulation studies are presented. The potential application of the method to control a large scale system is shown. ESA

NOTES ON MULTI-STEP AHEAD PREDICTION BASED ON THE PRINCIPLE OF CONCATENATION

J. A. Rossiter Jun. 1993 7 p

(MATHS-Rept-A-189; ETN-93-94907) Avail: CASI HC A02/MF A01

A more efficient application of Generalized Predictive Control than that most common in the literature was proposed by other authors. The purpose of the work is to compare that algorithm with two algorithms, already in the literature, and also with the original algorithm and to demonstrate that they all reduce to the same algorithm. The results show that two algorithms are more efficient in the nonadaptive case, and that one algorithm is not efficient in the adaptive case. ESA

PRACTICAL: PLANNING AND RESOURCE ALLOCATION IN C2-DOMAINS WITH TIME CRITICAL ALGORITHMS Final Report

C. W. dHuy and A. P. Keene Feb. 1993 96 p Sponsored by Ministry of Defence, The Hague, Netherlands

(FEL-93-B029; TD93-0304; ETN-93-94952) Copyright Avail: Issuing Activity (TNO Physics and Electronics Laboratory, P.O. Box 96864, 2509 JG The Hague, Netherlands)

A framework for planning/replanning using a scenario driven approach that centers on methods and techniques for plan generation, plan repair, and replanning with (partial) reuse of the original plan is described. The basis for the framework is a conceptual model of the (re)planning process and a knowledge partitioning that distinguishes between strategic, tactical, causal, and world knowledge. A temporal database management system is used to allow reasoning about the past and present as well as the future. The research culminated in the system PRACTICAL, demonstrating the (re)planning framework and incorporating the demonstrators CALIGULA and ALLOCATOR for resource allocation and scheduling respectively. A METHOD FOR ELIMINATING SKEW INTRODUCED BY NON-UNIFORM BUFFER DELAY AND WIRE LENGTHS IN CLOCK DISTRIBUTION TREES Memorandum Report

Henry M. Wu Apr. 1993 6 p

(Contract N00014-92-J-4097)

(AD-A270649; AIM-1422) Avail: CASI HC A02/MF A01

Non-uniformities in buffer delays and wire lengths introduce skew in clock distribution trees. Previous techniques exist for eliminating skew introduced by each of these causes, not both. This method uses a pair of matched variable delay lines to eliminate skew caused both by differing buffer delays and wire lengths. DTIC

EXPLORATIONS OF THE PRACTICAL ISSUES OF LEARNING PREDICTION-CONTROL TASKS USING TEMPORAL DIFFERENCE LEARNING METHODS

Charles L. Isbell Dec. 1992 81 p

(Contracts N00014-89-J-3139; N00014-91-J-4038)

(AD-A270836; AI-TR-1424) Avail: CASI HC A05/MF A01

There has been recent interest in using a class of incremental learning algorithms called temporal difference learning methods to attack problems of prediction. These algorithms have been brought to bear on various prediction problems in the past, but have remained poorly understood. It is the purpose of this thesis to further explore this class of algorithms, particularly the TD (lambda) algorithm. A number of practical issues are raised and discussed from a general theoretical perspective and then explored in the context of several case studies. The thesis presents a framework for viewing these algorithms independent of the particular task at hand and uses this framework to explore not only tasks of prediction, but also prediction tasks that require control, whether complete or partial. This includes applying the TD (Lambda) algorithm to two tasks: learning to play tic-tac-toe from the outcome of self-play and the outcome of play against a perfectly-playing opponent and learning two simple one-dimensional image segmentation tasks.
